We had always supposed that what made the *Revolution* peculiarly offensive to the friends of woman suffrage who finally started the *Woman's Journal* in opposition, was its avowed purpose to take and solicit aid from any quarter, and its actual alliance with George Francis Train and attempted conjunction with the Democratic party. This was judged, and with good reason, to be an unscrupulous policy, calculated to damage immensely the pretensions that woman's accession to the suffrage would usher in political purity. The conductors of the *Woman's Journal*, however, who are also the leaders of the movement in Massachusetts, have lost their equipoise in calculating their possible influence in the coming election in that State. Their Association was convened in Boston last Thursday, "to consider their political duties in the coming campaign," though it very soon appeared that the callers of the meeting had framed a programme which they preferred should not be considered too vigorously. Resolutions were reported declaring that the time had come to refuse support to any political candidates not pledged to woman suffrage, and to substitute for them candidates who were thus pledged. The prohibition and labor-reform parties were reproached with having ignored the woman question; and the Republican and Democratic parties were warned that if they did likewise at their approaching conventions, a fifth party would either take the field or give its votes to Mr. Phillips. How to deal with this gentleman caused the Convention its greatest embarrassment. Some of the speakers wished to nominate him outright—Mr. Stephen Foster, that the Association might do a plain duty frankly; Rev. E. D. Winslow, that it might strengthen the prohibitory side. But though this confessedly met the views of the leaders, they were admonished to be prudent by the hope of winning over the Republicans, and they finally consented to withdraw the ambiguous resolution which held Mr. Phillips *in terrorem* over the Republicans and Democrats alike.

It was during the debate on this knotty point, in which Governor Claflin's interest was represented by Mr. W. S. Robinson, that Mrs. Lucy Stone, inheriting the mantle of Miss Susan B. Anthony, said, "If her house was on fire, she would take the engine and hose that could be most easily procured," and explained this to mean that in a certain contingency she could without scruple vote for a Democratic candidate for governor. She also showed the hand of herself and her associates by arguing that "if, by voting for Mr. Claflin, who was a woman's-rights man and gave them his money, they could get all the votes they needed, it would be better than to vote for Mr. Phillips, who was the nominee of a small party, by which act they could not, perhaps, get all the votes they needed." Mrs. Livermore took the same ground, but not without a considerable tussle with her "heart," which she had to tell to "be still," but which continued, nevertheless, to "tug" in favor of Mr. Phillips till the end of the evening session. She expressly stated that it was by Mr. Phillips's own advice that they refrained from nominating him. It is needless to wish that this worldly prudence may meet its own reward, and that the faith which could not wait to work out a change in the opinion of a majority of the voters of Massachusetts, may reap from its intriguing nothing but mortification. The arrangement reached was a perfect juggle. The women have no votes of their own, the number of votes they can influence is indefinitely small; Governor Claflin's favor cannot introduce their plank into the Republican platform on which, as we write, it is even doubtful if he himself will be allowed to stand as a candidate; and finally, Mr. Phillips himself, if elected by any remote possibility—such as the exhibition of political sense by the Democrats, whose first object it should be to break up the Republican succession—will by no means have a legislature at his heels on prohibition, labor reform, or woman suffrage. So that, altogether, the women could scarcely have made a more discouraging show of their actual or prospective capacity for politics. The hack politicians must grin with delight over their performances.

INTERNATIONAL IGNORANCE.

To rush at an enemy without having any knowledge of his actual strength is dog's work. Yet this is precisely what the French have been doing. International ignorance, as might be expected, has always been great. Nations have always had much difficulty in understanding each others' languages, wants, aspirations, and resources. And the greatest and mightiest nations have been those least gifted in this respect. Perhaps it was habitual ignoring that made them so ignorant. At all events, this supercilious ignoring and this ignorant superciliousness seem to act as a providential corrective for national greatnes, inasmuch as it causes those to stumble who carry their noses too high to see the stones on their path. Those nations, on the other hand, which have tasted most frequently the cup of adversity, not only show a livelier interest in other nations' concerns, but seem to have also greater facility in understanding them. In Germany, this national *altruism* was carried to an almost ludicrous and vicious extent. There was a time when the leading newspapers of Germany devoted their first pages to the discussion of Argentine or Peruvian politics. The *Augsburg Gazette* began invariably with La Plata, and wound up with Bavaria. Even now, no German atlas betrays its nationality (as American, French, and English atlases do) by the order and scale of the maps. They generally begin with Spain, and after Belgium and Holland, say the sixth or seventh page, comes the map of Germany. In the same spirit history and geography were taught in German schools. There are first-rate schools in Prussia where, twenty-five years ago, not one word of Prussian history was taught, although the boys were expected to be well versed in Athenian politics and in the genealogical maze that led to the Wars of the Roses. This is no longer so; but it is easy to see that, in a country where such things were possible, the people must have a natural and irrepressible disposition to look beyond their horizon. By special training, this power of what may be called intellectual sympathy has been developed into a distinctive national trait. It has never been very conspicuous, even among the Germans, but it is more so among them than in other nations. The Italians, too, possess it, notwithstanding their want of positive information. And it is not improbable that this curious disposition is one of the many reasons why the two nations most highly blessed with it have continued so long to be the political pariahs of Europe. The greatest and most powerful nations have always shown a certain incapacity when called upon to consider and to study the long-ignored affairs of other nations, but nowhere has this international ignorance been more successfully cultivated than in France. We say cultivated, because it is impossible to deny that the leading men of France, who seem to have a special talent for self-deception, have done all that mortal men can do to spread error, infatuation, and prejudice among those whom they were called upon to lead, to instruct, and to enlighten. It matters little whether we listen to Ollivier or to Favre, to Prévost-Paradol or to Rochefort, to Thiers or to Louis Blanc, to About or to Victor Hugo, we always meet with the same kind of brilliant incapacity, where common-sense shines by its absence—we meet with the same strange mixture of vanity and error, of conceit and deceit, of wit and wrath, of physical defiance and moral cowardice, with which the history of France has made us familiar, and which renders discussion in France so often appear as hopeless a task as ruling.

Look at French literature. The style is the man—and French style is splendid, indeed. But was it not Sir G. Cornewall Lewis who said that he never yet read a French book whose contents were as good as its style? This is a sweeping assertion. To American readers Tocqueville must at once occur as a brilliant exception. But there is truth in the saying, for all that. It is the same with the press. Take the leading articles of the leading Parisian journals. They lead, indeed; but whither? Compare them with the political reviews of even a third-rate Italian paper. These, too, may contain false views, but they are generally written with a candor and with a maturity of judgment such as you would seek in vain among the spirited rubbish that fills the "attic" columns of a Paris contemporary. The French press has sadly failed in its mission. It has become an instrument of error. It is the beak through which France crows. It lives on the lowest passions of the people, and feeds it, in return, with the silliest illusions. It cajoles, amuses, and flatters the people, but takes it for granted that ignorance is bliss to them—not to speak of the ignorance of the writers themselves. That a Parisian publicist, in borrowing from the English papers some information about the "Staff of the Third Prussian army" should entertain his readers about "le Général Staff," is bad enough; but that he should at once volunteer some further information concerning General Staff by adding the battles in which this personage distinguished himself in Bohemia, betrays an unprincipled as well as an uncultivated mind. Quite recently, the *Figaro* contained an effusion in which the German invaders were called hungry wolves coming from barren wildernesses and inhospitable forests, where art and literature, comfort and prosperity, were unknown. About the same time, a Prussian invader surprised a native by giving him some valuable information concerning his own province. Now, the latter performance may have been the result of some special cramming on the part of the officer. But why cannot French writers do a little cramming also? Any gazetteer would have informed the *Figaro* that the country which the French had wished to invade is, notwithstanding the "glorious vestiges" left there by their forefathers, one of the most fertile and prosperous regions of the earth.

One cannot reperuse the history of the present war, from Gramont's speech of the 6th of July to Jules Favre's circular of the 6th of September, without being forced to some very painful conclusions about "la grande nation." But a few months ago Jules Favre signed a programme reproaching the Emperor with not having "avenged Sadowa." To-day, Citizen Favre says he is not responsible for the war, and treats the Germans as aggressors. The Paris *gamins* who shouted '*à Berlin*" in July take probably the same view of the matter as Jules Favre.

But more remarkable than the looseness of thought in the Republican leader has been the blindness and incapacity shown by Imperial diplomatists before the outbreak of the war. There must have been at least six of them residing at the various courts of Germany, not to speak of their military *attachés* and the vast number of consular agents whom long residence and intimate connections ought to have made familiar with German opinion and its modes of utterance. Yet the joint acumen of all these gentlemen could see nothing but what any hasty tourist might have seen. That the Southern Germans did not like Prussia, and that the liberal Prussians did not like Bismarck, was known to every schoolboy. But diplomatists are supposed to have a special talent for looking round the corner or below the surface. If paid professionals can see nothing but what other people see *gratis*, their services might be dispensed with. In this case, it was their duty not only to report on the anti-Prussian feeling in the South or the anti-Bismarckian feeling in the North, but to find out how far these antagonisms were likely to go, and how far an invader might rely on these forces as anti-national agencies. "*On m'a trompé*," said the Emperor, after the battle of Wörth. But a personal ruler, being a would-be god, has no business to be deceived, not even by himself. By being deceived so easily, he has shown himself a true Frenchman, sharing almost all the prejudices, passions, and illusions of his countrymen.

These illusions are many, but, as far as they relate to the present war, they may be summed up in the following four: The first is a purely ethnographical one. That the French should claim the Rhine as their natural frontier, might be called cool or impudent. But that they claim it on the ground of nationality is an extraordinary piece of ignorance. Yet all the *élite* of French thinkers have been guilty of it—Favre and Crémieux, Thiers and About, Montalembert, and Chevalier the enlightened champion of free-trade, nay, even old Victor Hugo, who told us but the other day that international frontiers ought to be abolished, has invoked blessings on him who would snatch Rhineland from Prussia. Again, that the French should call the Alsatians their countrymen is not unreasonable, considering that they have succeeded, by their amiable manners and by the spread of bigotry and ignorance, in estranging the hearts of these people from their real fatherland. But when they go further, and call the Strasbourgers "blood of our blood" and "flesh of our flesh," the saying is as accurate, though not so witty, as M. Grousset's, who, in answer to the judge's question, said he *might*, for aught he knew, be a relative of Pierre Bonaparte. French writers call Landau "cette ancienne ville française." Why not Rome, too? It would be worth one's while to look into French school-books.

The second national fallacy of the French is the time-honored, old-fashioned principle that what is good for others must be bad for France. The union and power of France presuppose a divided Italy and a divided Germany. M. Thiers is the principal advocate of this doctrine, which is tacitly accepted by most Frenchmen, and therefore never discussed. If it were, it might possibly occur to some critical minds that such anxious desire for relative greatness betrays absolute smallness.

The third fallacy is the French belief in French invincibility. France has often been beaten, and even invaded; but it is, nevertheless, "invincible," and, more than that, it is the only nation that can conquer. Prussia defeated Austria in 1866; but that could never have happened had not Louis XIV. driven away the Huguenots, twenty thousand of whom emigrated into Prussia. No wonder if there is something good even in Prussian blood. Considering that France neither fought Russia nor Austria, nor even Mexico and China, without having the help of at least one ally, the faith in present French invincibility can rest on nothing but the military successes in Rome, Algiers, and Cochin China.

But by far the most incorrigible and most mischievous of all French fallacies is the belief that France is the apostle of civilization. Louis Blanc once said that France had a large heart and natural expansiveness, which caused her to impart to others the blessings of her civilization; and a French exile living among cold-blooded city merchants may well be pardoned for making such a home-sick remark. Yet, a learned historian ought to know that all extra-European attempts at spreading French civilization have been either failures or sterile successes. In fact, this French expansiveness is so feeble that it cannot even reach the rural districts of France itself, to which the blessings of the Boulevard civilization are all but unknown. France seems to be shrinking rather than expanding. It has its fits of world-embracing generosity, but they are morbid and transient, and often dangerous to bystanders. Is it ungracious to say that *beneficia non obtruduntur*, and that two parties are necessary even to an embrace, which otherwise would degenerate into garroting? The only French war that was waged for a truly grand idea and from truly generous motives (Nice and Savoy notwithstanding), was intensely unpopular in France. It is the one bright spot in the history of the Second Empire, and quite unique in the dark annals of the world. Yet France is very far from being proud of it, and her leading politicians rue it.

Unquestionably, we owe much to France and to the genius of French civilization. Above all, we are deeply indebted to her for her "French polish" and her revolutionary yeast. We shudder at the thought of what Europe would be without these refining and quickening agencies. But all this belongs to the past. France seems to have given us all she could afford. Her thinkers have nothing new to teach us. Her philosophical ideal, Comte's intellectual Papacy, is nobody else's ideal; and when, two months ago, she offered to carry a new batch of *idées civilisatrices* beyond her frontier, we had a right to decline the offer without thanks. The Second Empire has given us Italy, and womankind is indebted to it for the crinoline and the chignon. The church, too, is its debtor. But the Second Empire is not France. Napoleon has fallen, and even Rouher's famous "never" has proved to be a finite term. The little god in Rome, born under the auspices of French civilization, has to pack up his earthly insignia like his Imperial protector. If the Third Republic can evolve no better "ideas" than the Second Empire, France must make up her mind to renounce her long-lost leadership. Her capital may still continue to be a centre of levity, but the centre of gravity will have to be shifted eastward. And whatever else may happen, it will be a relief to know that Europe can again be "tranquil," even though France should be "dissatisfied."

HOW THE GREAT CHANGE AFFECTS THE NATIONS.

From Moscow to Madrid, the fall of Napoleon III. is felt and declared to be fully deserved, and that by crime, folly, and imbecility. Expressions of sympathy with the fallen "*Décembriseur*," outside of some official organs still awed by his shadow, are as rare as non-clerical approbations of the Infallibility dogma outside of Rome and Ireland. Entirely different, however, is the effect produced on the astounded nations of Europe by the sudden downfall of French leadership on that continent. This effect is most manifold, being in the various countries modified by national rivalry or affinity, hope or apprehension. Leading France—and we speak here chiefly of France as she was of late under the Napoleonic rule—was an enemy to Germany, a rival to England, a ready ally to Austria and Hungary, a friend—though an exacting and untrustworthy one—to Italy, a possible antagonist to Russia, a support to Turkey, a menace to Belgium and revolutionary Spain, a hope to Poland and Denmark. Her leadership being gone, and Prussia—or call it Germany—having suddenly risen to a more central, evidently more substantial, and more overshadowing hegemony, expressions of sentiment on the part of the various non-belligerent European nations, aside from an almost universal feeling of pity for prostrate and helpless France, are not only divided, but generally far from betraying satisfaction or a hopeful view of the probable consequences of the change.

Fighting Germany, of course, is jubilant, for hers is the victory, the glory, and the future; and England—Protestant, Teutonic, and sea-girt England—is quite glad to see the sceptre of Continental power transferred from the hands of her Catholic, semi-Celtic, and semi-maritime neighbor to those of a people to whom the thought of attempting a descent on Ireland or disputing the rule of the waves must ever remain foreign. But Spain, though now freed of all fear of French intervention in her affairs, and not in the least threatened by the growth and ambition of Prussia, is mainly affected by the common humiliation of the Latin race, and by the apprehension of its common decadence in face of the triumphantly advancing Teutonic powers, both in the Old World and in the New. The same feeling of deep humiliation and the same gloomy view of the future manifest themselves in Italy, in spite of the freedom now gained of independently settling the affairs of Rome; and, in addition to them, a pang of remorse for abandoning a sister nation, and that lately a benefactress, in her supreme need, and the fear lest the Hohenzollerns, seated on the throne of united Germany, may one day revive the aggressions of the Hohenstauffens. Belgium, Switzerland, and Holland felicitate themselves on their strict observance of neutrality; but they, too, are far from rejoicing at a change which has half-destroyed the equilibrium between Germany and France, on which rested their security and independence, and that in favor of the party whose expansive ambition may not become satisfied before it reaches the mediæval limits of the German Empire. Denmark mourns her blasted hope.

In the various provinces of the Austro-Hungarian Empire, the thunders of the Prussian victories have met with widely different echoes, and but few of these are purely sympathetic. The Germans, whose political supremacy in the councils of the Cisleithan division of the Empire was greatly shaken by the advent of the Potocki Cabinet, give full vent to the national pride to which the great deeds of their brethren entitle them, and thus create no small embarrassment to the policy of Beust, Andrássy, and Potocki, which is known to have been so little agreeable to the Court of Berlin; but those manifestations, whether made in the eloquent columns of the *Neue Freie Presse*, the old *Presse*, the *Fremdenblatt*, and other journals of Vienna, in the "Wacht am Rhein" choruses of the singing associations, or in political meetings, are not so much expressions of a decided leaning towards Prussia as of national self-consciousness, in opposition to the anti-German tendencies of the Slavic populations of the Empire, as well as to the anti-Prussian inclinations of the Imperial Court and its ministerial advisers. The Czechs, on the other hand, who but lately were so defiant in their deadly hostility to centralized Cisleithan Austria, have considerably lowered their tone, and, despairing of ever curbing the spirit of their German fellow-citizens by intimidation, have even stooped to negotiate publicly with them, although in vain. Greater still is the consternation and despondency of the Galician Poles, to whom the outbreak of the war opened the bright vista of a Franco-Austrian alliance against Prussia and Russia, in which they expected to form the vanguard of powerful armies marching to deliver Warsaw, Wilna, and Posen. Besides, the attachment of the Poles to their old allies and companions-in-arms, the French, is so deep-rooted that we find no exaggeration in the mournful words of the *Glos Wolny* (Free Voice), an independent Polish democratic paper, in which it gives utterance to grief at the French disasters such as only the news of Polish reverses ever inspired. In Hungary, the conservative press had, even before the day of Sedan, given loud expression to the fear that the Austro-Hungarian Empire would soon be entirely at the mercy of Prussia and Russia, but the liberal journals, like the *Hon* (Fatherland), which were in favor of a sincere neutrality, continue to look at the events from the standpoint of impartial observation, exulting at the fall of Napoleonism, and, while admiring the Prussians, warning them against arrogance in and after the hour of victory.

But what is most curious to observe is the attitude of the Russian press. Almost all the influential journals, both of St. Petersburg and Moscow, not only openly sympathize with France, but also betray a real fear of Prussia. She is expected to do with Russia after subduing France as she did with France after subduing Austria. She is expected everywhere to take the side of the German element against the Slavic. *Birzheviya Vyedomosti* ('Change News) trembles for Prague; *Moskovskiya Vyedomosti* (Moscow News) calls upon the Government to fortify Kiev and other towns in the Western provinces; *St. Peterburgskiya Vyedomosti* (St. Petersburg News) exerts itself to prove that the conquest by Prussia of the Russian Baltic Provinces is a much harder task than believed, and that, if conquered, they could not be kept by her; the *Golos* (Voice) alone has the courage to demand that Russia should dictate limits to Prussia's aggressions in France, or at least ask the rescinding of the anti-Russian stipulations of the Treaty of Paris as a compensation for her neutrality. The most sensible of these papers, *St. Peterburgskiya Vyedomosti*, illustrates the *Golos's* hatred of both belligerents by comparing its wishes with the wishes of the Jew who said: "May the Cossack"—the Russian journal changes this word into "German"—"swallow the Pole, and be suffocated in doing it." This bad temper of the Russian press is owing chiefly to its bad conscience concerning the affairs in the Baltic Provinces, against the German population of which it has so long carried on a kind of a crusade, which led the Government to more serious persecutions, and finally drove the Germans to an almost disloyal opposition. In part, however, it is the result of bitter envy; for never has the lameness and backwardness of illiterate and semi-barbarous Russia been as flagrantly conspicuous as it is now, in the light of the wonderful successes achieved by the intelligent and disciplined prowess of the Germans. Russia is now both afraid and angry, but we hope she may soon be in a mood to learn and imitate. And so may other nations—on both continents.

A NEUTRAL OPINION ON THE "ALABAMA" CASE.

If the *Alabama* case were referred to arbitration, it would have to be to some German Government, or to Switzerland, or to Italy. England would hardly agree to leave it to Russia, and there is no power outside these in which either of the parties to the controversy would have any confidence at all, either as regards intelligence or independence. Now, when a question of this kind is submitted to the arbitration of a government, what the government does is simply to refer it to one or more of its ablest jurists, and adopt their finding as its own. If this case were left to any German government, there are two men in Germany to whom it would almost certainly be referred, Drs. Von Holtzendorff and Bluntschli. They are both amongst the weightiest living authorities on questions of international law, and both enjoy a world-wide reputation. Both, too, have been importuned for an opinion on the *Alabama* case, and both have until now refrained, probably from a dislike to even the appearance of officiousness. Dr. Bluntschli has, however, at last broken silence, and publishes an elaborate opinion on all the points raised, taking Mr. Sumner's speech as his text, in the last number of the *Revue de Droit International.* Before giving his own summing up of his decision, we may be permitted to recall to the recollection of our readers that we have at various times in these columns, during the past year, taken the ground:

1. That the recognition of the South as a belligerent was a discretionary act, and that, although the United States might go to war about it, as it might about anything or nothing, all talk of making it the matter of complaint before a tribunal was simply absurd. General Grant wisely abandoned it, by implication, in his first message about Cuba, in spite of the labor expended on it by Messrs. Seward and Sumner.

2. That England had committed a breach of neutral duty in letting the *Alabama* escape, and for this was bound to atone to the United States, at least in damages; and that her concession of belligerent rights to the South only made this neutral duty all the plainer.

3. That although she ought to make some sort of moral as well as material satisfaction, it was useless, and, because useless, mischievous, to expect and insist upon a formal apology; that a formal apology from a first-class power, for things done or left undone by the Government itself, would be something unprecedented, and something to which no people of the standing and pretensions of Great Britain would submit, except as the crowning humiliation of a disastrous war.

Now hear Dr. Bluntschli. He lays down the following propositions, which we translate literally:

I. "The recognition of the Southern States as a belligerent power, and the declaration of neutrality on the part of Great Britain and France, did not constitute a violation of international law. In deciding to act thus, the European states only exercised a right, whatever the serious objections which might have been offered to the political opportuneness of its exercise. The United States, then, are not authorized, however calamitous for them the results of that recognition, to exact for it from Great Britain or France any satisfaction or reparation, as this could only be done by denying the right.

II. "Supposing the charges made against the English Government relative to the armament of the *Alabama*, and her unimpeded departure from an English port, to be well founded, we have before us a case of culpable non-performance (*inobservation fautive*) of the duties of a neutral and friendly state towards the Union, and the latter has a right to demand satisfaction and reparation from Great Britain.

III. "The owners of American ships and merchandise destroyed (by the *Alabama*) have no right of action in damages against the British Government, but the Government of the Union may watch over and protect their interests in settling the pending controversy with Great Britain.

IV. "The true solution of the difficulty consists in a combination of material reparation for the compensation of American property-owners with a moral guarantee, both for commercial and maritime relations, against the recurrence of similar injuries. The first of these objects would be attained by means of a fair pecuniary compensation, to be paid by Great Britain to the United States, for distribution amongst the persons injured; the second, by a new declaration of the duties devolving on neutral and friendly states, so as to hinder as far as possible the abuse of neutral territory for the organization of military expeditions."

In the argument by which Dr. Bluntschli prepares the way for these propositions, he lays it down that to the recognition of the South there was a *political* as well as a *juridical* side, and although it may have been an unfriendly act, as regarded the United States, this made it simply a "political error," but by no means necessarily an "injustice." For the first, a government is responsible only to its own people; for the second, to the foreign state which it injures. The recognition was justified, he holds, by the fact that the South had, when the proclamation was issued, all the required marks of belligerency, namely—(*a*) "in being *de facto* organized as a military force; (*b*) in observing in the conduct of hostilities the laws of war; and (*c*) in believing itself to be in good faith struggling, in the character and capacity of a state, in defence of its public right." Mr. Sumner's "pacific blockade" he disposes of, as President Woolsey did, by alleging that there is no such thing known to international law; there is such a thing as a blockade "without maritime war," but not "without war." The escape of the *Alabama* he treats as violation of international as well as of municipal law, and he denounces her mode of carrying on the war as "barbarous;" but Mr. Sumner's doctrine of "consequential damages" he sets aside, on the ground so often alleged against it, that no such damages are in a case of this kind capable of being ascertained, and the connection of England with them is too "vague" and "uncertain" to be made the subject of judicial enquiry. England's offence is not an *act*, but an *omission* in violation of law. She did not equip and send out cruisers, but failed to hinder their equipment and departure, and therefore her fault has only an indirect, and by no means a direct, relation to the depredations committed by the cruisers.

As regards the mode of reparation, he treats the idea of cession of territory, which has been talked of, as one which, whatever its merits, no arbitrator could for a moment entertain. If any such cession is made, it must be made voluntarily by Great Britain, or under compulsion through war. To a formal apology, there is no *juridical* objection. A judge might properly order it to be made, but there is a fatal *political* objection to it. "A formal confession of culpability," he says, "however praiseworthy in the eyes of morality and justice, is unconquerably resented by the nation in fault as an act of unworthy weakness. This alone is a sufficient reason for our being unable to exact it from the government of a great power." He therefore decides on "the payment of a sum of money," and a "renewed declaration of principles destined to assure in future respect for international law, and to guarantee the practice of justice throughout the civilized world."

Now, would it not be in the interest of all good causes for the Government at Washington, having given up the wearisome work of proving and enlarging upon, over and over again, the guilt of England, to settle down on this or on some view of its own rights or wrongs fortified by the opinion of neutral jurists, and then urge it persistently and firmly till the case is settled? What is gained by delay that can compensate for the gross injustice of letting the sufferers by the *Alabama* depredations die off without compensation?

RAILROAD SUBSIDIES.

Discussions on points of constitutional law would be far more interesting were they not well-nigh interminable. We now have so many constitutions and so many courts to expound them, that perhaps the wonder is rather that a recognized result is ever arrived at, than that the process is a long one. Here is the legal-tender law. Rather more than a score of tribunals, State and national, have, we believe, since 1862, affirmed the constitutionality of this act; and yet the last decision in 1870 has cast the gravest doubts upon the correctness of all those which preceded it. This instance of the uncertainty of the law is striking enough, but it is nothing to another and yet more recent one. Most persons have heard of the doubt entertained as to the constitutionality of the acts authorizing towns and cities to aid in the construction of railroads which were to belong to private companies. It was asserted that this was an appropriation of public funds to private uses, and was not within the legitimate taxing powers of legislatures. For nearly twenty years the question has been incessantly argued by lawyers and decided by judges. In 1853, the Supreme Court of Pennsylvania, in the Sharpless case, unanimously affirmed the constitutionality of this class of acts. That court was then a strong one, and State after State accepted the law laid down by it. For years the question was looked upon as settled. Nothing could have been further from the truth.

The law in the case is perfectly simple; as usual, the difficulty lies in its application. The point is not uninteresting, and the judicial discrepancy arrived at is edifying in the last degree. All authorities agree that, in the absence of constitutional restrictions, a very large discretion rests in the legislature as regards the objects for which money may be raised by taxation. No taxes can, however, legally be imposed, except for public purposes; for a legislature, under the name of taxation, to take the property of one portion of the community and give it to another would, the courts say, be robbery and not taxation. The judiciary, however, they add, will be very loth to interfere in a matter thus reposed in the discretion of a co-ordinate department—indeed, with one voice, judges all declare that not for worlds would they even seem to usurp an authority which does not belong to them. A tax to be declared unconstitutional must, therefore, be so plainly, palpably, and grossly an appropriation of public money to private uses as to be a mere cover for fraud—in fact, a breach of trust so glaring as to be but a single step removed from robbery. So far, all is clear; there is not even a single dissenting voice. The abstract law being thus established, it only remains to apply it to the particular facts. Are railroads, the property of individuals, but subject to regulation by law, public or private concerns? For years, court after court decided that the legislatures must settle this question; that if they declared railroads public uses they became so, and money raised by taxation might legally be applied to their construction. Practical evils ensued from this decision. Heavy municipal debts were everywhere incurred; certain towns and cities ruined themselves by building railways before they were needed; legislatures got lax and corrupt in parcelling out railroad subsidies; and so, finally, a change of popular feeling resulted, and this led to a great awakening of the judicial mind. The result, in a word, was that in certain of the States, of which Michigan is most noticeable, the reasoning of a score of courts and the decisions of twenty years were pronounced wholly fallacious and wrong. A system sanctioned no less by time than by the authority of court upon court, which the popular mind had accepted, and upon the faith of which millions had been invested, was thus constructively declared to be such a gross, plain, and palpable appropriation of public means to private uses that no one could fail to see at first glance that it was nothing less than legalized robbery.

Such a statement of a legal complication seems scarcely credible. Of course it was not put in this blunt way, but this is the undisputed logic of the decisions. No exercise of the taxing power by the legislature will be adjudged void by the courts unless it presents a clear, indisputable infraction of the Constitution. The municipal aid acts, say the recent decisions, are unconstitutional; he who can may escape the logical inference. In Iowa, the question has been decided both ways. In Michigan, it has been decided one way only. These States, however, occupy a position somewhat akin to that of the one reasonable juryman persecuted by his eleven intractable associates. It certainly does call for some courage in a court to decide that a question, which twenty similar courts had decided the other way, cannot admit of a doubt; but it is done, and, as the result of a discussion extending through half of the life of a generation, the question of the power of legislatures to authorize towns to aid in the construction of railroads is no more settled than is the authority of Congress to declare Government notes a legal tender.

So much for the legal aspect of the question. We had not intended to give so great a space to it, but the temptation to describe so curious a complication is not easy to resist. The practical, not the legal, solution of the question should be the real end in view. The popular feeling in regard to municipal aid to railroad construction is running as thoughtlessly in one direction now as it did in the other a few years ago. At present, the tendency is to cut the system up root and branch, just as not long ago it was to subsidize everything. The tide first turned in Pennsylvania and Ohio. The practice had there been pronounced constitutional. An amendment met the difficulty and put a stop to it, but not until one-half of each of those States was bankrupt. Iowa, less scrupulous, or perhaps more heavily burdened, next disgraced itself by a resort to judicial repudiation. The court which decided the law to be constitutional was turned out when the elections came round, and a new court was selected which declared the decisions of their predecessors to be no law at all. Illinois, following the example of Pennsylvania and Ohio, has engrafted inhibition into her new constitution, and Michigan has judicially arrived at the same result. Thus the case stands—the tendency being distinctly to a reaction from indiscriminate subsidizing to absolute inhibition.

After all, is this a practical way of dealing with a really important question? Every one concedes that the position of this country is exceptional—in fact, any reasoning being has but to look around to be forced to this concession. Railroads with us are an absolute necessity. In old-settled countries, of dense population, short distances, and good roads, they are comparatively matters of luxury. In Europe they are modern innovations—people always had got along without them, and could have continued to do so. It is wholly otherwise with us. The railway is our pioneer—it made the settlement of the country possible. Indeed, we may be said to have no other roads. Our distances are railroad distances; practically we have no other machinery of intercourse, absolutely no other conveyances to our markets. All over the world municipalities or governments have always been obliged to provide some means of intercommunication, and this is the one means adapted to our circumstances. Our political system, too, is based on the principle of local self-government; each subdivision is left to judge of its needs and to provide for them, instead of looking to the great central power for an initiative. For us, therefore, to say that, under no circumstances, shall town or city aid in railroad construction, is like saying that in Europe the highways should always have been built and kept in order by private enterprise. Railroads, then, must be had by our people; if the law of supply and demand will produce them, well and good; if unaided private capital will build them, better and better; but railroads there must be. One might as well talk of having a city without streets.

Will our people, then, permanently accept these constitutional limitations which render all localities absolutely dependent on private enterprise for a prime necessity of civilized life—if not for civilized life itself? For the present, undoubtedly they will. Many farms are still mortgaged, the town debts are not yet paid, population is moving away from excessive taxation, and not a few corner lots, once promising, are now valueless. The fathers have eaten grapes, and the teeth of the children are set on edge. Yet it by no means follows that grapes in moderation are a bad thing, or that moderation is impossible in one's consumption of grapes. The roads have been built, and the burden they have created may be one now heavy to bear; but the country has got them, and in time will grow up to them. The system, much as it has been abused, has been productive of more good than evil. It is the abuses, then, and not the system, which need to be reformed altogether. Nevertheless, we are now going through the regular slow process by which results are evolved from the action of large masses of men. Here, too, as in the temperance question, it is action and reaction, with each swing of the pendulum less violent than the one before.

The true medium, if any exists, is what the common good requires. An effort at this was last winter made in Massachusetts. The Board of Railroad Commissioners of that State initiated, and the legislature adopted, a policy which has at least the merit of being founded on experience and reflection. The system thus introduced is a simple one. Any town in the State, of less than 12,000 inhabitants, is authorized by a general law, and without the necessity of having recourse to the legislature, to subscribe in aid of railroad construction within its limits; all subscriptions of this nature, at any one time outstanding, must not exceed five per cent. of the valuation of the town, and no subscription can be made except by a vote of two-thirds of those present, and voting by ballot and under the registry law, at a town-meeting called for the purpose. This is all. There seems to be but one difficulty in the arrangement. It is a mere statute limitation on taxation, not incorporated into the constitution of the State; as such, it is subject to all the dangers incident to popular manias and to legislative log-rolling. Yet, if once incorporated into the fundamental law, why would it not cut off all dangers of abuse, and secure to localities a great public need? If such restrictions had existed in Pennsylvania or Iowa, could their railroad-bond difficulties ever have arisen? While indebtedness is limited to five per cent., bankruptcy is difficult; as long as a two-thirds vote is required, the exceptional character of the appropriation is recognized, and the rights of property are guaranteed.

No constitution is now complete without some sort of an article in relation to railways. The most elaborate attempt in this way, though a very crude one at the best, is found in the new constitution of Illinois. Michigan has already copied its provisions. In these articles, as we before remarked, absolute inhibition of municipal aid is laid down. This is hardly likely to last, and whenever it breaks down, it is to be hoped that regulation will next be attempted. Meanwhile, we would recommend the provisions of the Massachusetts law to the consideration of all legislators hesitating between the two extremes. It is necessary neither to be without a railroad system nor to plunge into the slough of bonded indebtedness. Upon the constitutional question we believe that the voice of the Supreme Court of Vermont is the next in order. This will, doubtless, add somewhat to the existing uncertainty, but will yet contribute to the grand result, if it forces the question on the popular mind for intelligent discussion and final settlement. On the whole, we decidedly hope that it will join itself to the minority, as by so doing it will in the most effectual way bring the question to an issue.

NOTES ON THE WAR.

IV.

THE DEFENCES OF PARIS.

Quite a wide unfortified gap exists between the fortress of Mont St. Valérien, on the west of Paris, and the forts around St. Denis on the north. The tongue of land on which Mont Valérien lies is between the two branches of the Seine, the one running northeast to St. Denis, and the other, from the bend near this place, southwest. This tongue of land is about seven miles in length, from Mont Valérien to its most northerly point, and about two miles and a third in breadth. Recent reports in the daily papers state that temporary defences with torpedo obstacles are now in course of erection there.

Around and in advance of St. Denis are three strong forts: Fort de la Briche, on the west; the Double Couronne du Nord, on the north; and Fort de l'Est, on the east. These are about three miles from the fortified line of Paris. On the northeast and east of Paris there are, first: Fort d'Aubervilliers, about two miles southeast of Fort de l'Est, and one mile northeast of the most northerly point of the fortified line; Fort de Romainville, two miles southeast of Fort d'Aubervilliers, and also one mile from the fortified line; Fort de Noisy, somewhat over a mile nearly east of Fort Romainville; Fort de Rosny, one mile and a half southeast of Fort de Noisy, and about three miles from the fortified line; lastly, Fort de Nogent, nearly two miles east of south from Fort de Rosny, three miles from the fortified line, and one mile north of the Marne. These three last forts have each a hornwork for an outwork. They are situated on the heights which extend on an arc from Belleville, through Romainville and Rosny, to Nogent. Between Fort de Nogent and Fort de Charenton, about three miles and a half to the southwest, there are no other works except some redoubts thrown across the narrow neck formed by a remarkable loop made by the Marne not far from its junction with the Seine.

Looking at any good topographical map of Paris and its environs, with the fortifications surrounding it, two points at once present themselves to the military eye as the most assailable by a besieging force: the one at the northeast angle of the fortified line, the other at the southwest angle; and these for very simple elementary principles by which engineers are guided in planning siege operations. An attack on the first point would involve the necessity of taking the forts around St. Denis, Fort d'Aubervilliers, and those, at least, of Romainville and Noisy, before the inner fortified line could be approached. With respect to the second point of attack, the writer, in a communication, Aug. 30, to one of the morning papers, anticipating a possible attack upon it, took occasion to remark: "This point, although behind the Seine, is a quite vulnerable one. By paralyzing the fire of Forts Mont Valérien, Issy, Vanves and Montrouge, the last three of which are comparatively weak works, by a heavy incessant fire, *un feu d'enfer*, the fortified fronts, running northeast and southeast, that form this angle, might be rendered untenable by a powerful enfilading and reverse fire, thus making an opening into the city here quite practicable."

From the information that has come to us within the past few days, it would seem that the Prussian movements look to making their approaches on the city at this point. If it be true that General Ducrot has been obliged to give up the plateau that runs back from between Clamart and Fontenay-aux-Roses, and which is about of the same height as Mont St. Valérien, spiking the guns of the works there that he was forced to abandon, this will give the Prussians a great advantage, if they are enabled to hold this point, which is about five miles and three-quarters from the Tuileries and Louvre; just about the same distance that Mont St. Valérien is from the same points. Why the French should have neglected to occupy earlier and more strongly this very commanding position is somewhat singular, as its bearing on their positions was so obvious. The lesson they received in the siege of Sebastopol, in the heavy losses they met with in assaulting the advanced positions taken up and fortified by the Russians during the siege, particularly that of the Mamelon Vert, seems to have been forgotten by them.

D. H. M.

WEST POINT, Sept. 30, 1870.

ENGLAND.

LONDON, September 16, 1870.

IN recommencing my letters to you, after a short interval, during which I have been absent from England, I find myself hampered by the same difficulty as on the last occasion of writing. If my remarks are to reflect in any degree the prevailing tone of conversation, they must be confined almost exclusively to the war. Our attention is occupied to an unparalleled degree with the incidents of the great drama now being performed in Europe, and yet you will hardly care to hear remarks upon that subject from this part of the world. We enjoy no opportunities of information which are not equally open to you. I will therefore content myself with noting that English sympathies appear to remain in substantially the same condition as before. Of course, the German victories have encouraged such of their partisans as like to be on the winning side; and the *Times* is more confident than ever in the justice of the German cause, and takes a still loftier tone of compassionate advice in addressing the French people. To read its articles, one would never suppose that it had ever said a civil word about that enemy of the human race—the Ex-Emperor—far less, that it had been one of his most steady eulogists, and had exhorted the French people, in season and out of season, to be thankful for the blessings which they derived from his rule. The *Times*, in fact, adopts its habitual tone as of one who has been faithful to a good cause through many years of depression, and now at length sees it crowned with victory. To people not blessed with very short memories, that is not precisely the tone to which it has earned a right. The *Telegraph* follows the *Times*, though with rather less regard, if anything, for the claims of consistency. Meanwhile, there is a certain reaction amongst people of more generous sympathies. Those who regard a war as they would regard a prize-fight, merely as a trial of pluck, without regard to ulterior consequences, are naturally beginning to wish for a French success. They feel for the weaker side, be it right or wrong, and join hands with the class who have a dislike to Bismarck's policy and a jealousy of German aggrandizement. A curious manifestation of this kind of sentiment has proceeded from the Positivist Church. As Paris was to be the Rome of the new dispensation, and the French are the chosen people of the religion of the future, Mr. Congreve and Professor Beesley naturally regard their overthrow by the Germans as a great evil. They call upon English workingmen to sympathize with the new republic, now purified from the imperial stain, and use language which looks very much like an appeal to a general revolutionary movement. Mr. Congreve has adopted the mode of publication which, as Comte tells us, is to supersede the anonymous press, and posts a large placard upon the walls of London. He calls upon the workingmen to force the Government immediately to make war upon Prussia, and drive back the barbarian Teutons from the sacred soil. Professor Beesley condescends to publish his views in a pamphlet called "A Word for France," and explains the motives for this appeal. France is the land where the working-class has produced the truest martyrs and heroes; it is the most thoroughly revolutionized country in Europe; the freest from the antiquated superstitions of theology; and the natural leader of the world. It is intolerable that it should be overrun by psalm-singing troops from a Protestant country—for a Comtist, as you know, hates Protestantism with a special hatred. I do not mention these manifestoes as possessing any particular importance, but as a quaint illustration of the mode in which these prophets, of an almost infinitesimal fraction of the people, are rehearsing their part for the time when they shall have converted the world. Both the gentlemen I have named are men of marked ability and sincerity; but they certainly seem to show that singular want of humor which is, perhaps, a desirable qualification for the missionaries of a new faith. In any case, their doctrine will not be of much weight. The republican spirit in England is not at present strong enough to be much moved by sympathy for the new rulers of France. Our strongest wish is to keep out of the war ourselves; and our next that peace, when it comes, may be of such a nature as to hinder wars for the future. We certainly should not object openly, though we may privately disapprove of the acquisition by Germany of Lorraine and Alsace. Our private disapproval will, of course, count for nothing. There has been a good deal of talk about mediation; but it is and can be nothing more than talk, for a very simple reason. No terms can be mentioned which both parties would be ready to accept, even if the terms received our "moral support." The French will not give up Alsace because Englishmen think they ought to give it up, nor will Prussians refrain from demanding the cession from deference to our views. At the same time, we have made up our minds not to bring any arguments to bear of a more forcible kind, and cannot therefore expect to exercise any influence on the solution of the question. The mission of M. Thiers seems to be of no great significance; and, in short, it is pretty plain that we shall look on quietly, and let the French and the Germans settle their own affairs in their own way.

The more practical lesson which we are deriving from the war concerns our own military system. The other nations of Europe will, it may be presumed, speedily employ themselves in adopting some of the principles of the Prussian organization. It is highly probable that the most important work of the next session will be an attempt to do something of the kind in this country. At present, we are in the merely preliminary stage when indignant patriots relieve their feelings by writing to the papers, and when articles are written in so desultory and perplexed a fashion that it is hard to draw the discussion to any given focus. It is therefore premature for me to say anything on the matter; and I am content to prophesy that, in a few months, we shall be discussing after our ordinary fashion whether a little more tinkering and patching will be sufficient, or whether a really radical change is to be introduced.

The mention of our warlike speculations reminds me that I should not pass without a word the fearful catastrophe which has just occurred to the *Captain*. She was supposed to be the greatest triumph of marine architecture hitherto accomplished; she was an ocean-going turret-ship, provided with every possible improvement, capable of fighting her guns under any circumstances, of weathering every storm, and, as was said, of knocking our whole iron-clad fleet to pieces, with one or two exceptions, with scarcely any risk to herself. And yet, during a gale of no unusual vehemence, she capsized and went to the bottom in a couple of minutes. I must leave to nautical critics the task of determining to what errors in her construction this calamity was primarily due. All that I know is that we have to lament the loss of some of the ablest officers of the British navy, and especially of poor Captain Cowper Coles, the great advocate of the system, who had after years of labor succeeded in inducing the Admiralty to adopt his plans, and has now become the victim of his own invention. Since the loss of the *Royal George*, immortalized by Cowper, nothing so melancholy has happened in the British navy. It is impossible to add anything to the notice of a catastrophe so complete and overwhelming.

Let us endeavor to diverge a little from these melancholy topics. There is one personal piece of news on which I must venture to say a few words. Professor Jowett was recently elected Master of Balliol College. I think that no appointment of its kind has ever given more general satisfaction. I may explain, for the benefit of your readers who may not understand the intricacies of our college system, that the headship of a college is about the most enviable piece of preferment to which an English clergyman can aspire. The income varies considerably, and I do not know what is the value of the Mastership of Balliol. In any case, however, it secures a dignified and permanent position to the fortunate holder, and (what will be no recommendation to Mr. Jowett) involves next to no duties. It is about the nearest approach to the comfortable sinecures of former times which survives in these degenerate days. This being so, and the appointment resting with a small body of fellows, masters are generally elected from motives of private friendship, without much reference to merit of any kind. Let me tell you a short anecdote, which will illustrate the system better than many words. Some ten years ago the headship of a college was vacant at Cambridge. Five fellows were the electors. Two of them, A and B, were candidates. A, being a gentleman of delicate feelings, did not like to vote for himself, and said to B (his intimate personal friend), "If you will vote for me, I will vote for you." The nature of B's reply is matter of dispute; but it is not disputed that A considered his proposal to have been accepted. On the day of election, the two first votes voted for A. If A had voted for himself, he would have had the necessary majority; but, in accordance with his pledge, he voted for B. The vote of the remaining fellow was already secured for B, and B, with great presence of mind, instantly voted for himself. Poor A said that he had been jockeyed out of his vote on false pretences, and remonstrated in the newspapers and elsewhere; but the deed was done, and remonstrances were in vain. B enjoys the dignified position thus adroitly won, and is now a highly respected gentleman and leader of a religious party in the town of Cambridge. I must add, however, that some puritans in the university continue to give him a cold shoulder. This story, I need hardly say, is told by way of contrast to the election of Mr. Jowett. The fellows of Balliol enjoy and deserve the reputation of being the *élite* of Oxford in an intellectual point of view. Their election of Mr. Jowett was creditable to them, but merely satisfied the general desire of every liberal-minded man in Oxford. No man has worked harder, been more heartily respected, and better deserved his good fortune than the new Master of Balliol; and if his antecedents justify the anticipation, he will give more reality and importance to his position than it has ever possessed of late years. It is pleasant, also, to observe that, in spite of theological hatreds, even the Conservative papers, such as the *Standard*, express their satisfaction at the election—showing how much a man of such high character can do in the way of living down opposition. I may notice that of the six clergymen who wrote in "Essays and Reviews" two are dead, and three have now received distinguished appointments. Dr. Temple is a bishop, and Dr. Pattison, like Mr. Jowett, is head of a college. After all, these writers have not suffered very severely for their crimes.

PRUSSIAN SANITARY EXPERIENCE.

BERLIN, September 17, 1870.

IT will be of special interest to your readers to learn that the present war has largely profited by your good example in all matters appertaining to the nursing of the wounded and the organization of private benevolence. The noble women and men who in 1861 created your Sanitary Commission may justly be proud of their success and influence, which have extended across the ocean to the European battle-fields. Business-men and men of science avail themselves of the progress which in sanitary matters the world owes to you, and even crowned heads have found it in their interest to study republican improvements and to apply them in their armies. The other day, the Queen of Prussia publicly expressed her admiration for the advantages which the American Sanitary Commission had conferred on the whole civilized world, and proved to be well-informed about its history and doings. The several committees for the choice and distribution of provisions, medicines, and refreshments are often ruled by American precedents. Professors Virchow and Esmarch—two first-class medical authorities—in spite of the most vehement objections of red-tapists, have finally succeeded in introducing into the German field-hospitals the American system of barracks, which, with their good air and ventilation, are far superior to the damp, ill-ventilated, malodorous rooms of German hospitals. Professor Esmarch told me that previously, in the war of 1866, he had tried to introduce this barrack system, but that at that time he could not overcome the difficulties which were thrown in his way. The general objection to the proposed reform was that the German climate was much colder than the American, which is a mistake. On the contrary, here the climate is steadier, and the transitions from cold to hot weather, and *vice versa*, are not so sudden. At last Professor Esmarch has triumphed, and all parties concerned are pleased with the reform. I hope it will extend its influence among all classes of the people. You have no idea of the German fear and even terror of a cool draft, or of a well-ventilated room. Even in midsummer the windows are closed, and fresh air is anxiously excluded. The atmosphere in the majority of railroad cars and public rooms is as suffocating as in a sleeping-car on the worst American railroad—say Camden and Amboy. All these stupid prejudices will, I trust, die out, in consequence of the lately adopted American reform.

After the close of the war I will send you a full synopsis of what has been done for the wounded soldiers by private associations; let me now state the difference between the American and German systems. With you, it was the absolute want of official organs which called the Sanitary Commission into life. You had to create a most important branch of public service, for the reason that it did not exist, or that it was so badly provided for as to injure the health and the lives of the soldiers. You had to fill the gap which the want of experience and foresight on the part of the Government had left. While this state of things was neither normal nor regular, we had at the opening of hostilities hospitals, as well as experienced Government officers, surgeons, physicians, apothecaries, and stewards to attend to the wounded; but their number was only adapted for a comparatively small army, and not for 600,000 men, who had to take the field within a fortnight, and who had to act in large masses in a succession of battles. Private citizens could thus best prove their patriotism by assisting the Government in its duties and by making up deficiencies. While, consequently, with you private persons obtained a kind of official position, the Government here has tried to impose its existing official organs upon the volunteers offering their aid and contributions. In this direction, the Prussian authorities went so far as even to appoint a royal commissioner for the voluntary nursing of the sick. It is in keeping with Prussian official shabbiness, first, to profit from private donations and exertions, and, next, not to allow these voluntary contributors to dispose of their presents, time, and money at their own discretion. As people, however, do not resent this unbecoming treatment as an outrage against their intellect and patriotism, patriarchal governmentalism reigns supreme. The royal commissioner and his immediate assistants must of course be noblemen. The chief is a certain Prince of Pless, whose pedigree, I suppose, is very old, but whose acquirements and experience at the head of the physicians, nurses, and stewards appear to be rather limited. His assistants are the Knights of St. John, a mediæval caricature, a resuscitated reminiscence of the Crusades. These so-called knights wear the fancy-dress-ball costume of a rich scarlet uniform with a white cross on the arm, and a white mantle with a red cross, big top-boots, and a heavy sword. Here a long line of ancestors is not so requisite as a heavy portemonnaie. Practical and experienced men, physicians, and surgeons are expected to report and submit their better judgment to gentlemen who may have the best intentions, but wholly lack capacity to do their work well. Wherever the Knights of St. John are, there is confusion, complaint, and disorder. Instead of conducting the medical department as their duty requires them to do, they prefer making a great noise, strolling through the streets, monopolizing public conveyances, drinking claret and champagne, and interfering where they are least wanted. The people call them the bottle bummers. Thus the most important places of private benevolence are filled by persons who have not the least qualification for their position. It was just the secret of the success of your Sanitary Commission that the most public-spirited and best-prepared persons left private life for a time to devote their entire energies and knowledge to the public service. But as it is here, and as it will be everywhere in emergencies like the present one, humbug and charlatanry are quickly and mercilessly put aside by the real worth and devotion of noble minds. The thorough training of the working members of private associations has, in the short space of two months, overcome the artificial difficulties created by the mistaken policy of the Government. Practically, the Knights are no longer of any account; earnest men laugh at them; and the general contempt of this mediæval farce is so great that we shall have seen the last of it in this war. Thus the inefficiency and inability of the officials are no longer in the way of a sound administration of the sanitary department; the Knights no longer dare to interfere with private citizens who are intelligent and practically prepared for their calling. This progress has been dearly bought, and has cost us hundreds of valuable lives; but I trust that, for all future wars, it has secured to Germany the initiative of her thinking and working men in sanitary matters.

For the last fortnight we have had no stirring news from the seat of war, which has its explanation in the onward march of our troops to Paris. To-morrow, that city will be encircled by our armies, and the next week will decide whether they will have to besiege the French capital or whether the war will be ended in a short time. Paris cannot hold out longer than three months;—that is the longest time our military men allow the doomed city. Our soldiers, of course, want to get home as soon as possible. After the surrender of Sedan, they were enthusiastic in the belief that with Napoleon's capture the war was over, and that they would at once march back to Germany. Their disappointment was great when they were told that they had first to make a military excursion to Paris, to settle our bills there. The King of Prussia will return to Berlin next week. The old gentleman has done his part of the work heroically. At his age, he does not wish again to enter triumphantly into Paris, which he first saw as a youth of eighteen when old Blücher took the city from the south. Now the Crown Prince and his generals can finish the campaign. I do not believe that King William is influenced by the apprehension of being shot by a Frenchman at his entry, but prudent men here think it better that he should not unnecessarily expose himself to danger.

The weather here, as well as in France, is horrid beyond description; it is as if we were in November or December. The state of health of our troops is comparatively good; fortunately, an epidemic has not yet made its appearance. The armies before Metz suffer most from moisture; the water stands, or at least stood, three to four feet high in the trenches, where they have partly to work and to rest.

The other day, September 9, a private festival took place here in honor of your minister. It was on that day fifty years that Mr. Bancroft had won his degree as Doctor of Philosophy at Göttingen. In 1820, there were very few Americans who visited German universities, and, except Mr. Bancroft, I know only Messrs. Everett and Calvert who finished their studies in Germany. At that time, it was a distinction in Germany to be an American; he was looked at with a sort of naïve curiosity, common people wondering that the transatlantic cousin was not black. Men of science received him on an equal footing with their most distinguished countrymen—Goethe, for instance, always admitted Americans whenever they applied for an interview—and all doors were hospitably opened to them. An American who, in 1820, passed his examination in classic Latin to win a degree, was quite a phenomenon. Since then, matters have greatly changed. It would be impossible to count the Americans now sojourning in Germany. It is common with all our universities to renew the diploma of their graduates at the expiration of fifty years. Göttingen, therefore, on the 9th, as a mark of special respect, had sent two of its professors, Wartz and Zachariae, to present the new diploma to Mr. Bancroft. The Berlin University, by its rector, Professor Dubois-Raymond, and the Academy by its secretary, Professor Haupt, addressed him in splendid speeches. The Queen had sent an oil portrait of Frederic the Great, accompanied by some handsome sentences, and almost all the prominent men of letters had come to pay their respects to the American scholar. I noticed among others the historians Ranke and Mommsen; members of the Academy, such as Pertz, Lepsius, besides Weierstrass and Grimm; and the jurists Gneist and Beseler. Mr. Bancroft had to answer three speeches; he delivered his in unexceptionable German, and in an excellent, noble spirit. The brotherhood of the long United States and of now united Germany in their common efforts for humanity and science, was the idea which pervaded his remarks and those of the others. The university would have given a dinner to Mr. Bancroft if it had not been prevented by the war from doing so.

FRIEDRICH KAPP.

Correspondence.

MILITARY EDUCATION.

TO THE EDITOR OF THE NATION:

SIR: I have read with the greatest interest all of your recent editorials on the Franco-German war, as well as the very valuable communications of your West Point contributor, "D. H. M." They have been to me full both of interest and of instruction. At the same time, I have seen neither in your columns nor anywhere else any reference to what seems to me the feature of this war most pregnant with future consequences—social, political, educational, and economical. This struggle marks the close of the old era of standing mercenary armies. The trained gladiators have gone hopelessly down before the organized militia. The test would seem to have been a crucial one. As "D. H. M." has shown us, the Prussian soldiery are nothing but a perfected militia. Their days of muster extend through three years; their liability to service over many years more. The militia system is, however, the basis; the regular army is but the militia in active service, scientifically officered. Not so the French army. That has, year by year, and more and more, tended to the gladiatorial element. The Zouaves, the Turcos, the Chasseurs d'Afrique, were made up of the material which twenty centuries ago peopled the arena. These were the *corps d'élite* of the French system. To this class—the savage refuse of civilization—the mercenary standing army was everywhere tending. It was at once the most expensive and the most politically dangerous army possible; with it fighting was a profession, not a duty; under the expense of sustaining it all Europe groaned. It came in with Louis XI.; it has gone out with Napoleon III.; for four centuries it has plundered and tyrannized over Europe.

What are we to hope from the system of organized militia destined to supplant it? Can we expect anything better? I am sanguine enough to hope great things from the change. It was my fortune to serve all through the late war, and to see, then and since, much of others who did the same. I have been led to think from this actual experience that, next to a college education, a generation of young men can go through no experience more beneficial than a couple of years of military service. It teaches them obedience and self-respect; it gives them self-reliance, and a taste of open-air life and physical development. I now speak, remember, of life in a strictly disciplined and thoroughly organized *popular* army, not of a life passed among brutal mercenaries. As a means of education alone, such an organization as the Prussian cannot but exercise an immense influence on the future of Europe. The schoolmaster must become a company-officer. It was Mr. Sumner, I think, who many years ago instituted a comparison between the annual cost of keeping up a sloop-of-war and of maintaining Harvard College. The college was proved to be unmistakably the less costly institution of the two. Already in Boston the sloop-of-war is converted into the "school-ship;" is made the college of the poor and depraved. My own personal experience tells me that an army might easily be made the great college of the poor, and the rough school of equality of both rich and poor. Army life is no more necessarily depraving than university life. The society of mercenaries and social refuse—unnecessary idleness and a brutal organization—have hitherto made it so; they need make it so no longer. Prussia has worked out the problem; in elevating her army morally and intellectually, she has made it invincible; the mercenary throughout Europe must now turn to honest labor or go to jail; the student and mechanic have thrashed him; Othello's occupation 's gone. Educationally, then, the armies of Europe, it may now be hoped, will prove the popular college of the future. They may cant about thus "throwing away two years of every man's life." Bah! Did I lose four of mine at the University? did I throw away yet other four in Virginia? I have sometimes feared since I was wasting more than four in making money.

So also, politically, the organized militia is an army of the people; it came from them, it returns to them; it sympathizes with them. It is no safe tool for the despot; it is no reliable support for Cæsarism. It will prove the best peace-society the world has yet invented. Wars are no longer the pleasant game of kings; they are the struggle of peoples. It is one thing to shout for war and sing the "Marseillaise," while you hound on the hired ruffian to go out and win or lose battles, of which you read in your newspaper; it is another and a very different thing to force war on, and then in the night to have the irresistible order come which takes you from occupation, from wife and child, to mobilize your regiment. The people will think twice before insisting on a repast of military glory which may, perchance, leave them food for worms. Those Prussian reserves cannot but be a great guarantee for peace except when, as now, the popular heart is stirred to its lowest depths.

For myself, I have seen enough—too much—of war. I hate it. I do not care for the combatants. They are men and take their chance, as I once took mine. My sympathy is, however, now deeply moved as I think of the poor peasantry of Alsace and Lorraine, of the helpless women and, more and most of all, of the poor little children; the thought recalls memories on which I do not like to dwell—memories of a dreary December, and of poor, houseless, pillaged women and little children in the Valley of the Shenandoah. It was war; it was necessary; but it was brutal. I want no more war; those who want to fight I would make fight themselves; if the people cry for war, the people—yes, every man of them, and no substitutes allowed—should go to war. If governments or kings drag them into wars, then they must suffer enough to make them teach governments and kings that they won't be dragged. Meanwhile, the present conflict is to me full of hope. Out of it the army may emerge, purified and exalted, into a great educational influence; no longer an engine of despotism, but a school in peace and a guarantee against war. Am I wholly oversanguine?

AN EX-COLONEL.

NEWPORT, R. I., September 25, 1870.

MAGAZINE LITERATURE.

TO THE EDITOR OF THE NATION:

SIR: In your very genial and complimentary notice of *Putnam's Magazine* in the *Nation* of September 22, you state that "it will shortly be merged in the transformed *Hours at Home*"—which statement is not warranted by any announcement of ours.

Whether *Putnam's Magazine* has or has not had a high rank among other periodicals, as the *Nation* questions, we think it is only just to ourselves and our friends to say that its circulation has always been larger than that of at least three of the "other periodicals" nearest the same character, and more than double that of a dozen of the English magazines of long-established reputation. This we are ready to show to any one interested.

The circulation of our magazine, for three years, has averaged more than 13,000; but even this sale has yielded better returns to the contributors (including those who "board round in the *Atlantic*," etc., as the *Nation* says) than it has to the publishers.

No one, perhaps, better appreciates the ability of the *Nation* than we do; and when this essential quality is united with integrity and candor and justice, to say nothing of magnanimity, the critic's vocation will be entitled to considerate respect.

THE PUBLISHERS OF "PUTNAM'S MAGAZINE."

TWENTY-THIRD STREET, September 27.

[In the notice complained of, we did not intend either to repeat or revise our opinion of *Putnam's Magazine*, as deliberately expressed from month to month for three years past, but simply to respond to a request that we should notice the approaching end of the magazine as an independent publication. We cannot see that we have in any way misrepresented the facts of the case. Whatever Messrs. Putnam & Sons may have announced, they were preceded by the announcement of Messrs. Charles Scribner & Co. that *Hours at Home* would be "enlarged, . . . improved, and its name changed to *Scribner's Monthly*;" and however the term "consolidation" may be preferred by Messrs. Putnam & Sons, it does not alter the fact that their magazine is practically "merged" in Messrs. Scribner's, which is "transformed" in name and, to some extent, in character, but which does not lose its continuity. For the rest, we must almost apologize for stating what is so evident as that "support" is measured not by circulation but by profits. Messrs. Putnam & Sons admit this when they say that "even this sale [of 13,000 copies] has yielded better returns to the contributors . . . than it has to the publishers." We supposed so. Had it been otherwise, the latter would hardly have sold out or consolidated.—ED. NATION.]

JOINT OWNERSHIP IN AMERICA.

TO THE EDITOR OF THE NATION:

SIR: In your remarks upon that portion of Maine's "Ancient Law" which treats of the origin of ownership, you say that Nasse "proves the existence of a village community (in England) in early times, lacking, it is true, the patriarchal elements, which it may be presumed to have outgrown." And again: "It would be worth while to examine how far the early settlers in this country were influenced by the traditions and surviving remnants of this system." To what extent the joint-ownership system prevailed among the English-speaking early settlers of this country I am unable to say, but the first settlements of the Spanish and French colonists in the Mississippi Valley were invariably formed upon the principle of joint-ownership of all the *realty* acquired by the colony. But their records afford the most convincing proof that they were influenced to do so through fear of the treacherous savages by whom they were surrounded, and not by "surviving remnants" of "patriarchal traditions which they had outgrown."

It may be asserted without fear of successful contradiction, that no instance of the joint-ownership principle can be given where the communists were not few in number and surrounded by comparative barbarians.

The history of the land titles of any of the old French settlements would be a complete illustration of the manner in which title in severalty (the natural aspiration of humanity) has always grown gradually out of the joint ownership originally established solely for purposes of mutual protection and convenience by communities isolated among a people of a lower order of civilization.

Now the historian of the Mississippi Valley, say 800 years hence, may "prove the existence of a village community in early times," but he will certainly be unwarranted in assuming it to have been the archaic institution or the outgrowth of patriarchal elements.

C. I. S.

ATCHISON, Sept. 26, 1870.

"THE RELIGION OF THE CHURCHES."

TO THE EDITOR OF THE NATION:

SIR: Three weeks ago I asked your attention (in a brief and courteous note) to a very serious charge in your paper of Sept. 1, p. 141, against "The Religion of the Churches," requesting the return of copy, if declined. Your entire suppression of the matter, both in and out of print, might naturally enough be taken as an admission that your statement was not defensible. But if so, it would seem to be due to very many of your readers, who are reasonably sensitive to such wholesale aspersions, to withdraw or modify the charge. Lest, in the pressure of editorial cares, you may have forgotten what this was, I will set it down again.

"Yet formal religion, the religion of the churches, takes no cognizance of this evil"—that "almost all the disorders of society arise about the domestic hearth and not far from the nuptial bed"—"except by general denunciation of adultery, prostitution, and abortion, for no one of which practices would it dare to put its professors to a searching test."

Are "the churches" to understand that they have no rights which the secular press that may choose to attack them is bound to respect? Even if this should be the case, they might be able to survive it; but a frank avowal of it would be manly.

JAY.

[We are sorry to say we have mislaid the letter to which the foregoing makes reference. It asked us, if we remember rightly, either to prove the charge which "Jay," who is a clergyman, quotes, or apologize for having made it. Having deliberately made up our minds not to do either, we declined to publish the letter. In selecting for publication letters which assail our position, we make a point, as well as the infirmities of human nature will allow, to select those which assail us most strongly and ably. Justice to our readers forces us, at the risk of appearing unfair, to suppress large numbers which have nothing to entitle them to notice but their dissatisfaction with things the *Nation* has said. "Jay's" letter we, perhaps erroneously, placed in this category. It belonged to a class which reaches us in considerable numbers, calling for proof of generalizations which are in their very nature incapable of proof, and which must derive all their value from the reputation for care and candor of the person who makes them, or from the extent to which they accord with the reader's own observation. For instance, if we say, "The French are a vivacious people," we are not at all unlikely to receive a demand that we shall prove it, from a writer who has known several Frenchmen of a taciturn and phlegmatic disposition. We are compelled in these cases to fall back on our character. We must do the same with regard to "Jay's" letter. We shall not attempt to prove what we have said, and shall not retract it. If he does not believe it, he has the luxury of disbelieving it always at his command.—ED. NATION.]

Notes.

LITERARY.

A POSITIVE want seems to have been supplied by Gen. Upton, author of our present system of infantry tactics, in a manual just issued by the Messrs. Appleton, called "Tactics for Non-military Bodies," and adapted to the instruction of political associations, police forces, fire organizations, masonic and other civic societies. As these tactics are closely assimilated to those in use in our service, the training they afford will not only conduce to public order on occasions of civic parades and processions, but will, as far as it goes, give to large numbers of men the character of militia. This is all the more desirable because it is certain that the absence of war and of all fears of war will soon tend to make a militia seem ridiculous, and militia training a foolish waste of time and money, as they did seem to us only ten years ago. These tactics would also have, we believe, a valuable influence upon school discipline, there being two things to recommend them, viz., that they may be practised without any expense for uniforms or arms, and without prejudice to the scruples of those who wish their aversion to all war to be shared by their children. Exercise of this sort may be viewed as an out-door gymnasium without apparatus, and whether performed in the field or in long excursions upon the roads would be always of advantage to health and *morale*. The mere marching to which the Prussians are accustomed in their summer campaigning has done as much as anything else to give them superiority in the present conflict.

—Dr. Nathan Allen, of Lowell, having got hold of an exceedingly good subject—the physical degeneracy of the native Americans—seems very loth to let it go. But if he will allow us to say so, each time that he brings it up, what he has to say about it seems less satisfactory. We have endeavored in vain to find in his contribution to the October number of the *Journal of Psychological Medicine* a reasonable pretext for publishing it. On the contrary, we have either been wearied with the repetition of general statements unaccompanied by precise statistics, and in fact admitted to be incapable, as yet, of convincing proof; or annoyed by assumptions which a professional man should not have been guilty of. For instance, Dr. Allen says that "no one truth in vital statistics is better established than the fact that *city life* tends to reduce the physical energies of the body and shorten human life;" and that "the increasing migration of our people from the country to the city is decidedly unfavorable to physical stamina and life." We believe that neither position is tenable. The first is discredited by the frequent superiority of the city over the country in its health and mortality rates; and the sanitary statistics of our armies disprove the latter, by showing that in point of endurance the soldier from the farm was inferior to his comrade from the counting-room. Again, wishing to establish the greater robustness of our ancestors, he says "they required a great amount of venesection, and the use of powerful drugs, neither of which with us is often required or very well borne." It is something to the point that they did not die under this treatment, but the disuse of blood-letting is commonly and more naturally attributed to the same cause as the disuse of mercury—improvement in medical science, and not to a change in the constitution of successive generations. And is this a medical axiom, "that all imperfect developments, marked weaknesses, or strong predispositions to disease, are transmitted in an *intensified* form?" Dr. Allen denounces the prevailing modes of dress among women as contributing largely to their decline and weakness of organization. We believe that in every respect, from corsets to shoes, women are now more wholesomely clad than at any time since the settlement of this country, and that something else besides costume must be charged with causing the extraordinary consumption of iron tonics by women, alleged by this writer.

—Dr. Allen bases some important conclusions on the census of 1860. No objection can be made to his using this authority, but we may improve the occasion to express our hearty satisfaction that we shall soon be released from the necessity of trusting solely or much to so imperfect a body of statistics. The present superintendent of the Census Bureau has made numerous searching tests of the consistency of the last census with itself, and has seldom, if ever, found the agreement which would have resulted from faithful and accurate calculations. In organizing his present force of clerks, as they formed a new bureau, he had no difficulty in applying the competitive system which the Secretary of the Interior had instituted for his department. He has in consequence, probably, the best set of assistants employed in Washington, and is able to promise not only far greater accuracy than has ever been reached before, but that the summaries which he means to have ready by the meeting of Congress will be completed portions of the main work, the rest of which may be done more at leisure. For this unprecedented despatch we must make our acknowledgments to the civil service reform.

—So long as our civil service remains what it is, we are not, for our own part, anxious to see the telegraphs undertaken by the Government in connection with the post-office. Nevertheless, we have sometimes had occasion to wish that such a connection existed, for other reasons than that of rates. We will instance three cases, and doubtless more might be imagined. First, suppose it desirable to telegraph a person who is temporarily staying in Chicago or New Orleans, whose lodgings are unknown, but who probably or certainly calls for his letters at the general delivery of the post-office. Except through the post-office there is evidently no way of reaching him; and yet there is now no provision by which your telegram, after it arrives at its destination, can be put into an envelope, properly addressed, and dropped into the post-office. Again, there are hundreds of places, in out-of-the-way districts, which have no telegraphic communication with the rest of the world, but which could often be reached in time if the telegram, after being received at the nearest station, were thence carried forward by post. Lastly, take a town like Cambridge, Mass., the seat of a university, and containing at least 600 students from all parts of the country, and yet only connected with Boston by private wires. The charge for an ordinary telegram to Boston is thirty cents, to Cambridge at least fifty-five and by one line eighty, with no certainty of getting a reply. A message from this city which would answer its purpose if delivered any time in the course of the same day in Cambridge, might well be spared an excessive tax by being allowed, say for five cents additional, to be deposited in the Boston post-office, to go out with the first mail to Cambridge. In general, it may be said, we ought to be able to give any telegram both the start of the mail at the place of sending, and the benefit of the mail at any distributing office on the way to its destination. Nothing would be easier for the telegraph companies, under present arrangements, than to afford this accommodation to the public.

—In England, where consolidation has actually taken place, if a telegram is to be sent to a person not living in the limits of free delivery, the sender may, to avoid expense of special delivery, request to have it forwarded by the regular local post. Messages of this sort, say the Post-office rules, "may not only be tendered for transmission at postal-telegraph offices, but may be enclosed in envelopes addressed 'Telegraph Office,' and deposited in wall or pillar-boxes, or in the letter-boxes of ordinary receiving offices or sub post-offices. Telegrams so deposited will be sent on to the nearest postal-telegraph office by the first ordinary postal collection from the letter-box in which they are deposited, and will be sent on by wire from that nearest postal-telegraph office as soon as possible after they reach it, and will be delivered to the address free of extra charge, provided the proper charges for the number of words contained in them, and for porterage when they have to be delivered beyond the limits of the free delivery, have been prepaid by means of postage-stamps affixed to the message-forms." On the Continent, a telegram sent at random with an imperfect address stands the same chance of being delivered as a letter sent in the same way; and it is notorious that no pains are spared, and that extraordinary sagacity is exercised, to discover the rightful recipient. In a case that recently came to our knowledge, a telegram sent to a watering-place without particulars besides the name, was not deliverable after the most thorough search, though the person it was designed for happened to be in the place; but when he came to the post-office, on leaving, to give directions for his letters to follow him, he was recognized and the telegram handed him.

—In order to understand exactly how "insolent" the Prussian demands for possession of French territory are, it is necessary to recall not only the purpose of France in declaring the war, but the national aim for forty years to rectify the frontier—that is, in cool blood to annex all the countries and peoples lying between north-eastern France and the Rhine. But even this does not represent the programme in full. Théophile Lavallée has left in his "Physical, Historical, and Military Geography"—a work first published in 1836, and now translated and edited by the author's pupil, Captain Lendy—an account of what, following his other divisions of Europe on a primarily physical basis, he calls the "French Region." This region, according to him, if due regard were had to mountain systems and watersheds, would embrace, besides France itself, (1) Belgium, (2) the southern part of Holland, (3) the Prussian and Bavarian Provinces on the west bank of the Rhine, (4) part of Hesse-Darmstadt, (5) the Helvetic Republic. Lest this be thought the idle dream of an enthusiast, it is necessary to state that a treatise of Lavallée's on the frontiers of France, in which these ideas were powerfully set forth and their application advocated, was crowned by the Academy. Comparing such pretensions and such a purpose, in time of peace, with Prussia's most grasping terms of release for its fairly conquered assailant and would-be despoiler—terms, too, dictated simply by a desire to make another disturbance of German quiet impossible—to call the latter "insolent" requires, it must be confessed, an uncommon degree of effrontery. Lavallée's analysis, however, of the several French frontiers is well worth studying, even though the war has passed the stage in which a knowledge of the general configuration of France is likely to throw light on the progress of hostilities. He examines in detail the northern watershed of the Pyrenees, the watershed of the Bay of Biscay, of the English Channel, of the Mediterranean, and of the German Ocean—the last having most to do, of course, with the present war.

—The real delusion which France has cherished has been not so much in regard to her physical as to her moral frontiers. The thing which it now goes hardest with her to resign, but which Prussia is bent on wresting from her so far as Germany is concerned, is the ability to intermeddle at pleasure with the affairs of other nations—to maintain French influence with its centre at Paris and its circumference anywhere that it suits the temper or the interest of the French to extend it. France has arrogated to herself the propagation of all liberal ideas, the primacy in the world's advance. In the words of Lavallée, in the work just referred to, she seems "to have been for fifteen centuries providentially charged with the mission of progress. . . . France, the heart of the world. . . . . Movement and life issue forth from her; the various modes of civilization of other peoples are united in her; agricultural and commercial, warlike by land and by sea, artistic and scientific, she is not exclusive or special, but universal like her language." No one has more completely adopted this idea than Guizot, notably in his "History of Civilization in Europe," where he uses, indeed, almost the same phraseology. At the present juncture he, no more than Thiers or Laboulaye, is frank enough to admit that France has ceased to lead Europe in thought, in diplomacy, and in arms, and that it is for her an act of repentance as well as of necessity to put up with a second rank. As historians, recording accomplished facts, their reluctance to acknowledge the true state of the case would be pardonable; but as public leaders their part is a weak one. Guizot, by the way, it is known has consented to publish a history of France from the earliest times to the year 1789, composed originally for the younger members of his own family, and for them only. It has been translated into English by Mr. Robert Black, and Messrs. Sampson Low & Co. are now issuing it in twenty-four parts, to be illustrated with a hundred full-page and many smaller engravings. It can hardly fail to be popular.

—There are few periodicals whose regular appearance gives us so much pleasure as that of the *Revue des Deux Mondes;* and among the pleasantest reading in each number we have been accustomed to reckon Charles de Mazade's light and sprightly talk in its political "Chronique" of the fortnight. We have enjoyed this the more inasmuch as M. de Mazade unites, with the volubility, grace, and elegance so frequently met with in French political writers of the better class, the rarer merits of accurate information and unprejudiced judgment. No French mind, however, seems to have been sufficiently poised to observe and endure with philosophic calmness the events of the month of August; and, after making all due allowance for their effect on M. de Mazade, we are sorry to say that we find the last "Chronique" that has reached us (Sept. 1) worthier of the *Figaro* or of the *Rappel* than of the *Revue des Deux Mondes.* Dated the day before the surrender of Sedan, it not only mocks at the bulletins of King William as announcing triumphs which "the evident, palpable result" shows to mean little more than a useless and frightful waste of Prussian blood; it not only represents the condition of affairs as wonderfully improved for France since the surprises of Wörth and Saarbrück, but it also sneeringly contrasts the German movements with those of Bazaine and McMahon. "That army which boasts of being fully triumphant, of having broken the nerve of the French forces in three great battles, has made no new attempt since the 18th; it has no thought of profiting by its victory; it is reduced to immobility. If it has been so fortunate in its operations, why does it not push its success? The truth is that, without issuing bulletins, Marshal Bazaine, on his part, has done what he wanted." And in reference to this commander it exclaims: "A marshal of France at the head of 100,000 men to capitulate ever!" Bazaine, let us admit, has not disappointed this assumption, which, nevertheless, the very next day made ridiculous. But all this fades before the extraordinary assertion: "Certainly, if there be a notorious fact, it is that France, in entering on the struggle, had no idea but to wage a purely political war (*guerre toute politique*), entertained no hatred toward Germany, cherished no thought of devastation and depredation." But what about the mitrailleuses, and the Turcos? And would it really be a consolation to a German widow to know that her husband had been slain "politically" only, while personally the French wished him well?

—Two other articles of the last *Revue des Deux Mondes* have reference to the prevailing hostilities—one, by Paul Leroy-Beaulieu, on "The Resources of France and of Prussia in the War;" and the other, by Xavier Raymond, on "The Fortifications of Paris and the Means of its Defence." Both are instructive reading, though naturally enough falling short of the usual standard of the *Revue.* French national vanity, or the design to flatter that foible, pervades both no less than patriotic confidence in the powers and defences of the country; but the first-mentioned concludes with some wholesome and fairly candid admissions. "It would be hard to find in all Europe," says M. Leroy-Beaulieu, "institutions so immovable and officials so inert. Our bureaux . . . . knowing nothing of foreign peoples, are incapable of availing themselves of the progress making around us; with a blindness allied to obstinacy they flatter themselves that all our customs and usages are an object of admiration and envy to the rest of Europe. It was time for us to be roused by a violent shock from this slumber. . . . . Hitherto we have lived ignorant, careless, disdainful of the languages, manners, and institutions of foreign countries. We knew neither our neighbors' strength nor resources, and they knew everything that was going on with us, appropriated all our discoveries, all our progress. . . . . Thus are explained all our errors, whether diplomatic or military; nor must they be exclusively imputed to the want of thoroughness or negligence of a few men. They proceed from a more general cause—from that species of intellectual isolation in which we have ended by shutting ourselves up. *The ignorance of the entire nation can alone bring about such deceptions.*" And here is more good sense: "In fact, a social *milieu* of peculiar fecundity and cultivation is required to produce the sum of faculties and acquirements necessary for the composition of a good modern army. We have relied with too much confidence on our native qualities; we have had too little regard for that intellectual preparation, for that theoretic development, for that scientific side of war, to which our enemies of to-day have given so much consideration. With us general instruction has neither sufficient extension nor sufficient depth. . . . . A few more millions inscribed in the budget of public instruction would increase in a great measure not only the peaceful development but also the military resources of our nation. . . . . There are two maxims serving to guide our conduct which we ought never to lose sight of: first, that the greatest scourge of a people is optimism; second, that, even in war, the principal strength of a nation consists in its moral and intellectual forces."

THE PASSION PLAY.*

THE general interest in the Ammergau "Passionspiel" has been very great this year. Its attractions have been made so well known by European tourists, and touring is now carried on upon a scale so much larger than ever before, that unexampled audiences were gathered to witness the spectacle, and the letters written in description of it would make a good-sized volume. Doubtless there would have been greater crowds and more letters had not the coming of the war forbidden the continuance of the performance. With a touch of "the irony of fate and circumstance," the chief actor in the play, Joseph Mair, the personator of the Saviour—who came into the world, Mair may have bethought himself, not to bring peace but a sword—was called away two months ago to take his place in the Bavarian army, and has been killing or been killed in Alsace and Lorraine. The correspondents, however, were early on the spot, and their letters have been very full and excellent. Perhaps as good as any for their expression of the feelings which the play excites in the case of a reverent and religiously-minded person have been those of a lady who wrote in the *Spectator.* Very good were those of a lady who wrote in the *Pall Mall Gazette,* and who had the advantage of being accompanied to the theatre by the Baroness Tautphœus, who was, we think, the first writer to make the play known in England and America. Her novel called "Quits" has for one of the chapters of one of the pleasantest love stories ever written by an Englishwoman a very good description of the Ammergau festival. Of these two correspondents the latter is, perhaps, the better, as giving us an account more circumstantial than the other, and less subjective. The mere facts, if at all well set forth, are of themselves enough to impress the reader strongly, and to indispose him for listening to any account of how a spectator was affected. Still better, and better for the same reason, are the letters written to the London *Times* by the Rev. Malcolm MacColl and republished in the little volume before us.

Mr. MacColl's book opens with a few pages of introductory matter containing some easily accessible general information, not, however, unwelcome to most readers, about the theatre of the ancients and that of the Middle Ages, and about this Ammergau Passion Play in particular. In 1633, it appears, the neighborhood of the valley of the river Ammer, in Southern Bavaria, was devastated by an epidemic disease which had been exceedingly destructive, and which the Ammerthalers took every precaution to keep out of their valley. Their quarantine was, however, evaded; an infected peasant brought in the disease, and the valley speedily lost a great part of its inhabitants. In their extremity, the people made a public vow that if they should be spared they would, once in every ten years, "for thankful remembrance and edifying contemplation, and by the help of the Almighty, represent the sufferings of Jesus, the Saviour of the world." This vow having been made, the plague ceased forthwith, if local tradition may be believed, nobody afterwards dying, although many were at the time sick; and in the following year the first fulfilment of the vow was made by the citizens of Ober-Ammergau. Ever since, every ten years, the play has been exhibited without intermission, although on three occasions—in 1780, 1790, and 1810—there has been danger that the royal permission to enact it would be refused. It has undergone many revisions, and apparently has always been improved by the alterations; the materialism and grossness of the earlier drafts having been to a great extent purged away, although a Protestant not, like the Tyrolese, accustomed to see everywhere, by the roadside, in the churches, in the houses, the pictured figure of the Christ on the Cross, might very probably still feel something of the revolt apprehended by the Baroness Tautphœus when she first was present at the spectacle. So realistic used the representations to be at some of these Passion plays that not only would they be disgusting to modern taste, but serious accidents arising from the zeal and earnestness of the performers were not infrequent. It is related that one priest who acted Judas in a Passion play exhibited at Metz, in 1437, all but succeeded in hanging himself; another who acted the part of the Saviour nearly died on the cross and had to be taken down; it was customary for the man who acted Judas to secrete a blackbird about him, which, at the moment of the traitor's suicide, was let loose, and, flying away, represented the polluted soul of the traitor on its way to perdition; sometimes a dummy was hanged instead of Judas, and, being caused to fall down from the tree, burst open as in the Scriptural account; and sometimes the dummy was let drop through a flaming aperture which served as the mouth of hell. It would be easy to multiply much more revolting instances than these, as every reader of the history of the European drama knows. In the Passion play now acted at Ammergau there is nothing of this crudity of conception and coarse vulgarity. The hell of the sinner, for instance, is there a fire within him, not a flame of fagots and tar-barrels; Cain and Judas, says Mr. MacColl, "flee from the haunts of men, and the latter 'flings from him in wild haste the intolerable burden of life.' But in vain. From the faces of his fellow-men and the scenes of his crime—from these he may escape, but he cannot escape from himself, and is therefore in hell wherever his local habitation may be." This emancipation of the play from the influence of mediæval theology and brutality is due to the lateness of the last recension, which was made between the rendition of 1840 and that of 1850. We may add that the music for the chorus—which the villagers will not publish, and of which they will suffer no one to take notes—is in great part no older than the date of the early part of the present century.

---

* "The Ammergau Passion Play. Reprinted by permission from the *Times.* By Rev. Malcolm MacColl, D.D." London, Oxford, and Cambridge: Rivingtons. 1870.

Of the open-air theatre, the chorus, and the general manner of putting the play upon the stage, we have spoken on another occasion. We will add a little of the information which may be found *in extenso* in Mr. MacColl's letters, only reminding the reader that the play occupies the better part of a day in the representation, and that it consists, first, of scenes in the last day or two of Christ's life; secondly, of *tableaux vivants* presenting Old Testament occurrences believed to foreshadow events recorded in the New; and, thirdly, of singing by a chorus, who explain the tableaux. In the first tableau, Adam and Eve are driven out of Paradise by an angel who brandishes a flaming sword. In the second is a group of children clustered before a cross, which is clasped by a kneeling figure. The chorus, kneeling, sing a prayer, the words of which are these: "Eternal One! hear Thy children's stammering prayer (for a child can only stammer), who with holy awe assemble to worship before the great sacrifice." Then the audience are addressed, and told to "follow by the side of our great Redeemer until He has passed through His rough and stormy way, and through His hot and bloody agony has gained for us the victory." Next comes the entrance of Christ into Jerusalem, the strewing of palm branches before him, and the driving of the mammon-worshippers out of the temple. The succeeding tableau shows Joseph's brethren plotting his death, and this is followed by the scene of the high-priests and Pharisees consulting how Jesus shall be got into their power. Then Tobias bidding farewell to his parents, and the forlorn bride in Solomon's Song asking after her Beloved, typify Christ taking leave of his mother in Bethany, where Mary anoints him and Judas murmurs at the waste. In the fourth representation Ahasuerus puts away Vashti and exalts Esther, and the chorus explains that Vashti's conduct is typical of the rejection of the Gospel by the Jews, who obstinately refused the summons to the royal feast, and that Esther's elevation signifies the call of the despised Gentiles. This is followed by Christ's lament for the fate of Jerusalem which rejects him, and the refrain "Jerusalem, Jerusalem," of the beautiful song which introduces the lament, is described as being very impressive, as also is the scenery depicting the city in the soft and melancholy sunset light. We have not space to go through the long list of scenes and tableaux, which cover a great portion of Biblical history, but will mention one or two more. The curtain, having dropped on the scene in which Judas is tempted by certain Pharisees to betray his master, rises upon a tableau which shows to the spectator the Israelites gathering manna in the wilderness, and this is followed by another in which appear two men in the midst of a crowd bearing upon their shoulders a pole from which hang clusters of grapes of Eshcol. In front and to the right and left of this assemblage of almost three hundred figures, clothed in oriental dresses, stand the chorus in their white tunics and purple or red or blue mantles, singing verses which explain that the bread from heaven and the grapes from the Promised Land typify the mystical bread and wine of the sacrament. In the crucifixion scene, our correspondent could not discover, he says, though he closely examined Mair through an opera-glass, how it was that he was fastened to the cross. He seemed to be nailed there. That, of course, could not be; but it was plain that great muscular exertion must have been required on his part, because after he was taken down—he had hung there seventeen minutes—the limbs of the cross could be seen to be damp with his perspiration. Probably his nervous excitement and exhaustion had as much to do with this as his physical effort, for all the accounts agree that Mair threw himself into his part with great intensity.

They all agree, too, that he acted it with a dignity and power so great that he not only gave no shock to the spectators' sense of religious propriety, but even sent them away with religious feelings of increased reverence as well as vividness. Readers who may turn to "Quits" to refresh their memories of the play will, perhaps, be interested to hear that the Herr Pflunger, who took the part of Christ in 1850, when the Baroness Tautphœus saw the representation of which she speaks in that novel, now takes the part of Pontius Pilate, and plays it with great applause. It is worth mentioning, too, as illustrating the general carefulness with which the play is put upon the stage, and the peasant actors are trained, that, although it is now nearly two hundred and fifty years since the performances began, none of the other performers know how the Christ is fastened to the cross. It appears that the whole population of the village—men, women, and children—devote most of their thoughts to the fitting themselves for taking their parts in this unique observance. It is said, and may readily be believed, that its influence upon their minds and conduct is marked, and is markedly for good, as the people of Ober-Ammergau are noted for their honesty, intelligence, and religious earnestness. The play is, in short, a rustic university, so to speak, and gives to its performers a sort of liberal education. It is a university, too, which differs from most others in paying its expenses. In 1860, the number of visitors was sixty thousand, and the money taken for tickets of admission and *libretti* was fifty-four thousand florins, of which a part is devoted to charitable purposes, and a part constitutes a fund out of which the dresses and appointments are paid for. Mr. MacColl's letters, we may add, if any one is looking forward so far as to a visit to Europe in 1880, contains minute directions as to the intending visitors' routes of travel, and selection and securing of rooms.

John: A Love Story. By Mrs. Oliphant, author of "The Laird of Norlaw," "Katie Stewart," "Brownlows," etc. (New York: Harper & Bros. 1870.)—To people who remember "Madonna Mary," or that charming story, "Katie Stewart," "John" will seem a slight and marrowless production; but to those blessed with shorter memories or less experience, Mrs. Oliphant's delicate sympathies, nice observation, and refined manner will still suffice to make her books pleasant reading. It is with herself only that we are measuring her, when we find that her work betrays a sad falling off. She is paying the penalty paid by every one who forces production in literature—the penalty of inevitable deterioration and repetition. There was a time when she drew her figures so well that they had a real vitality, and it was possible in following their fortunes to forget their author; and even last year her "Minister's Wife," although it was much too long, had some vigorous and subtle work in it. But the characters of the present story are altogether too thin and unsubstantial, from John himself, with his lumbering stupidity and his undefined doubts about the Athanasian Creed, to Kate, who, with her pink cheeks and sapphire eyes and dainty clothes, is but the veriest of lay-figures, and one which repays but ill the pains Mrs. Oliphant has wasted on her outfit. And since it was always on the personages of her stories that the interest of Mrs. Oliphant's books depended—on how they felt, and thought, and spoke, and moved, and not at all, or but slightly, on the plots or incidents in which they were concerned, there is not much left of the old charm in this novel, except only the easy and graceful refinement of her manner of narration. That seems nearly as agreeable as ever; or it would seem so if it were not that even in a novel what is done is of so much more consequence than how it is done, that when the matter is so slight as it is in this case the manner becomes of little importance.

Fine Arts.

MARIE SEEBACH.

For decades, almost for centuries, the critics have been at war as to the test or the definition of greatness in acting. The real and the ideal, the classic and the romantic, with numberless other schools or subdivisions of schools, have had their expounders and their representatives. It will be enough for our present purpose to assume that when cultivated people, of good sense and good taste, are deeply and, so to speak, *normally* moved and impressed by any given actor or actress, that artist has a fair right to be called great. Such an one is Marie Seebach.

Her power is in no sense dependent on any external charm of mere personal grace or prettiness; she could not, in any but a spiritual sense, be called beautiful. It is a somewhat mortifying self-examination, which most of us have at some time or other to undergo, when, on analyzing the elements of the fascination exercised by actress or prima donna, we are forced to recognize how large a part of our admiration has been given—how much of our pleasure due—to mere beauty of form and color. Put it as we will, we are still prone to forgive a weakness in the cadenza or a fault in the declamation to the rosy mouth which utters the one, or the white and shapely arm which emphasizes the other. Marie Seebach can lay claim to no such advantages. She is tall, thin, and of a figure neither rounded nor, in the everyday sense, graceful. Her face is aquiline, strongly marked, and worn with the cares of real life as well as the emotions of nearly twenty years of an artist's toil. The eyes are not bright with youth and exuberant vitality, nor calm and full with the rich depth so often seen in women whose lives are just touching the midsummer point of a placid or a luxurious existence; they are somewhat wan, somewhat hollow, as of one whose nature had suffered the reaction of her career, who had felt deeply and vividly the passion or the sorrow another would only have feigned. Let us be excused, then, before the high court of chivalry, if we say once more, plainly, that not even by the kindest construction could Mme. Seebach be called a beautiful or even a comely woman, as the world looks at such things. But what the woman has lost, the artist has gained. The eyes, if they do not sparkle, can deepen, and dilate, and flame; the figure, too spare and angular for the white muslin of the *ingenue*, is commanding and majestic in the mantle of the queen; the features have exchanged their girlish contour and softness for a startling power and depth of expression; and the voice—

> "All ravage leaves that whole."

Her voice is an organ of wonderful power and flexibility—now soft and mellow, now deep and ringing, but always rich, penetrating, and sympathetic.

Though we began by disclaiming any intention to fight over again the battle of the realistic and ideal schools, the distinction cannot be altogether overlooked. A main excellence—perhaps the prominent one—in Mme. Seebach's acting is her careful, minute, and profound realism, more especially in all passages where the gentler or more tender emotions are portrayed. In all such passages, her acting—in actual reading, in gesture and facial expression, and in her by-play when not engaged in the dialogue—all show the conscientious and loving study of many years, while the spectator is impressed, at the same time, with the conviction that every word, every intonation, comes from the heart; that she is, for the moment, in thought and feeling, the loving *Margaret*, or the patient, suffering, blind girl of the piece. It has been objected to her delineation of *Gretchen* that she does not look the part, and, again, that her acting shows study, and is too consciously and distinctly intellectual. But the first stricture might be answered with the witty apothegm of the French critic, that to play the *ingenue* in perfection, an actress must be well past the age of *ingenuité*. To the second, which demands more careful consideration, we might reply by reminding the objector how completely even the best acting is and always must be a matter of technicality and, as it were, of machinery. Sublimate it as we may by the most delicate taste, inform it with the loftiest imagination, the machinery is still there. Its object is to reach not merely one or two spectators, near in position, with the keenest attention, and finest sensibility; it aims at a large and varied auditory, scattered over a vast hall, of differing degrees of taste and culture, but never, in the average, very ready in perception of the subtler shades of expression, and needing absolutely a somewhat artificial medium of transmission which the trained critic, watchful and alive, seated with his opera-glass under the very blaze of the foot-lights, might perhaps dispense with. In Grecian days, the actor, we know, was forced to tread the stage in the stilted cothurnus, and declaim through a bell-mouthed mask, to bring the mere physical effect of his acting into relation with the vast profound of the theatre and the audience. Though we are happily past all that, yet, as long as theatres and audiences are constituted as at present, so long, probably, will the actor be forced to a sort of discreet exaggeration; he must in some degree deepen the lines and heighten the tints of his picture, like the painter who examines the rough hatching and bold *impasto* of his brush from the furthest corner of his studio, to suit the light and the focal rang in which it will be scanned by the public. Nor let us be understood as admitting for a moment that Mme. Seebach's acting has any traits of coarse or extravagant expression. We have known no acting, except, perhaps, in the case of one or two of the great artists of the Rue Richelieu, so full of delicate, almost imperceptible shades and intonations; she is never at fault, never off her guard. Among the hundreds of instances of this that might be adduced even from the few nights of her engagement already elapsed, it is only necessary to allude to such effects—only to be properly appreciated by the critic aforesaid in the front row—as the slight start and haughty dilatation of the eye at *Burleigh's* assumption in the first act of "Maria Stuart," and the little peevish, impatient tones which once or twice escape her in the scene with *Caroline* in "Valerie." The shivering spasm of pain with which she turns to her nurse in the parting scene of "Maria Stuart" must needs have come from a nature which has known sharp suffering; but the low thrilling whisper of ecstasy, of that bliss which turns the heart sick with its own excess—the two murmured words, "mich überläuft's!" in the love scene with *Faust*—were at once the most intense and the most effective realism. Where the emergency of the scene demands it and the richness and energy of her nature find fullest sway, this ever-watchful taste and subtle discrimination are still at hand. The burst of thankfulness at recovered sight in "Valerie" might easily have been—with a second-rate actress would certainly have been—absurd; with Mme. Seebach it was superb. In the prison scene of "Faust," every one will remember the scream of anguish with which she searches in the straw for her child. A hair's-breadth less would have been weak; a hair's-breadth more, horrible or ludicrous. As it was, we venture to say that, at that agonizing cry, every mother in the audience realized the significance of the old phrase, "freezing the marrow of one's bones." And finally, in the terrible climax of *Maria's* interview with *Elizabeth*, the culmination of Mme. Seebach's interpretations, where the abyss of rant yawned almost inevitable before her, could anything be more pregnant with artistic measure and symmetry, in the very seething of its lava-torrent, than the bitter scorn and scathing indignation of her defiance?

The spectator who comes away—as who does not?—filled and satisfied with the perfection of *ensemble* in Mme. Seebach's delineations, might almost be forgiven for failing to lay sufficient stress on some subsidiary but indispensable elements of the picture—the wonderful truth and accuracy of her reading, and her exquisite delicacy of intonation and distinctness of delivery. When other actors are hurried and indistinct, her slightest sigh or faintest whisper finds its way to the ears—and the hearts—of her auditors. Nor would it be easy to say too much of the singularly sympathetic quality—the pathetic thrill—of her voice where pathos is wanted. It is in general a pretty easy thing to make an average audience cry. The mere physical manifestation of sorrow on the stage, however coarsely or patently given, is usually enough to excite a response from the more nervous or the more superficial temperaments in the boxes. The well known "*Si vis me flere, primum est dolendum tibi*" of Horace is as true now as ever. But Mme. Seebach's power over the feelings goes wider and deeper than this. When the old stagers—the case-hardened playgoers and sceptical critics, who know, or think they know, the whole gamut of ordinary theatrical emotion, and look with suspicion on any new attempt to stir their cynical composure—when such as these are forced to have recourse to the patent opera-glass or still more patent handkerchief, to hide the tell-tale twitching of the mouth and suffusion of the eyes, especially, too, in situations where the less observant public sits unmoved, we feel that the artist has found the key to our hearts—that we are in the presence of a great actress.

That this accomplished artist should be thoroughly enjoyed and appreciated in New York would be too much to hope. Of the three hundred thousand Germans who, by Mr. Kapp's estimates, inhabit the city and suburbs, far too small a percentage are, in view of their employment, means, or taste, in condition to take advantage of this exceptional glimpse into the higher art-world. Of our own native population, but the very smallest proportion, even among the most cultivated classes, have the familiar knowledge of the spoken language which would make them free of that weariness and snare, the libretto, and enable them, from the passive point of view, to fit "the action to the word, the word to the action." It is one of the highest triumphs Mme. Seebach has won here, that hundreds of people, in every class, whose studies in the tongue of Goethe and Schiller have never gone beyond the one mystic word *lager*, come away from the Fourteenth-Street Theatre, night after night, delighted and entranced—ready to take solemn oath that they "understood every word of it." As a secondary result of her appearance here, it could not but please Mme. Seebach to know that the reflex action of this her great success cannot fail to be an increased earnestness in the study of the noble literature which she so brilliantly illustrates.

The Nation.

NEW YORK, THURSDAY, OCTOBER 13, 1870.

The Week.

THE latest news from Paris has reached the outer world in a most extraordinary way. A member of the Government of National Defence, M. Gambetta, was the bearer of it. He left Paris in a balloon on the 7th, and after a very dangerous flight above the Prussian guns, came down north of Montdidier, proceeded thence to Amiens, and finally reached Tours, where, besides continuing his office as Minister of the Interior, he also relieves Crémieux of his temporary duties as Minister of War. M. Gambetta brings, as he expresses it, "the hopes of the Parisians"—hopes founded on "400,000 National Guards, 100,000 Mobiles, and 60,000 regulars," for whom "the founderies are casting cannon" and "the women make a million cartridges daily," and on the "forts manned by marines, supplied with artillery of the greatest excellence, and served by gunners the first in the world," and on the fortified *enceinte*, with its "3,800" pieces of cannon. These grounds for hope, even after making the necessary allowances for patriotic amplification, we should consider plausible enough; but, unfortunately, M. Gambetta finds it necessary to mention an additional ground, "the third line of defence—the barricades, which are adapted to the genius of the Parisians." We suspect this genius knows too little of military affairs, though guided by the chief director of "the third line of defence," Rochefort, and rather overestimates the value of barricades as a shelter against the heavy bombs of the "Attila of the Nineteenth Century"—as Louis Blanc calls King William, in an address expressive of everything but confidence. Neither is there much reason for confidence, while Paris eats horse-flesh, its besiegers are erecting batteries of the heaviest siege-guns and mortars on the hills of Meudon, Sèvres, and Bougival, and no sign of an approaching diversion is anywhere visible—except in the stories of the newspapers, which continue to spread lies—patriotic lies, of course—as they did before the days of Wörth, Gravelotte, and Sedan. Jules Favre is said to be for peace, and there is also some talk about secret negotiations going on between Paris and Versailles, the headquarters of King William.

Bazaine, in Metz, continues very active. He apparently still cherishes the hope of breaking through the northern line of the besieging army, and effecting his escape, *via* Thionville and Montmédy, to Mézières—an arduous task indeed. By way of diversion, however, and possibly with the intention of merely thinning, by fighting, the ranks of both armies—a result doubly advantageous to the besieged—he occasionally also assails the southern lines. A severe fight, south of Metz, took place on the 3d, several brigades being engaged on both sides; but the sortie accomplished nothing definite. The wounded French were left, intentionally, on the field. On the following days some fighting and cannonading was carried on around the northern fortifications, the Prussians eventually occupying various positions nearer the town. In order to recover these, Bazaine, on the 7th, after a cannonade, suddenly advanced under cover of a thick fog, sweeping away the Prussian outposts, and, throwing heavy masses on their supports, drove the enemy from their new positions, and sent a large force onward, close to the Moselle, simultaneously making a feigned attack on various points to the north-east of Fort St. Julien. The onslaught, at first, proved very severe to the Prussians, but their artillery soon checked the French advance, and, the Landwehr vying with the line in bravery, the assailants were finally repulsed at every point. They continued, however, to show a threatening front, and on the following morning compelled the Prussians to draw up their reserves, while a furious cannonade from Fort St. Privat kept their southern lines on the alert. Large bodies of troops were engaged in the contest on both sides; the losses in killed and wounded were severe on both, Bazaine losing besides a considerable number of prisoners. Soissons and Bitsch continue to hold out bravely against the besiegers.

Outside of the *rayons* of the besieged fortresses, the operations of the Germans are everywhere successful. An important military affair took place on the 6th between Bruyères and Raon, in the north-eastern part of the Department of Vosges, where a body of Baden troops, about 6,000 strong, defeated a considerably larger force of French regulars, Gardes Mobiles, and riflemen. The fighting was obstinate, and lasted six hours. The French retreated westward, towards Rambervillers, leaving six hundred prisoners in the hands of the enemy. The latter seem to form a part of the forces, consisting of the main portion of General Werder's Fourteenth Army Corps and of Baden reserves, whose destination is to advance on Besançon and Lyons, after reducing or masking Schlettstadt, Neu-Brisach, and Belfort—which was falsely reported abandoned—and clearing the defiles of the Vosges. West of Paris, we find the Prussians all along the eastern border of the Department of Eure-et-Loir, from Dreux to Toury, and in the vicinity of Gisors and Vernon, in Eure; and north of it, as far as Ribemond, in Aisne, whither they retired after a slight repulse suffered at St. Quentin. South of Paris a severe battle was fought on the 10th, at Artenay, in Loiret, which ended with a decided defeat of the French, whose force consisted of several brigades, mainly sent from Tours. This combat was the greatest effort yet made for the relief of Paris by the outside Government. Gambetta may possibly quicken its further efforts by his energy, and Garibaldi, too, who arrived almost simultaneously with him, may do something by his republican enthusiasm; but with half of the republic clamoring for protection instead of sending aid, and with Lyons, Grenoble, and Marseilles troubled by red-republican, socialistic, and federalistic agitations, while the peasantry still cling to their Napoleon, and good arms and good officers are wanting, the chances of achieving great things must be said to be very slight. The elections for the Constituent Assembly have again been postponed.

There is a great deal of talk in the telegrams of the work that is going to be done by a new army which the French are organizing, or have organized, called the "Army of Lyons," of whose movements, present or prospective, we hear nearly every day. Great hopes, too, seem to be laid, by some people, on the "francs-tireurs," who are engaged, to a greater or less extent, in waylaying small bodies of Prussian cavalry, and have, in one or two cases, attacked convoys. We are also promised as sure to come, and sure to make a clean sweep of the Prussians, a "levée en masse" of the peasantry. There is no great difficulty in forming a conclusion about all this talk. It is hardly necessary to tell anybody who knows anything of the nature of the work called organizing an army, that to organize one out of the French peasantry and artisans—one capable of resisting the Prussians or relieving Paris—not weeks, but months, would be necessary; that the Prussians have now masses of cavalry and infantry in motion, besides the forces which are besieging Paris and Metz, sufficient to make anything like the organization of such an army in any part of France impossible. The troops raised hereafter, and which cannot join Trochu or Bazaine, will consist of small bands, which may annoy the Prussians, but cannot affect the fortunes of the campaign. The "Army of Lyons" is undoubtedly a mythical army.

As regards the value of the "francs-tireurs" and of the "levée en masse," we cannot do better than turn to the well-known work of General Trochu on "The French Army," of which the world has heard so much, and which did so much to raise him to his present responsible position. "There is," he says, "a prejudice dear to the multitude, and which dominates, above all, in French traditions, namely, the importance and value it attaches to that particular state of mind of an army called *enthusiasm.* What stories have there not been told of the enthusiasm of the first armies produced by the Revolution of 1789, and which were opposed, under Dumouriez, to the Austro-Prussian coalition invading our territory; and what effects have not the opinions of that day, reflected in history, not ascribed to it, touching the military successes which disorganized the coalition! The truth—which the General-in-chief reveals himself, and which Marshal Gouvion St. Cyr, who made all the campaigns of the Rhine and Moselle, exposes with great authority and with many interesting details—was, that the portion of the troops which specially represented the 'enthusiasm' of that army *were constantly, at Valmy, Jemappes, and Neerwinden, a hindrance and a peril to the intelligent* operations of Dumouriez." After citing as additional illustrations the failure of the Scotch Jacobites in 1715 and 1745, and of the Vendeans after the Revolution, he goes on to say: "Enthusiasm in armed masses creates what Marshal Bugeaud used to call 'les ardeurs du départ,' ephemeral ardor, which is unable to resist severe fatigues, and the effects, often overwhelming, of change of climate, long protracted nervous strain, and still less reverses. By an inevitable and dangerous reaction, it is followed, above all in the mobile and impressionable French imagination, by a lukewarmness which soon turns into despondency when bad fortune comes." Testimony of this kind is not to be treated lightly.

The stories of Prussian cruelty and depredations were for a while confined to the Paris papers, whose very extravagance and absurdity, however, rendered their charges harmless. Recently, two or three Englishmen, as well as Azamat-Batuk, the notorious "Turk" of the *Pall Mall Gazette*, and the Duc de Fitz-James, a French legitimist, whose word is not to be lightly doubted, have told horrible things of the burning of the village of Bazeilles, near Sedan, and of the plunder of the houses, and the perishing of the women and children in the flames, and of the dreadful sufferings of the French prisoners after the surrender from hunger and exposure. The accusations were so circumstantial that even Prussian partisans in England began to admit that the Prussians must be growing brutal. But a torrent of testimony has now been called forth on the other side, such as, we venture to say, was never before paid to the conduct of a large army operating in an enemy's country. Witnesses in dozens, whose opportunities of observation have been very great, and who know what war means, have come forward to say that such discipline, such kindness and forbearance, such respect for women and for private property, they never saw on the part of troops on hostile soil, as the Prussians are showing. Bazeilles, it is true, was burnt, and women and children perished in the flames—but it was set on fire in the course of a murderous conflict, during which it changed hands twice, the defenders each time being driven out house by house at the bayonet, and when it was finally swallowed up by the fire, the German wounded perished in it as well as some of the inhabitants. It was horrible, but it was war, and civilized war, too, we are sorry to say. As regards the sufferings of the French prisoners, they are all explained and the captors fully exonerated by the single fact that, after three days' hard fighting, following on a week of forced marches, the Germans suddenly found themselves saddled—no other army has probably ever had such a story to tell—with 120,000 prisoners, some 30,000 of them wounded. The later witnesses make the strongest acknowledgments of the extreme humanity and even tenderness with which the French prisoners were treated on the march and now in camp in Germany.

The stories of Russia's preparing for an immediate attack on Turkey, which were put in circulation last week, have, as we expected, disappeared. The *Tribune*, on whose imagination the Turkish question seems to have most disordering effects, even went so far as to get the Russian fleet ready for action, and announced that Russia had forty-three war-vessels in the Black Sea, although in the same paper, if we remember rightly, there appeared a synopsis of the Treaty of Paris, which expressly forbids the maintenance of any military fleet in the Black Sea. The only Government vessels Russia has there are revenue cutters. Moreover, the notion that Russia would attempt anything so hazardous as a march on Constantinople without having possession of the Black Sea, and leaving the Turks or English the opportunity of cutting her communications or operating on her flank, is simply preposterous. We believe, however, there is little doubt that a perfectly good understanding exists between her and Prussia, and that when the war comes to an end, as it will without Russian interference, Russia will demand, and will obtain, a revision of the Treaty of Paris, which will permit her to rebuild the fortifications at Sebastopol and restore her fleet in the Euxine. In the meantime, the Sultan is busy, might and main, arming his troops with breech-loaders—the Remington factories in this country being under contracts for enormous deliveries. But it is hardly possible for him to save himself now by military science, and the next ten years will probably witness some great change in the Ottoman Empire.

Elections for State officers and representatives in Congress took place on Tuesday in Pennsylvania, Ohio, Indiana, Iowa, and Nebraska. As we go to press, the returns indicate not only that the Republicans have held their own, but that they have made some unexpected gains. The colored vote has had a perceptible effect, and it was generally polled without difficulty; but in Philadelphia, where the hostility of the police and city authorities was disgraceful, it was necessary for the United States Marshal to call out the marines to preserve order. Whether the Germans deserted the Democracy in any considerable number, we have no means of knowing. The districts in which there was a split among the Republicans were generally carried by the regular candidates, Judge Kelley for one proving more than a match for his "anti-coolie" opponent, General Thomas. Nebraska and Iowa are strongly Republican, and Ohio perhaps gains a Congressman. Mr. Schenck has been run very closely by Mr. Campbell, and his fate is as yet undecided. Indiana probably ranges itself on the Republican side. On the whole, these elections will materially strengthen the party in the States which are to vote in the next few weeks, but it remains to be seen exactly how they will affect the New York election, or the complex struggles in Missouri and Massachusetts.

There was nothing very remarkable in the Massachusetts Republican platform. It dwelt on the reduction of taxation and of the public debt, and on the improvement in the collection of the revenue which had been brought about under Grant's administration. It had also a resolution urging the Government to press for a settlement of the *Alabama* claims, which would have been very timely and appropriate if it had not, by way of specification, fastened on the only point in the whole case in which England can make a good reply—namely, the prematureness and unjustifiability of the recognition of the South as belligerents. The doctrine that it was, as regarded the United States, not only an unfriendly act, but a wrong, for which satisfaction might be demanded in the forum of international law, was an invention of Mr. Seward's, and since his retirement from public life has only found one person calling himself a lawyer, and known outside his own district, with courage enough to uphold it. Mr. Sumner, we believe, persuaded Mr. Motley that it was all sound, and the latter wanted to have it embodied in his instructions when he went to England, but Mr. Fish very properly refused to touch it, and expressly adopted, in the President's message about Cuba, the well-established rule, that the recognition of belligerency is a discretionary act for which no nation is answerable to any other. Every foreign jurist who has noticed this controversy has treated this charge against England with ill-disguised contempt. We last week quoted Dr. Bluntschli's opinion about it. Since then, M. Blerzy has pronounced it, in the *Revue des Deux Mondes*, a "prêtendu grief," which calmer thoughts will banish, while stoutly defending the American case on all other points. The persistence with which some of our politicians here bring it up has not only burdened the case with extraneous matter which cannot aggravate the wrong and is not needed even to prove it, and delays the atonement, but makes us somewhat ridiculous to bystanders. The Massachusetts Convention, allowing itself at this time of day to be seduced into taking it up, and making it a cover for censure on the administration, is another illustration of the guilelessness of managers.

The Woman's Suffrage champions pushed the Republican convention in Massachusetts so hard that their application to have their plank inserted in the platform was only rejected by 196 to 139. This makes it seem very likely they will get it in next year if they will wait so long. But some of them won't wait, and are determined to have the plank in some platform or other, and accordingly talk of carrying it to the Democrats and seeing what they will do—which makes the *World* remark that the women seem to attach more importance to the act of voting than to the things voted for, an observation which ought to be biting, but we fear will not. In view of the remarkable capacity for a low order of political intrigue which the female leaders of the movement are displaying, we feel sure "the managing men" of the conventions won't have the face to keep them out much longer, and with female society the various "little games" will have a zest for the males they have never had before. "Whipping the devil round the stump" with the aid of a really sharp woman will be a sensation of which the most hardened old hack who ever drafted a meaningless resolution will acknowledge the novelty and delicacy.

We observe, by the bye, that the *Revolution*, the organ of the New York branch, speaks slightingly of the suffrage movement as a very small and subordinate affair. What *it* is working for, it says, is the "general emancipation" of woman, which we believe means—when we get down to the bottom of the matter—the abolition of marriage. Indeed, Mrs. Cady Stanton, the mother of the whole agitation, openly declares this is her end and aim, and everything short of this—to speak familiarly—fiddlesticks. The *Woman's Advocate*, the Western organ of the movement, has suggested a kind of compromise, in the shape of "limited marriage," or marriage for three years, the contract to be renewable indefinitely at the pleasure of the parties. In the case put by the writer (a woman), an interval of a year is inserted between the expiration of the first contract and the formation of the second, to enable the woman to go to college and look about her. She takes the baby with her, the father paying her for its "board," on the "ground that it might prove more of a care to him than it would to her, as she had been in the habit of looking after its personal wants." The *Modern Thinker*, a publication which we noticed a short time ago, and which touches on things unattempted yet in prose or rhyme, propounds the theory that women of high character, that is, we suppose, women with "views," will ere long have children at their pleasure, without any formal connection in the nature of marriage, and a few such women having begun it, that the practice will spread. Indeed, when one hears of some of the things to which, we are told, "humanity is marching," one can hardly help thinking that humanity stops at too many bar-rooms on the way, and regretting that there does not still remain some gross and palpable evil like slavery to give employment to the great army of reformers whom its destruction threw out of employment, or whom the success of the anti-slavery men has dazzled into taking up arms, and who are now spreading terror through the country. The number of people one meets with who can scarcely bear the constraint of their own skins, and to whom even the uniformity of weights and measures is a cruel yoke, is large and increasing.

The population of New York has now been determined by the census, and the published returns show the city to have about 930,000 inhabitants—a sufficient number, if one considers how largely they are packed away in tenement-houses, and that their increase from year to year is almost wholly foreign, and that the more they increase the smaller becomes the hope that the city can ever be purely governed on a basis of unlimited suffrage. If the census could somehow have been taken in the gross, we should have heard little of the Democratic complaints of its imperfection; but to have their election frauds exposed, district by district, was to put an unreasonable tax on the equanimity of our rulers. The *Tribune* has done good service—though it is sad to think what a slight effect it will have on our municipal politics—in comparing the votes cast in New York last May, in certain wards, with the total population as now ascertained. It selects thirteen districts, reckoning 15,956 residents, which nevertheless polled 7,535 votes (of which 6,964 were Democratic), as if out of every 212 persons—men, women, and children—there were 100 legal voters, when one in five or six should be the highest proportion. The most striking instance of those which went to make up this average was the Tenth District of the Sixth Ward. The population of this district amounts to but 870 persons of all ages and both sexes, yet in May it cast 50 Republican votes and 884 Democratic—in all, 934; thus showing that in this favored precinct, which must be a fragment of the ideal Irish Republic, nine-tenths of a human being is sufficient to constitute a legal voter. Such a privilege exists for the inhabitants of but few countries, and it is no wonder the *World* threatens violence against the United States Marshal and his deputies if they attempt to make the poll-list agree with the census at the next election.

The Free Trade League continues its labors with really Satanic zeal. We have before us a report which shows that it has, during the past year, held one hundred and seven meetings in this State, and in Indiana, Illinois, Iowa, Ohio, Wisconsin, and Michigan. It has distributed 250,000 tracts and documents, besides issuing, at a low price, a translation of the "Sophismes Économiques" of the misguided Bastiat, which it has had translated—and very well, too, as we were forced to admit at the time of its appearance—by the notorious Horace White, of the Chicago *Tribune*. The devil always has his literary work well done. It has also, as might have been expected, availed itself largely of the labors of the unhappy David A. Wells, whose reports it has widely circulated, thus unconsciously, of course, publishing his shame to the remotest corners of the Union. It has also carried on a paper of its own. It takes to itself, too—and he would be a bold man who would deny it—a large portion of the credit of the strong development, during the last session, of free-trade sentiment in Congress, and for the appearance of the same loathsome doctrine on the platforms of the Republican party in Maine, Connecticut, Illinois, Missouri, and Indiana. Of course, these unholy labors have not been accomplished without the expenditure of large sums of money; but everybody knows where this comes from, and we shall say no more about it.

Talking of the unhappy Wells, who has just come back from Europe, where he has doubtless been destroying his health and losing his money carousing and gambling with Mill, Newman, Bright, Laboulaye, and Chevalier, and other free-trade villains of that continent, we may mention that he has accepted from Governor Hoffman the appointment of a commissioner to examine and report upon the tax system of this State, and will at once enter on his duties. We may leave to the imagination of the reader the diabolical things he will say on this subject. We met, the other day, with a passage—which, comically enough, his friends think applicable to him—in the works of one Adam Smith, ostensibly a professor at Glasgow towards the close of the last century, but in reality a secret agent of the Jesuits, employed to poison the popular mind, in England, on the subject of the tariff. It was written in 1775, and the italics are ours:

> "To expect, indeed, that the freedom of trade should ever be entirely restored in Great Britain is as absurd as to expect that an Oceana or Utopia should ever be established in it. Not only the prejudices of the public, but, what is much more unconquerable, the private interests of many individuals, irresistibly oppose it. Were the officers of the army to oppose, with the same zeal and unanimity, any reduction in the number of forces with which master-manufacturers set themselves against every law which is likely to increase the number of their rivals in the home market; were the former to animate their soldiers in the same manner that the latter inflame their workmen, to attack with violence and outrage the proposers of any such regulation—to attempt to reduce the army would be as dangerous as it has now become to attempt to diminish in any respect the monopoly which our manufacturers have obtained against us. This monopoly has so much increased the number of some particular tribes of them that, like an overgrown standing army, they have become formidable to the Government, and upon many occasions intimidate the Legislature. The member of Parliament who supports any proposal for strengthening this monopoly *is sure to acquire not only the reputation of understanding trade*, but *great popularity and influence* with an order of men whose numbers and wealth render them of great importance. If he opposes them, on the contrary, and, still more, if he has authority enough to be able to thwart them, neither the most acknowledged probity, nor the highest rank, nor *the greatest public services, can protect him from the most infamous abuse and detraction, from personal insults*, nor sometimes from real danger, arising from the insolent outrage of furious and disappointed monopolists."

THINGS PLAIN TO BE SEEN.

The President, from whom some persons—we confess we were of the number—expected some assistance in the work of reforming the civil service, has been, during the past few months, doing a good deal to aggravate some of its worst evils. The Sickles appointment was startling, but Sickles had at least a "war record." That of Mr. Murphy to the collectorship of this port was the first open indication the public had that the hopes excited in the earlier days of the administration were going to be disappointed. Mr. Murphy's sole claim to General Grant's confidence rested on the fact that he was an active, energetic, unscrupulous New York politician of the "fast" type, versed in all the arts and devices peculiar to his class. He belongs to a school which, during the past six or seven years, has amused and disgusted all intelligent people in this city by its professions of intense sympathy with the great "moral ideas" of the Republican party, and with its horror of treason and corruption, but which finds no difficulty in furnishing Tammany Hall with plenty of candidates for its minor offices, and which, while frowning on Fisk and Tweed in public, is only too glad to drink their champagne in private, and laugh with them over the ups and downs of their common profession. Indeed, Mr. Murphy's love of horses, and his thorough knowledge of the art of using "offices" for party purposes, are the only reasons, so far as our knowledge goes, which anybody has ever had the audacity to put forward for putting him at the head of the custom-house through which the Government receives by far the larger portion of its revenue. Since his appointment we have heard no complaints whatever from the corrupt and disreputable band who form the Republican committees in this city of the "mismanagement" of the party, and we are not surprised to hear that the unfortunate clerks, whose salaries are already insufficient to support their families decently or to save them from crime, are at this writing undergoing an assessment, nominally to help to save the country from traitors, but in reality, as far as this city is concerned, to prevent one gang of peculators from being ousted by another.

This has been followed more recently by wholesale dismissals in Missouri of officers who were so ill-advised as to side with the Schurz wing of the Republican party. It would have been perfectly proper and reasonable to have forbidden all Federal officers to participate in the contest. As between two sections of Republicans about whose fidelity to the fundamental ideas of the party organization there is no question, and who have separated either on questions of strictly State interest, with which the Administration has nothing to do, and on which the President can hardly pretend to have an opinion to which Missouri men are bound to defer, or on questions of Federal policy on which the Republican party in Congress has hitherto found no difficulty in differing—the duty of the Administration is simply one of neutrality, and neutrality it ought to enjoin on all its officials, if it enjoins anything at all. It is hardly necessary to say to rational men that no party was ever yet saved from defeat or ruin by these devices. If its ideas do not retain sufficient hold over the people to make its triumph certain, the dismissal of lukewarm or hostile clerks and postmasters will not save it; and it is a fact worth remarking that, ever since the present tenure of office was introduced, the vigor with which this means of ensuring victory has been used has always been in the inverse ratio of the party strength with the public. Whenever the administration begins to apply the whip savagely to the poor jades in the public offices, it is almost a sure sign that its reliance on better things is growing weak. "Party discipline" in the custom-house and the marshals' offices and the Treasury was never so strict as in Buchanan's day, when the enemy was at the gates. In the Cabinet, there are two firm friends of civil service reform—two men who are convinced that, until the American people insist on it, we need not look for much else from a change of parties than a change in the nature and instruments of corruption—we mean Mr. Fish and Mr. Cox. The possibility of making much change for the better in his department was taken out of Mr. Fish's hands at the very outset by Mr. Washburne, who, having been appointed to the State Department *ad interim*, as a compliment, for one short fortnight, seized that opportunity of filling nearly all the consulates and other offices with his own creatures and hangers-on—an unprecedented performance, which might have prepared everybody, and did prepare most people, for the exhibition which he is now making of himself in Paris. Mr. Fish came into office, therefore, tied hand and foot, and since then the President, whose appanage the diplomatic service is, has apparently labored under no restraint. The appointment of Sickles and dismissal of Motley are acts which do not admit of explanation, and for which it would be ludicrous to apologize.

Mr. Cox has fared better. He has managed to introduce into his department—and particularly the Patent Office and Census Bureau—by simply putting in force a law which his predecessors disregarded, a real test of the intelligence and education of candidates for office, by substituting a *bona-fide* examination for a chat and a smoke, and the result is that he has now a set of employees such as the United States has not seen in its civil service for many a long day. It is needless to say that this has made him intensely obnoxious to "the men inside politics," who are laboring zealously for his removal, and whose hands his colleague in the Treasury strengthens very materially by studiously repudiating all desire for a change, and giving up his great army of subordinates to be "rotated," intimidated, and cheated, as the sub-managers of the party and the more unscrupulous Congressmen may please, and pretending to look on this seething mass of rascality and corruption as a necessary incident of "democracy." From the President at least Mr. Cox was entitled to look for hearty and continuous support, and we are not prepared to say that he has accorded him no support; but when we see him compel Mr. Cox, on the request of the party intriguers, to accord clerks a second vacation in one year, under full pay, in order to enable them to go home and vote, when they had been previously informed that they must either take their vacation at the voting period or forfeit their pay if they a second time withdrew from their duties, we find it very hard to say what it is the public service owes him, either as regards its efficiency or discipline. It is bad enough to allow one of his secretaries to make the Treasury a hot-bed of low jobbery, but it is worse not to stand by the others who try to do better.

Now, we do not mean to say that the worst results of persistence in this policy are yet visible. The Democratic party still manages to behave in such fashion as to keep the Republicans in power almost in spite of themselves. It would be hard for them to get into any scrape from which the Democratic chiefs would not do a good deal to extricate them. But one does not need to be a sage to see that even Democratic support is wearing out, that we must have new ideas and new plans, and that those new plans must be questions of practical reform. We must have a party which will reform the civil service, and so take out of politics the great element of that corruption which is day by day appalling the public; we must have revenue reform, and thus dry up another source of corruption, from which Congress is the most direct sufferer, but the effects of which on the industry of the country are also most pernicious. We must, too, have minority representation, which will give that half—it is only a slight exaggeration to call it so—of the voting population which is now excluded from all direct share in the government, and which contains a great deal of what is most thoughtful, conscientious, and intelligent in the population—a chance of being heard in the legislatures. We must have the Cabinet officers on the floor of the House, so that the country may have some better means of finding out what the Executive is doing than the gossip of Washington correspondents and the *ex-parte* statements of hostile and expectant Congressmen. There is a generation growing up rapidly to whom the controversies on which the Republican party is trying to live come only as a tradition of a state of things of which they have had no experience, and which will not be much longer amused by catch-words, and to whom the old politician and his esquire the old editor are becoming a pair of ancient and diverting persons, whose battle-cries are curious, but not exciting.

ALSACE AND LORRAINE.

From the seas to the Alps, Germany clamors for the annexation—or, as it is there called, the reannexation—of Alsace and Eastern Lorraine. It is a national cry which can surprise nobody. Germany lost

Alsace when the Thirty Years' War had doomed her to disintegration; she lost Lorraine when that disintegration was sealed by the rapid rise of the Prussian kingdom in antagonism to the power of the Hapsburgs. Both were torn from her by a rival neighbor, greedy of expansion and supremacy; she reclaims them at the moment when she is about re-establishing her unity, under new auspices, after an unprovoked deadly grapple with that rival, and after victories both so dearly purchased and so grand as to give her an uncontested right to dictate the terms of peace. It is not merely a popular clamor, raised by cheap journalists, by professional framers of resolutions, and other expounders, in prose or verse, of the trite theme, "Was ist des Deutschen Vaterland?" It is the expression of public opinion in the better sense of the term; of an earnest conviction pervading the German mind that the propitious moment for definitively settling Germany's old account with the French has now arrived, and that this settlement must be carried through, regardless of all opposition, and regardless of any amount of sacrifice it may still entail. It is evident that the current of national opinion in Germany in this respect is as even as was the tide of victory which carried the German arms to Paris—only very few making any attempts to head the torrent. That eminent publicist, Treitschke, vigorously urges the reannexation; Wolfgang Menzel, the historian, is naturally no less emphatic in demanding it—he whom so many years ago Börne called the *Franzosenfresser;* that more distinguished historian, Prof. Sybel, takes the same side, and so do Bohlmann and many other political writers of repute; and even Auerbach, the gentle novelist, exclaims: "Alsace must again become German; our stolen possession be again brought home."

But, in spite of this enthusiastic and almost unanimous outcry of Germany for Alsace and Lorraine, Count Bismarck, though himself not overscrupulous in matters of "revindication" and annexation, expresses no desire for those provinces—at least for neither in its entirety—and lays stress only on Metz and Strasbourg when speaking of the terms of peace. Even before the surrender of Sedan, and, of course, long before the fall of Strasbourg, he was determined to have those two fortresses, as he then told the *Tribune* correspondent at the headquarters of the King, but he repudiated the idea of annexing either Lorraine or Alsace. After Sedan, he expressed the same view before the same gentleman, but somewhat ambiguously. "Our people," he said, "think we must have those German provinces France took from us many years ago. We must at least render France powerless to menace us by the same road. Metz and Strasbourg we must have, and we ask no more than is necessary to our own safety." When, a few days later, Mr. Malet, the second secretary to the British Embassy in Paris, asked him for his ultimatum, he laconically answered: "We must have Metz and Strasbourg"—although the cession of "all Alsace and a portion of Lorraine" was then already much talked of in official circles of North and South Germany. In his circular of September 16, addressed to the North German representatives abroad, he speaks of "the unanimous voice of the German governments and the German people demanding better boundaries;" but his own reflections refer only to the two great fortresses, and he adds: "We shall demand only what we must have for our defence." In a later circular, it is true, he informs the diplomatic world that the possession by Germany of Metz and Strasbourg is to involve a new Moselle district, to be created for her out of the Lotharingian arrondissements of Sarrebourg and Château Salins (Department of Meurthe), Sarreguemines, Metz, and Thionville (Moselle); and another diplomatic missive, dated Ferrières, Oct. 1, finally announces that the cession of Strasbourg and Metz is to be "in territorial connection"—that is, that a portion, at least, of the Alsatian Department of the Lower Rhine, in which Strasbourg is situated, is to be added to the above-mentioned Moselle district—and that this "implies a reduction of French territory equal in area to the increase through Savoy and Nice," and a reduction of the population of France by about 750,000. But even these demands are still modest, falling short by more than half of those of "the people of Germany."

We do not know the precise reasons which determine the moderate course of Count Bismarck—moderate at least in comparison with what others advise as both legitimate and expedient. But we do know that there are many weighty arguments in favor of moderation. First, it is not true that Alsace and Lorraine are really German territories in regard to nationality. Geographically, it is true, they belong to the river system of Germany; a part of their rural population—chiefly of Alsace—speaks a German patois; and in olden times they formed divisions of the Germanic Empire. But there is hardly a population in France more sincerely French in sentiment than this border people of mixed descent; there is none more patriotically attached to the reminiscences of the Revolution and of the First Empire; none more bitterly hostile to the foreigner. East-Lotharingian and Alsatian Mobile and National Guards have had their full share in the obstinate defence of many a fortified place besieged by the Prussians. The war correspondence of Germany teems with evidences of the intense hatred which the inhabitants of Lorraine display toward the invaders; beyond Sarrebourg there is, according to the best testimony, "not a trace of *Deutschthum*" to be discovered in that province; and "that the Alsatians would be most disloyal subjects of the King of Prussia, in spite of the great majority of them speaking the German language and being of Teutonic origin," we have from the lips of Bismarck himself, if his words be correctly reported. And Bismarck himself, though he has silenced by imprisonment the voice of Dr. Jacoby of Königsberg—the most prominent of those who venture to set themselves against public opinion—and though very little disposed to respect the rights of the people whose territory Prussia needs "for her safety," must have felt the correctness of the staunch old liberal's words, "that every incorporation of foreign territory against the will of its inhabitants is . . . . as blamable as it is dangerous." The inconsistency involved, as Jacoby justly shows, in demanding Alsace and Lorraine on national grounds while keeping Posen would hardly frighten Bismarck from swallowing the new prey, if desired; but he is fully aware that a new Posen, and that severed from France and situated on its confines, can be no addition to the strength of Prussia.

And then the various difficulties in executing the annexation of those provinces to Germany must be considered. Granting that France will be forced to cede them, and Russia, Austria, and the rest of Europe will lay no obstacle in the way of the conqueror, to which state of Germany shall they be annexed? Bavaria and Würtemberg, kingdoms whose continued good-will is at this moment as precious as their services to the common cause in the war have been important, are decidedly averse to their annexation to Prussia, for this would make her envelope South-west Germany in a way little short of absorption. Their annexation, or the annexation of Alsace alone, to Bavaria would render this state, whose semi-independence is still somewhat obnoxious to Prussia, powerful enough to hold her own, and too much exposed to the temptation of recovering an entirely independent position by the aid of France, whose alliance she could then any moment secure through the restitution of the annexed territories. Würtemberg is separated from the French provinces by Baden; and Baden itself—the only one of the South-western German States which is unconditionally friendly to the supremacy of Prussia—would be dragged into the opposition by the weight of Alsace alone, were this to be annexed to her, and were she able to keep it. Nor must it be forgotten that the absorption of all Alsace and East Lorraine would, in any case, involve an addition of a million and a half of Catholics to the population of South-western Germany, that is to say, a considerable augmentation of the anti-Prussian element in that section—a section whose union with the states forming the North-German Confederation, whether under the present constitution of the latter or under a new one to be framed, is still a matter of time. This time may not be remote, but peace, if not a necessity of the present, is certainly the nearest objective point in the eyes of the Prussian statesmen, and they will but reluctantly consider any popular demands apt to augment the complications hampering its speedy conclusion or to endanger its duration.

TALKS WITH BISMARCK.

BERLIN, September 27, 1870.

BISMARCK's last two circulars—the first dated Rheims, September 13, and the other from Meaux on the 16th—indicating the policy which the

German cabinet will pursue towards France to end the present war, are models of diplomatic ability and terseness. It is a rare occurrence in the history of diplomacy that, in despatches like the present ones, the political facts and prospects are stated in such an open language and without the least reserve. Bismarck despises the crooked and winding ways of the old diplomatic school, and rather calls back to our memory the best times of Greek and Roman statesmanship. Only that statesman can speak so freely and frankly who has his whole nation behind him, and gives vent to its noblest feelings. There is no German who does not sign the annihilating judgment Bismarck passes upon the French, and from this time at least there will be no neutral who can justly complain that the ends and aims of Germany are not clearly stated. As in common life, so in great state affairs, sincerity and truth are, and always will be, the best tests for the correctness and justice of a nation's position; and, whatever may be said against the character of the German claims, no one will deny that they are incontrovertibly fortified by Germany's sad experience of French inroads and attacks in the last two hundred years.

Several English papers have lately published incidental remarks of Bismarck to English reporters and travellers, which all tend to show his great modesty in his conditions for a peace. His official despatches, however, prove how little these reports can be relied on. I do not deny that they are true, but I will state here, once for all, that all public sayings of Bismarck must be accepted with the greatest caution. He has his own way of making those of his views known to the world which he wants to have circulated. As leading statesmen in other countries make their electioneering addresses or dinner speeches, he invites an influential newspaper editor or correspondent, and in such an insinuating manner makes them the confidants of his often real, often simulated plans, that they implicitly believe in him. It is Bismarck's custom to flatter national wishes and prejudices whenever it serves his interests. In this instance, his remarks were expressly prepared for the English market, and he has fully achieved his object, as he has extended his sympathies with the English people. I do not say that Bismarck intentionally wishes to mislead people, but he dwells with emphasis on that side of a complicated question which he knows will find an echo in the heart of his hearer.

I have never known a man who is so full of resources as he. It is as if half-a-dozen intellects had served to compose his head. Physical and moral courage, shrewdness and an indomitable will, wit and humor, sagacity and recklessness, a certain intuitive comprehension of men's characters and calm steadiness, I do not know which of these qualities is most wonderfully developed in this modern Proteus, this personification—to finish the Greek simile—of both Ulysses and Ajax. He knows no practical nor theoretical difficulty, and if there were still a proof required that he really is a great statesman, it would be given in the fact that he handles the obstacles thrown in his way as the most efficient weapons for attaining his ends. Besides this, he possesses a frankness doubly surprising, as it always hits the point, and expresses itself sometimes in rough but always significant terms. Bismarck speaks English with a foreign accent, but likes to use it with his English visitors, and never misses the right word or the right expression, or fails to give a sharp point to his sentence. He enchants all his visitors with the affable manner in which he treats them. They expect to see a stiff, reserved state dignitary, and they find a ready talker, a witty companion, who laughs as heartily as they do, and with the same irreverence, at the official and unofficial nonsense which rules this world—who likes and makes a good joke, and chats with them as if they were old chums.

In his use of strong expressions Bismarck cannot be surpassed by the reddest radical. To a friend of mine he said: "If you have some business with a high Prussian functionary, a privy councillor, you must be so rough that to beat him would appear to be the next resort; then he will be polite and obliging." And on another occasion: "You have no idea of the self-conceit of the whole royal race." When he returned from his first interview with Napoleon, at Biarritz, he gave his opinion of the Emperor, who was almost deified at the time, in the few words: "A good fellow, but a poor stick!" To the Austrian minister, when this gentleman rather incredulously received one of Bismarck's assertions, he said a few weeks before the outbreak of the war of 1866: "I never make a false statement whenever I can avoid it. In your case it is not necessary. Therefore I have no earthly interest to deceive you, and you can believe my words." When I saw him in May last, Bismarck gave me some very interesting details about his endeavors to bring about the war against Austria. "I expected," he said, "to have been ready in the spring of 1863, but *our* Niebelung-treasure means the mobilization of 500,000 men, and it is difficult to raise it, to obtain the order from the King. On account of the secret and open opposition of the court dragons and of the intrigues and cotillon influences of princely and noble old women, it took three years before the King signed the order of mobilization and declared war. I was like a hunter creeping on his belly to get a shot at the game, but I finally struck it after enormous pains and efforts. Whenever I thought I had conquered all resistance, new difficulties sprang up. To this court rabble I am indebted for my sickness, not to my open and secret enemies. I knew beforehand that in 1866 we should beat the Austrians. Our generals, with the exception of great Moltke and bull-dog Steinmetz, were asses (*Esel*), but our fighting material was excellent; each soldier thought for himself, and the subaltern officers cannot too highly be praised for their intellect, education, and bravery. If we had been defeated at Königgrätz, I should have been obliged to leave the country, for to the hatred I richly enjoyed on the part of the Liberals was added the bitter animosity of the court rabble. An old friend and general who met me on the battlefield immediately after the victory was won, was perfectly right in saying to me: 'This time, Bismarck, our soldiers, with their needle-guns, have fought you out of the scrape, which is much better than if the old women, with their sticks, had driven you out of the country!' In the Luxemburg question, in 1867, I tried with all my power to avoid a war with France, for war is always a poor, losing business, and great nations have better things to do than to strive for military laurels. Once go to war and where will it end? Each year I gained I considered an immense profit. The French had also threatened England, and nevertheless it did not come to a war. I therefore thought it my duty to avoid it. If the French insist upon a war they shall have it, but I apprehend that we shall have a repetition of wars, succeeding each other, like those at the end of the last and in the beginning of the present century."

When Bismarck spoke these words, all Europe was in deep peace, and no one could have foreseen the thorough thrashing which the Germans would give the French.

"These diplomatists at small courts," Bismarck continues, taking up another subject, "are an unmitigated nuisance: shallow, lazy fellows who do not see and observe public affairs, but pick up court gossip from the chambermaids or ladies-in-waiting. What can you do with these good-for-nothing cosmopolitan loiterers? I cannot act as I should like to, but since I have been at the head of the foreign department, I have at least cut down the list of the fatherlandless Excellencies to one-half of their original number." In this way he went on for an hour with scarcely an interruption.

And this same man is a very strict disciplinarian in his department—a superior who hardly tolerates an independent man, who requires implicit obedience, and knows only servants and clerks, but not friends and advisers. In the present emergency, his direction of German politics is an advantage and blessing for our people. In its dealings with France it needs not only a tried diplomatist, a haughty and fiery spirit, but also a man who acknowledges no superior to himself, who can in no way be duped and trifled with—a man, in short, who knows how to make his nation's *sic volo, sic jubeo*, respected by the whole world. In all her foreign relations Germany cannot be more ably represented than by Bismarck, and as long as they occupy the foreground of events, he will act and always be found in sympathy with his people.

The popularity, however, which he has won by two successful wars, will, I apprehend, wither in the times of peace. Bismarck has neither interest for nor understanding of civil freedom, self-government, and constitutional liberty. His is a despotic character, he is an ingrained legitimist, who considers it his special calling to hold down popular development if it does not directly serve his purposes. What Germany next needs is a Bismarck for its home policy, a man who knows how to develop more fully, or rather to give free scope to those rich resources and qualities of character by which Germany has just won the admiration of the civilized world and earned the hatred of the French and the Fenians. In her days of misfortune and national degradation she had such a man in the great Baron Stein. Will she be less productive in the success of her military greatness and prosperity?

Let me conclude this hasty sketch with an anecdote which proves that the common saying that the sons of great men do not amount to much—*heroum filii nequam*—has its exceptions. Bismarck's sons have at least inherited the wit of their illustrious father. While studying at Bonn they were often visited and bored by English travellers who went sight-seeing, and for this purpose called on the sons of the Prussian statesman. One day one of the young Bismarcks—the same who for his bravery in the field has just been made an ensign by the King—passed down stairs, when he met several English snobs, trying to see the young man. "Is this the place," they asked, "where the Counts Bismarck live?" "Yes," replied young Bismarck, "this is their residence; but the show only takes place twice a week, and you will have to call another day," and therewith he went his way.

FRIEDRICH KAPP.

Correspondence.

YOUNG YALE ONCE MORE.

TO THE EDITOR OF THE NATION:

SIR: Unless you are utterly wearied with the whole subject, may a middle-aged Yalensian, near enough to the meridian to be identified with Young Yale, say a few words?

At the recent Commencement of Yale College, the active co operation of the alumni with the instructors was made a subject of special consideration. It was generally conceded that, notwithstanding the liberality of Yale's benefactors, money could be better applied to "bread and butter" than to "bricks and mortar." The Faculty were under-paid, the library needed funds, and the law school deserved to be placed on a better footing —in short, your article on "The New Education at Yale" (Feb. 3, 1870) expressed the views of many alumni in reference to the whole College as well as to its different departments. Your readers not graduates of Yale should know that Wednesday, the day before the commencement exercises, is peculiarly the alumni meeting—Thursday afternoon being given up to after-dinner speeches and class responses. At Wednesday's meeting the discussion was in a great measure devoted to devising some plan by which the graduates could manifest a practical interest in the everyday life of the College; it ended, as most alumni discussions end, in the appointment of a committee and the accomplishment of nothing. Of course the idea of alumni co-operation was not only suggested but strongly urged. Young Yale claimed a right to participate in that which it was asked to foster; it requested representation where there was to be taxation, offering to bear its full share of the burden. This was the state of affairs on Wednesday; naturally the same subject was referred to on the succeeding day; and it is the response on behalf of the class of 1860, at the alumni dinner of Thursday, which has called forth so much criticism in your columns from "M. A." to "Great Cry and Little Wool." It is not my purpose to defend the speech then made; its author can properly care for himself at any time; it gave great satisfaction at the time, not only because, coming after a very poor dinner, it was good of its kind, but also because it had the ring of something more progressive than had been heard at Yale College for some time. Young Yale had already spoken in behalf of alumni co-operation by Prof. Fiske, of Chicago, and through the class of 1855; the class of 1860 (by a spokesman whose views, by the way, are entitled to much respect from the "bread and butter" standpoint) wound up the subject very well with what President Woolsey termed the "second warning to the Faculty."

Now, it is not quite fair that either Young Yale or the representative of the class of 1860 should be classed in your columns as antagonists to clergymen, mere hunters after big-named men, or electioneerers for the President's son; it is not quite fair that the claims of Young Yale should be ignored for the purpose of criticising the phraseology of our after-dinner speech, or the letter of a correspondent. The evil exists that in (as we say) the first college of the country, a suitable and proper pecuniary support is wanting.

Young Yale thinks that a participation in the active business affairs of the college will interest her alumni in her welfare. Old Yale shrugs its shoulders at the innovation and suggests nothing.

Young Yale wages no war upon clergymen; it simply asks that practical business men, who manage their own affairs well, shall be equally eligible with ministers to a voice in the management of the affairs of the corporation. It is not with their cloth we differ, and if at times we think them as a class a little slow, they must bear in mind that as a rule the laity serve better as committees on ways and means, and look to their own parishes for the proof.

Young Yale sees no virtue in accidental senators, chosen by lot, participating in the corporate management; if the State and the college must be united, some better mode of selecting rulers could be devised than the caprice of the black bean.

We desire to see the college a university, its law school the first in the land, its library without a rival, the whole college life invigorated with zeal and energy, its Faculty not forced to teach at odd hours or coach dilatory students to eke out a livelihood not afforded by half-rations, and a sound pecuniary prosperity established in all its departments. We believe the young blood of Young Yale would better secure such end and serve our alma mater; at all events, a want of harmony among its alumni will do no good; and should a few white cravats give place to more gaudy neck-ties in uniting the different views of the alumni, the college will in our opinion be none the worse for the change. Anyhow, is it too much to ask of your critics justice as to Young Yale's motives even if they stick pins into its representatives?

C. G. C.

Notes.

LITERARY.

MR. J. S. REDFIELD will publish an entirely new edition, with revisions and additions, of Walt Whitman's "Leaves of Grass;" also, a sequel to the foregoing, entitled "Passage to India," and, in prose, "Democratic Vistas," by the same author.——Messrs. Roberts Brothers' fall list of publications is, as usual, a promise of entertainment for readers. It embraces: "The Monitions of the Unseen," and other new poems, by Jean Ingelow, with illustrations; a new edition of Judd's "Margaret;" "Ten Times One is Ten," by Rev. E. E. Hale, a story belonging to the "Ingham" series; "Aspendale," by Miss Harriet W. Preston, which the publishers say is not only a story but an essay, and, at all events, concerns New England life; Arthur Helps's "Essays written in the Intervals of Business," and "Short Essays and Aphorisms;" another of George Sand's novels, "The Snow Man;" "Pericles and Aspasia," by Walter Savage Landor; "Roman Imperialism, and Other Papers," by Prof. Seeley, author of "Ecce Homo," together with his "Lectures on Roman History;" and, finally, "Illustrations to Goethe's Faust," in silhouette by Paul Konewka, the accompanying text being from Mr. Bayard Taylor's forthcoming translation of "Faust." The juvenile books announced by Messrs. Roberts Bros., partly in connection with English houses, are too numerous to mention here, but will deserve the attention of purveyors for the holidays.——Several religious works are announced by Messrs. A. D. F. Randolph & Co.: "The Percys," by E. Prentiss;" "Looking Back; or, Memories of the Past," by Mary B. A. King; "Holiness through Faith," by R. P. S.; "Prayers and Devotional Meditations," collected from the Psalms of David, by Elihu Burritt; "Commentary on Paul's Epistle to the Romans," by W. S. Plumer, D.D.; and "Culture and the Gospel," by Rev. S. McCall.

—The following argument against the immigration of the Chinese—or the "coolie system," as it is called—was read the other day in Philadelphia at an "anti-coolie meeting." It came from Mr. Thomas, the late collector of the port, and we confess staggers us. Nothing Wendell Phillips has produced can compare with it for native vigor:

> "So much am I opposed to their coming, in consequence of the evil consequesces resulting from their contact with us to our morrals or politiks, and our labour, that I would if it were within my power build a chinese wall on our Western coast so high that it would be imposible for them to scale it. Whilst we cordially invite emigrats from Germany, Ireland, France, Prussia, &c. who come hearr to cast their lot with us, become naturalized and lay down their bones in our soil, we have a right to apply a verry diferent rule to those who come hearr for a few years to interfere with our labour, collect together a sum of money and then go back to China. They have indeed no right to come *hearr at all*."

—The London correspondent of the Boston *Daily Advertiser*, who was in Paris a few days before the city began to be really besieged, reports the observations which he made of that class of sojourners to whom we lately paid our respects—"the Americans in Paris." He studied them at "Thorpe's" and in the court-yard of the Grand Hôtel, and the picture, though it has been drawn many times, may still excite a blush among their countrymen at home who do not merit being so disgracefully misrepresented. The relations between wealth and culture are so different in Europe and in the United States that Europeans are not to be blamed if they take the worst specimens of us for average specimens, and conclude—as they justly may from what they see—that the morals of this republic are such as to make our pretence of being shocked at their morals seem downright hypocrisy. Until they are undeceived, they will probably continue to be, as the Germans have already begun to be, chary of receiving our boys and girls in their *pensions*, even when it is not visible at a glance that they are ill-bred, insubordinate, and immodest in dress and demeanor. Nor can we deny that people who are accounted decent and respectable over here become on the Continent spectators of if they do not participate in the most disreputable amusements, without the honest excuse which Glais-Bizoin offered to his fellow-deputies for having entered one night the Jardin Mabille—that he might see what admirable institutions France was indebted for to the Second Empire. The *Advertiser's* correspondent heard the talk of the Americans who drank their cocktails at Thorpe's, and he found them "more imperial than Palikao, more swaggering than Lebœuf, more dissipated than the departed Duc de Gramont." Their contempt for the provisional government—not as provisional, but as republican—was mingled with regret for the fate of Napoleon, and curses, if not of the Prussians, at least of the war, "not because of the misery it has brought, not because of the wives, mothers, and children it has made desolate, not because of the degradation it has inflicted on a sensitive country, but for the reason that profligate gayety is stopped, that fashionable amusements are suspended, that the Bois is empty, and that the great dandies and the fashionable youths have flown." The women at the Grand Hôtel were not less egoistic in their conversation. "They were, as a rule, almost pathetic in their regrets that the reign of fashion and frivolity was over, and one rarely heard a plaint from them concerning the war which did not bear directly or indirectly upon the pleasures they had lost."

—It is seldom that our modern reviews wander far from the current period in selecting books for notice, unless it may be to avail themselves of the new edition of an old work for a fresh judgment of the author. The *Saturday Review*, of September 17, however, devotes a full page to a small book, written in Latin, published in 1533, and now preserved as part of the Grenville Library in the British Museum. The reason of this remarkable departure from the usual custom lies in the fact that the volume seems to have escaped the notice of all the historians hitherto; and yet, without adding much to our knowledge of the facts in regard to the marriage and divorce of Catharine of Aragon from King Henry VIII., it curiously confirms and connects revelations only lately obtained from several different sources. Thus it corroborates the hesitation of Pope Julius II. to grant a dispensation for the marriage of the then Prince of Wales with his brother's widow—a fact favorable to the view taken by the Protestant side that the marriage was void *per se*, and that the dispensation finally granted for it was beyond the power of the Pope; (2) the non-consummation of the marriage of Prince Arthur with Catharine—a fact in accordance with the Queen's own persistent assertions; and (3) the intention of Henry VII. and actual proposal to marry himself his son's widow—which agrees with the testimony of the Simancas Record, as first discovered by Bergenroth. The second statement is sustained by transcribing in full in the original Spanish a letter from Ferdinand to his ambassador at the Court of Rome, admitting that, though it was well known that the marriage had not been consummated, the contrary was asserted in the dispensation sent to the Pope for his approval—the object being to have a dispensation which should cover all possible objections that might afterwards be raised, and be itself protected against doubts as to its own validity.

—The French having chosen to put forward their struggle with Prussia as one of races, and the Prussians having accepted this view so far as to speak disrespectfully of the Latin race, perhaps even a little contemptuously, we are glad to observe that the Italians are not disposed to allow France to usurp the prerogative of defending the common stock against its traducers. They improve the occasion of the overthrow of the Pope's temporal power to remind Germany that Europe is indebted not only to the Latin race for the example of separating church and state, but to that portion of it which lives south of the Alps. And modern Italy need not be ashamed of a great many other examples of genius and of institutions. "The eagerness of the French to appear as the political heirs of Rome" was remarked by Du Bois-Reymond, rector of the University of Berlin, in dismissing the students for their war-vacation on August 3:

> "In one respect," he went on to say, "they are thereby greatly wronging themselves, for they vastly surpass the Romans in mental fertility and æsthetic endowments. But while we cannot absolve them from the vices of imperial Rome, we cannot give them credit for the virtues of the Roman republic. The talent Romans had for colonization is entirely wanting, the best results which they were able to glean from the conquest of Algiers consisting in the peculiar aptitude of the original brood of pirates for being utilized in their own mode of warfare. . . . Can anything be more silly than the analogy adopted by the French between their kingdom, their First Republic, their First Empire, and the nominally apposite phases of Roman history? This fiction had its origin with the First Napoleon, who thereby made the form of government of imperial Rome palatable to the French. The faith therein is carefully nurtured by the nephew. His uncle is *Cæsar;* the ungrateful peoples who would not accept their beatitude at his hands, but shut him up at St. Helena, are Brutus and Cassius; he himself, of course, is Octavius."

—We have thus far only seen two public expressions of feeling and opinion about the war, and the terms of peace, emanating from Frenchmen, which we could read without regret. One comes from Auguste Laugel, who is well known in this country, in a letter to the *London Times*, and the other from Ernest Renan, in an article in the *Revue des Deux Mondes*, of September 15, of which only a few copies have reached this country. M. Laugel frankly admits that none of the public men of France opposed the war as it ought to have been opposed, but declares that the curse of the Imperial régime was that the public men who grew up under it did not represent France, and that there is in France a public, of which M. Laugel is one member, which the Empire crushed out of sight, but which, now that the Empire is gone, may be depended on to resume its legitimate weight, and give Germany such moral guarantees for future peace as will make material ones unnecessary. He says German unity is based

> "on unparalleled development in all branches of human intellect, literature, poetry, philosophy, and science. This feeling of German unity was merely poetical at first; if it has taken a material, and, perhaps, too material a form, it is owing to the cruelty of the first French Empire and to the insolence of the second. I believe that the ungenerous policy of '*divide ut imperes*' ought to be abandoned by France; and I am no more disposed to interfere in the interior affairs of Germany than in those of America."

He goes on to add, however, that all depends now on Prussian moderation. Prussian excesses may bring a restored Empire, or a socialist republic, which would be the ruin of France, while a liberal monarchy or a conservative republic would give her a policy of non-intervention, disarmament, of economy and honesty; and he asks for indulgence for the present holders of power, as the acceptors of a terrible heritage. In fact, wiser, calmer, truer words have not yet been spoken on behalf of France. But then, many French sympathizers in this country will be shocked by M. Laugel's demand for a "liberal monarchy, a *conservative* republic," which makes us fear he does not understand France, Frenchman though he be. If he will only come over here, we will put him in communication with a few friends in Massachusetts who have never set foot in that country, but who will make it plain as a pikestaff to him that what France needs is a real roaring, radical, frantic red republic, with clubs, lectures, six-hour laws, occasional redistributions of property, and, in fact, a frequent overhauling of the whole social organization from garret to cellar.

—Renan's article, which is entitled "La France et l'Allemagne," has all the brilliancy, incisiveness, and clearness which give the best French writing so much of its charm, but, at the same time, a breadth of view, and a keenness of the historical sense, and elevation above all passions of the hour, which make him, perhaps, the most effective and instructive of living French political commentators, and make one regret that in this field he has done so little. He talks coldly, to be sure, as one who really feels, as he says, that this war, over which Europe is weeping, "like all else here below, is only an episode in an everlasting dream—a wrinkle on the surface of an infinity which produces us and then absorbs us;" but his coolness, in a time of general heat and brawl, serves, as an aid to reflection, all the purposes of silence and seclusion. He says the war is an awful misfortune, which puts an end for the present to the prospect of a close union of France, Germany, and England in the work of civilization. The Germans are naturally "separatists," but the idea of unity was bred amongst them, by French brutality, first under the French monarchy and then under Napoleon I. The new Germany is the result of the battle of Jena. The agitation was put to sleep by the sage policy of Louis Philippe; it was roused into activity by Louis Napoleon's Italian war and the annexation of Nice and Savoy. From that moment, France began to be again suspected, and justly suspected, by Germany. Austria, being two-thirds Slave, could never form the nucleus of Germany; Prussia became so naturally; and the basis of the Prussian monarchy being the northern provinces, still under the domination of feudal ideas, and possessing a feudal social organization, her progress has been tainted all along by feudalism and is still characterized by it. Bismarck's plans were elaborated with the knowledge and approval of Louis Napoleon, but the latter was obliged, in order to be able to make head against the "taquineries" of the opposition, to ask for what Germany could not be expected to cede, while Bismarck found himself forced by German opinion into an attitude towards France which was no part of his original programme. He denies that war between the two countries was inevitable. Time would probably have removed the danger; the death of the present King, and the accession of the Crown Prince, of the wisdom and moderation of whose character, and that of the Princess, he speaks strongly, would have changed the state of things in Prussia. He charges the responsibility of the war, however, partly on Prussian hardness, interestedness, and want of generosity, but mainly on the superficiality of French newspapers, the presumption and obstinacy of French military men, but more than all on the "pouvoir personnel" of the Emperor. He protests strongly against the abstraction of Alsace and Lorraine, as likely to prove fatal to French unity, and predicts, as the result of the subsidence of German fear of France, the disappearance of Prussia from the scene, or, rather, its absorption in a free and united Germany; but as long as France and Germany remain at daggers drawn, Prussia, in virtue of her military power, must predominate. Some of his analyses—such as that of the causes of present German hostility to France, and his reasons for believing that France cannot copy the Prussian military institutions—are striking and interesting. Indeed, the whole article is perhaps the most valuable contribution yet made to the literature of the war, and forms a strange contrast to the hysterical cries and vain babblings even of such men as Louis Blanc and Charles de Mazade.

—The Imperial Public Library of St. Petersburg has received a valuable contribution from General Abramoff, commanding in Turkestan. It is a copy of the Koran belonging to the Caliph Osman, and said to be the one written by Osman himself, which he was reading at the time of his death, his blood-stains being still visible. It was one of the treasures of the library of Tamerlane, and has been for a very long time preserved in the Mosque Hodja-Akhrar at Samarkand, having been presented to its founder by the Caliph at Constantinople. General Abramoff obtained it in return for a few hundred roubles presented to the mosque. The manuscript is written in the Cufic script, without points or marks, and, whether it is or not the original of Osman, is unquestionably of very great antiquity, and has for hundreds of years been an object of adoration at Samarkand.

—The efforts to settle the Hebrew question in Western Russia, where the Jews form 36 per cent. of the population, and where they have in their hands nearly all of the trade, and in the north-western provinces 73 per cent. of the real estate in the cities and towns, has led to the publication at Wilna of a very curious book—"The Book of Kahal," by J. Braphmann. It consists chiefly of authentic documents signed by the rabbinical authorities, with the necessary explanations and excursuses. These go to prove that the Jews in Western Russia form separate aristocratico-republican communities, bound together among themselves, with their own government, laws, judges, and schools, living among but totally distinct from the native populations. They have even their own language—Hebrew for documents, and a mixture of German, Polish, and Hebrew for common life. This rabbinical government is called the Kahal, which possesses an unappealable despotic power, and the laws are derived from the Talmud. The Jews are forbidden by the Kahal ever to have recourse to the Russian tribunals, and the doctrine is stated that the Russian laws are not binding on them. According to the author, the Kahal does much more than the Government to prevent the Jews from coalescing with the Russian population, as their regulations penetrate to the innermost details of private life, regulating the number of guests at feasts and marriages, the musicians, etc. The instruments by which the patrician caste keep their predominance over the plebeians are excommunication, which in a town almost entirely Hebrew, such as Berditchev, is civil death, and the taxes which are exacted from various things, and especially from the butchery of cattle according to the Mosaic law. These taxes, curiously enough, are sanctioned and enforced by Russian laws. Sometimes the Jews turn the tables on the Christians, and make them pay the taxes for Jewish institutions. The Kahal, for instance, is allowed a tax on all liquor sold in village taverns kept by Jews. In the north-western provinces, there are no other country taverns, and the tax of course falls on the consumer. In Wilna, a tax was allowed on all provisions sold in a certain quarter of the city inhabited chiefly by Hebrews, and they subsequently succeeded in getting the city fish-market moved there. One curious fact alleged by M. Braphmann, himself a Jew, and seemingly proved by his documents, is that the Kahal regards the property of all Christians as unoccupied and belonging to itself, and sells the right to obtain possession of this in any way from the Christian owner. After such a sale, no other Jew has a right to lend money on the property or buy it. If a Jew buys or gets hold of a Christian's property not previously sold by the Kahal, he must pay a large sum to get a proper document from the Kahal before he can be recognized as the legal owner, under penalty of excommunication. Such a state of things seems in the highest degree improbable, but very curious details are given, and one case is brought up of the sale in this way of the right to *exploiter* and get possession of a whole Franciscan monastery. At all events, the book throws light on some very interesting customs of the Russian Jews. It has already called out a series of severe articles against the Hebrew patriciate in the *Golos*, and has been sharply criticised by the Jewish organ, *The Day*, of Odessa. Many of its statements have, however, been confirmed by recent instances cited by various Jews in other papers. Perhaps some one else will take the subject in hand and give us a true picture of life in these purely Jewish communities.

—We regret to notice that a useful Anglo-Chinese publication—*Notes and Queries on China and Japan*—has been discontinued, owing to certain difficulties encountered by the new proprietor and editor, Mr. Davies. Originally projected and for three years edited by Mr. N. B. Dennys, it was well supported by sinologues and oriental scholars, the names of S. Wells Williams, Edkins, Dr. Martin, Medhurst, Mayers, Schlegel, Galton, and others of celebrity appearing in its pages, while warm testimony to its value was accorded by the press and various literary correspondents both in this country and Europe. Its decease will be a real loss to all interested in Chinese and Japanese life and literature, but it will, we hope, before long, find a successor supported by the same talent as that which rendered it so successful in the beginning.

—A convenient table is given in the last number that has come to hand of the *Chinese Recorder and Missionary Journal*, an unpretending little periodical published at Foochow. Despite the improvement in modern geographies, we very much doubt if one person in ten thousand, not resident in China, could name the provinces and capital cities of the Celestial Empire; while few have any but the vaguest idea of the districts into which they are divided. The following will therefore be interesting to many—the more so that, next to the open or "treaty" ports, the cities named in the second column are those most frequently referred to in Eastern correspondence:

Province.	Capital City.	Departments.	Sub-departm'ts.	Major Districts.	Minor Districts.	Totals.
Chih-li . . .	Pao-ting-fu . . .	11	..	23	123	157
Kiang-su . .	Kiang-ning-fu . .	8	3	6	62	79
Ngan-hui . .	Ngan-king-fu . .	8	..	9	50	67
Kiang-si . .	Nan-chang-fu . .	13	2	2	75	92
Che-kiang . .	Hang-chow-fu . .	11	3	1	75	90
Fokien . . .	Foo-chow-fu . . .	10	..	2	62	74
Hu-peh . . .	Wu-chang-fu . . .	10	..	8	60	78
Hu-nan . . .	Chang-sha-fu . .	9	4	7	64	84
Ho-nan . . .	Kai-fung-fu . . .	9	1	10	96	116
Shan-tung . .	Chi-nan-fu . . .	10	..	11	96	117
Shan-si . . .	Tai-yuan-fu . . .	9	..	16	85	110
Shan-si . . .	Si-ngan-fu . . .	7	7	10	73	97
Kan-suh . .	Lan-chow-fu . . .	8	2	13	49	72
Szu-chuen . .	Che'eng-tu-fu . .	12	9	19	112	152
Kuang-tung .	Kuang-chow-fu . .	9	2	11	78	100
Kuang-si . .	Kuei-lin-fu . . .	11	..	18	47	76
Yun-nan . .	Yun-nan-fu . . .	14	5	29	39	87
Kuei-chow .	Kuei-yang-fu . . .	12	5	14	33	64
		181	43	209	1,279	1,712

According to the received accounts, which estimate the total number of officials of all grades at a little over 30,000, this would give an average of 110 to each department. The remainder of the number under notice contains some able papers on miscellaneous subjects; "Chinese Arts of Healing," "Marco Polo and Ibn Batuta in Fokien," with a paper on the aboriginal or Miautzŭ tribes of China, are the most noticeable.

—A correspondent informs us that the edition of Marco Polo by Pauthier, to which we referred in our issue of Sept. 29, is likely to be superseded by an English version, now being prepared for the press by Colonel Yule, the well-known orientalist, whose "Travels of Ibn Batuta" show his fitness for the new work he has undertaken. Colonel Yule has been most indefatigable in collecting material, and has been specially aided by residents in China, who have collected much information regarding the geography of places no longer known under their former names, and the identification of which has hitherto been most unsatisfactory. Considerable labor has been expended in defining the old port of Hangchow, once the chief mart of China, but which no longer exists, even in maps dating back to the beginning of the last century. A sandbank now occupies the place of the once famous harbor, and all recollection of its former greatness has totally disappeared amongst the few fishermen who now inhabit the locality. Many disputed points are likely to be cleared up in the forthcoming edition, thanks to the attention which Colonel Yule has succeeded in exciting on the part of brother orientalists. Since Pauthier's time considerable light has been thrown on the generic or tribal names used by Polo in his references to the Chinese of his day, and in this respect the editor's labors are likely to afford some novel and interesting information.

THE PROPOSED REVISION OF THE ENGLISH BIBLE.

I.

THE ORIGINAL TEXT, AND ITS EXEGESIS.

THE surpassing general excellence of the standard English translation of the Bible is universally admitted. In accuracy of rendering, it acknowledges no inferiority to any other version of the Jewish and the Christian Scriptures; in purity and beauty of style, it is the first of English classics; and its diction and special grammatical structure are appropriate to the matter in a degree of which modern literature offers no other example. The revision of such a translation can have but two legitimate aims—first, the correction of errors arising from the adoption of a corrupt original text by the translators, or from a mistaken interpretation of the text; and, secondly, the substitution of more appropriate words or forms of expression for terms and phrases which are now wholly obsolete and unintelligible to the ordinary reader, or which, through changes in the language and in the tone of social culture, have become inapplicable, or suggestive of low or revolting images or associations, offensive to the sound taste and the moral sense of the present age.

The labor of revision, hence, obviously divides itself into two branches—the establishment of the original text, and the adaptation of the translation to the revised original. The first of these tasks is probably both the least important and the most easily performed. It is generally allowed that, with a very few well-known exceptions, the discrepancies between the best Hebrew and Greek manuscripts of the Old and New Testaments are not so great as to affect materially the interpretation of any of the texts relied upon as evidence in support of any particular tenet; or, to give this idea another expression, they are not such that, if two or more honest, unprejudiced, and otherwise competent enquirers, using different original texts selected from those recognized by the learned as the best, should arrive at different conclusions as to what the Scriptures really teach respecting the leading doctrines of the Christian faith, their diversities of opinion would be founded upon or occasioned by other considerations than a difference of reading. This view of the subject is happily confirmed by the fact that the numerous translations of the Bible, old and new, oriental and occidental, though following different original authorities, agree so closely in the main that almost any one of them might, without great improbability, be supposed to have been taken from the same text as any other that least resembles it. The Catholic must found his distinctive doctrines on something more than textual discrepancies between the authoritative Vulgate and the manuscripts used by the Protestant translators and theologians, and the Protestant must maintain his special religious belief on other grounds than Scriptural declarations which he holds to be misinterpreted in the Vulgate. The Biblical student of the present day, who compares the New Testament as given in the Bishops' Bible of 1568 with the contemporaneous Romish version by the "Papists of the traitorous seminary at Rhemes," will not find sufficient ground for the violence with which Martin and Fulke assailed, respectively, the supposed corruptions of translations which by no means differed so widely as did the theological opinions of the disputants. The Bible of 1611 itself, though to the best ability of the revisers everywhere conformed to the Hebrew and Greek texts, nevertheless agrees in a surprising measure with the Wycliffite translations of the fourteenth century, which are known to have been founded on the Vulgate and other early Latin versions.

So far as the Old Testament is concerned, there is little reason to expect the discovery of authentic manuscripts which will justify essential alterations in the generally received text. At the same time, the progress of linguistic learning and the study of early oriental translations, and of other branches of Eastern sacred literature, will doubtless suggest both corrections of long-current erroneous readings and new interpretations of passages hitherto misunderstood. Indeed, the advancement of our critical knowledge of these ancient oracles will be perpetual, and we shall never arrive at absolutely definitive results. But this progress is slow, and there is no immediate prospect of such discoveries as will require great changes in our views of the character and interpretation of the Old Testament Scriptures. If we are to wait for a text unequivocally perfect, we shall wait for ever, and the expectation of more satisfactory readings is not a sufficient reason for delaying action, provided a revision is expedient on other grounds.

These observations apply with nearly equal force to the Greek text of the Apocrypha and the New Testament. Since the discovery of the Sinaitic manuscript, and since the jealousy of Rome has so far yielded as to make the Vatican Codex accessible to Biblical scholars, it may be assumed as probable that we are in possession of sufficient means for determining, with a close approximation to the truth, the genuine reading of all the books of the Christian Scriptures, or, in other words, of establishing a text which may be allowed to stand as the original for a period long enough to produce changes in the English language which shall require still another revision.

The first duty of the revisers, then, is to settle the text to be translated from, and the exegesis of that text. The establishment of the readings and the interpretation of the text are indeed distinct labors, but the qualifications required for the performance of them are so nearly identical that they may and should be entrusted, if not to the same individuals, at least to the same class of scholars. Besides the rare moral requisites of perfect candor, impartiality, and independence, the satisfactory discharge of the duty we are considering demands great knowledge of the theory of linguistics in the most advanced state of that science; thorough scholarship in the original languages of the Scriptures and in the cognate dialects; the most profound and comprehensive learning in the theology, the ritualism, the ethics, and the social life and institutions of the people of Palestine, and of the neighboring tribes with whom they had relations of blood or of commercial and political intercourse; and, finally, great experience and skill in *diplomatics*, or the deciphering of ancient manuscripts and the determination of their age and authenticity.

The term "diplomatics" is not so familiar to the readers of a country which possesses no old manuscripts as to render some explanation of its meaning superfluous. The diversities of ancient handwriting were as great as those of modern chirography. The characters employed by the copyists differed both from those of our ordinary letterpress and from the script-hand of our time, and hence long practice is required to be able to read any writing which is even a few centuries old. The scribes, too, habitually employed numerous contractions and shorthand forms, to save space and economize the costly material on which they wrote. Not only were inflexional terminations thus abbreviated, but common words and syllables of considerable length were often expressed by a mere flourish of the pen. Hence the grammatical construction, and, of course, the meaning, of a period may depend upon a dot or a mark so insignificant as to escape an untrained eye altogether. The deciphering of manuscripts thus written is a slow and laborious process, requiring a knowledge, an experience, and habits of patient investigation which can be acquired only at the expense of long years of study. Again, scribes are prone to mistakes in copying in all languages, especially in those with which they are not altogether familiar. In every language, there is a particular set of mistakes which is most likely to occur, and every copyist has his own special errors into which he is constantly running. It is difficult to give intelligible examples of such habitual errors in languages not known to ordinary readers; but we may illustrate what we mean by referring to the experience of every man who has given a few lessons in Latin. All blockheads will make the same blunders in construing their texts, and, besides this, every dullard will have habitual mistranslations of his own, so that a practised teacher can foretell, with almost infallible certainty, exactly how Master John or Master Peter will bungle a given passage in reciting his Virgil. The decipherers of an ancient manuscript must know what errors to expect in a Greek or Roman scribe, and of what transgressions of orthography and inflexion the particular copyist he is reading is most likely to be guilty.

But suppose the manuscript deciphered and copied, it becomes further necessary to determine its value as an authority. *Prima facie,* the oldest copies may be assumed to be the most accurate, as being nearest in time to the original. Most old manuscripts are without date or name of writer, and, as falsifications are frequent, these indications are in themselves of little value, even when they exist, and other tests must be resorted to. It is observed that not only has the handwriting of every nation a special character, but that its type changes from century to century, and hence, upon inspection of the chirography of an old writing, an accomplished diplomatist can say, with approximate certainty, This manuscript is the work of a scribe of such or such a nation, and it was written in such or such a century. But these are by no means the sole tests of age. The color, consistence, and chemical composition of the ink; the character of the lines, as indicating whether they were drawn with a reed or hair-pencil or a pen; the style of ornamentation of the capital letters; the justification—to use a printer's word—of the pages; the form and combination of the numerals, the quality of the parchment or paper, and many other material indications, must be taken into account in settling the age of the writing. And, besides all this, there are many points of internal evidence of a still subtler character which must be considered in determining the literary value of a given manuscript.

The labors thus far detailed are entirely irrespective of the language into which the translation is to be made, and, consequently, they would be precisely the same whether the proposed version were to be in German, in English, in Spanish, or in Hindustani. The nationality of the scholars charged with this duty is, therefore, wholly immaterial, and, from this and other considerations already stated, it is obvious that, other things being equal, there is no good reason why Jews as well as Christians, rabbis as well as bishops, should not have a voice in determining the reading of the Hebrew Scriptures, and why Germans, Russians, and Greeks, Biblical students, in short, of every tongue and of every creed not tied down by infallible decrees to the words of the Latin Vulgate, may not aid in settling the text of an authority regarded as paramount equally by all. In so great and so an important an undertaking, the soundest and largest living learning ought to be called into service; the best scholarship of Judaism and of Christendom employed in preparing what, for the time, may be regarded as an authoritative setting forth of a law recognized as binding, in its respective parts, Jew and Christian alike. It is perhaps needless to add that all, or even a majority, of the ablest Biblical orientalists are not of the English Church or of the English nation; and if it is true, as Blunt asserts, that "the venerable Pusey" is the "greatest Hebrew scholar and theologian" of England, it is quite certain that the highest order of sacred learning has no representatives in that country.

Doubtless, a proposal to defer to the opinions of German rationalists in deciding between any two different readings of the Hebrew and Christian Scriptures would be very repugnant to the prejudices and the feelings of many a devout believer; but though the arrogant dogmatism of German learning is often highly offensive to the self-respect of scholars of other nations, yet no fair-minded and competent judge will contend that German historical and critical investigators are inferior to those of England in acumen, in soundness of judgment, in honesty, or in impartiality. To reject such helpers, therefore, altogether, or even to refuse them an equal authority in the preliminary and fundamental process, would be an exhibition of a narrow and selfish prejudice, or a weakness discreditable to the guardians of a religion which, rightly understood, forbids us to love the church better than Christianity, or Christianity itself better than the truth.

G. P. M.

THE MILITARY RESOURCES OF PRUSSIA AND FRANCE.*

THE overwhelming success of Prussia has clearly shown that armies organized upon the same basis as are those of every civilized state, except North Germany and Switzerland, are nothing more than historical curiosities. They are in the same relations to the army which is to-day the first in the world as bows and arrows and battle-axes are to Gatling guns and breech-loaders. The strenuous efforts of Cæsarism to place an impassable barrier between the soldier and the citizen are now rendered for ever impracticable. The two have become homogeneous, and the wars of the future are to be waged, not by the "dregs of the population," as in the cases of the Crimean and Italian campaigns, but by armed nations.

Although it might seem at first sight suggestive of a return to the age of the invasions of the Northmen, Goths, and Huns, yet it is purely in the interests of civilization that, from the first sure sign of hostilities until the close of the war, the wheels of progress should cease turning, and the whole civil machinery of the state come to a dead stop, so that the untrammelled resources of the entire nation may be directed to the extirpation of the evil. What torrents of precious blood, shed on modern battle-fields, would have been spared, had war always been ushered in with this civil stagnation, and rendered nations fully alive to the awful scourge they were inviting. If that Utopia of everlasting peace, so much talked about, were ever really in store for us, it would originate from the future impossibility of checking, even momentarily, the increasing civil industry and advancement.

Prussia to-day counts among her soldiers nearly all of her leading men in every walk of life, whether statesmen, financiers, men of science, or scholars. Her laws compel every subject, from her premier down to the meanest inhabitant, to defend his home. The life of a Prussian soldier is of infinitely greater value to his country than that of a French soldier to his. The former is a fair representative of the intelligence and morality which the superior educational system has fostered, while the troops which Louis Napoleon put in the field had few feelings in common with other Frenchmen, although endowed with the dashing and magnificent courage which is this great military nation's birthright. The high tone of the Prussian private makes it imperative for his officer to possess the advantages of at least an equal general education; hence, besides the purely military examinations, each officer has to undergo perpetual tests as to his general culture; and no pains and expense are spared to render him in every way worthy of the confidence and obedience of the precious material which the nation places in his hands. The French officer, on the contrary, is fortunate if he has even a technical education, in the narrowest sense of the term. Instances, indeed, have been cited of French officers who could not even write their own names; the prevalence of such men has not only prevented the officer's uniform from being a passport to good society, as it is in Prussia, but has brought it into such disrepute that the better class of officers are forced to lay aside their badges of authority before being received socially.

This want of sympathy between the army of the late Empire and the educated classes explains the readiness which not only the journalists but also the people have shown to sacrifice their armies for trifling ends. The wild cries, however, of the former for blood-letting of any kind at any price signify nothing; for if these fire-eaters had, like their milder contemporaries, in common with all citizens throughout the Fatherland, been forced to bear arms, France would have reaped some of the advantages to be derived from the policy of placing the directors of a railroad company upon the cow-catcher.

Publications of military men, inspired by a love for and a desire to further the interests of the profession—and there is nothing else to induce one to undertake a work of the sort—find, as a rule, but very few readers, even among army officers. The knowledge of this afforded some relief to the First Napoleon when he first saw in print the "Treatise on Grand Military Operations" written by Jomini, then a "chef d'escadron;" for, after venting his rage upon his ministers for ever allowing to be published a book which reduced all the principles of war to formulæ, he after some reflection exclaimed: "But I attach too much importance to this publication. The old generals who command against me will never read it, and the few young ones who will read it have no command." We trust, however, that the opportune appearance of the book before us will ensure for it a more cordial reception than is usually accorded to such works. The "Recent Changes in the Art of War" is the first of the four essays composing the volume, which were collected and republished from the numbers of the *Edinburgh Review* between the years 1864 and 1867. In this essay Colonel Chesney shows us that the fundamental principles of the science of war have been, and always will be, the same for all ages. Like all general truths, they are imperishable; and to them are due the victories of Issus, Arbela, and Pharsalia, no less than those of Austerlitz, Jena, and Königgrätz. The increased civilization, advances in science, greater wealth, and the now general use of steam, have rendered the problem more complicated and difficult, but its effects, when once solved, will be more striking. The sphere of application of the principles of the science has been vastly enlarged, and the writer tells us that "strategy will become bolder and more decisive as it will also make larger demands upon the intellect of the chief," and will "increase the advantage which superiority of conception has always claimed." But there is nothing more satisfactory in the whole volume than the justice, so long withheld, which the Archduke Charles receives at the hands of Colonel Chesney. This generally underrated captain, although shackled by the jealousy of his Imperial relatives, the impertinent interference of the war ministry, and the meddling arrogance of the Aulic Council, yet achieved success which, considering all the circumstances, evinced military talents equal to those of his autocratic rival. When, in the early part of his career, the Archduke had driven across the Rhine the French armies led by Moreau and Jourdan, generals second only to Napoleon and himself, he submitted to the numerous dead-weights who hung about his neck a plan for the "transfer of his victorious army direct across the Alps into Napoleon's rear in Lombardy." Of this proposal Colonel Chesney truly remarks: "There has been no bolder device in strategy at any time, and its audacity probably caused its rejection at Vienna, for the Emperor had not yet been taught to be jealous of his brother's fame. But history might have had to write the events that followed with another pen had this design been carried out with as much spirit as the German campaign." For further information upon this subject, however, we must refer our reader to the volume itself.

In an essay on the "Military Growth of Prussia," Colonel Chesney portrays in vivid colors the rapid and brilliant career of this wonderful nation from the time when it was a mere "Sclavic (?) country occupied by a garrison of Teuton colonists" until it became the core around which is to gather a united Germany. As this rise is owing to circumstances essentially military, we have in this chapter a valuable summary of Prussian history from the birth of the kingdom to the Treaty of Prague. The ruin of the French armies to-day is directly traceable to the consequences of the Treaty of Tilsit; since that time, in all that goes to make a nation powerful, France has receded in about the same proportion as Prussia has advanced. The condition of the Prussian army seventy years ago was somewhat similar to that of the French at the outbreak of the present war. Relying entirely on the glories of the past, Prussia deemed herself invincible, while bribery and corruption undermined her military organization and sapped her vitality. Her army was commanded either by the youthful and inexperienced scions of reigning princelings whom the king wished to conciliate, or by imbecile old fossils, whose only merit consisted in having outlived the great Frederic; while the scum of the floating population of the globe was all that could be raked together to endure the inhuman severity of the Prussian officers; thus furnishing soldiers, who preserved an outside semblance to the battalions of Frederic by carefully treasuring up all their vices and as diligently ejecting all their virtues, and who, if they fought bravely, only did so for the same reason to which one of our most distinguished generals used to attribute the daring courage of the regiment which he once commanded, saying, "My men fought well, for they knew they would rather be in hell than in my regiment." The healthful lesson of Jena and Auerstädt, however, brought to light this corruption, and changed the "servile worship of Prussian models, which had prevailed through the armies of Europe, into a contempt as ill founded as the opposite extreme." In 1807, her entire political system underwent a renovation, and under the wise direction of Stein and Scharnhorst were sown the seeds of that military organization among the early fruits of which are Königgrätz and Sedan and the assumption of the former imperial claims of Austria.

---

* "The Military Resources of Prussia and France, and Recent Changes in the Art of War. By Lieutenant-Colonel Chesney, Royal Engineers, and Henry Reeve, Esq., D.C.L. Reprinted from the *Edinburgh Review*." London: Longmans & Co. 1870.

In an essay upon the "Military Institutions of France," Mr. Reeve points out the significant fact that, if "the constable's sword and marshal's staff in modern France were in the hands best able to wield those symbols of military authority, the three distinguished officers" (meaning the Duc d'Aumale and Generals Trochu and Changarnier) "would probably not have employed the pen to place their experience and judgment at the service of their country." Under this heading we have an historical narrative of the administration of the regular army of France from its first systematic organization under Louvois, seconded by the valuable assistance of that rigid disciplinarian Colonel Martinet (who has bequeathed his name to our language), down to the close of Marshal Vaillant's administration. Louvois, Carnot, and Niel are the three ablest war-ministers in French history; the military glory of Louis XIV. was due to Louvois much more than to Turenne and Luxembourg, who only used with fair dexterity the effective instrument which the genius of the minister had created. The army, as organized by Louvois, greatly deteriorated after his death, until it was at last entirely swept away by the great storm of 1789. The wonderfully prompt and systematic organization of the "*levée en masse*" decreed by the Convention will always be of great interest to the military student. It is to the lasting merits of Carnot that he created those armies of the Republic who "followed Jourdan and Moreau to the frontiers of Bohemia," and invented the system by means of which Napoleon was afterwards able to keep himself supplied with the enormous amount of material which he consumed; for it is a singular fact that the "greatest master of the art of modern warfare did nothing to improve the organic constitution of his army." Marshal Niel's administration was signalized by a new law for the organization of the army in 1868, which Mr. Reeve publishes in an appendix. The sudden collapse of France proves nothing against this system, which has not had time enough to work smoothly, even if it had been put fairly into execution. Its efficiency was undermined by the swindling process of allowing recruits to be represented by bank-notes to fill the mouths of the hungry parasites of Imperialism, and by the general rottenness of the Second Empire. It is claimed that the Marshal's plan embodies the essential merits of the Landwehr organization, of which it is a modification, without imposing upon the people the same restraints and rigid exactions. At the time of the Luxemburg war-cloud, the Emperor's manifest desire to bring on hostilities was frustrated by the knowledge of the simple fact that, using his greatest efforts, he could have put in the field only 150,000 men, poorly equipped and destitute of a proper commissariat, to oppose the 800,000 Prussians, most of whom had but a few months back marched from one of the most complete victories of modern times to within striking distance of the French frontier. It now appears that, had the late Marshal's plan been carried out in good faith, France would have had under her colors a million and a half of men, fully provided with the appliances of modern science, in room of the 350,000 who could with difficulty answer to her summons in her hour of trial.

Other things approximating to equality, victory in the end is but a question in arithmetic. France, with a somewhat smaller population than her adversary—one which does not increase at all when the annual conscription is 100,000, and which perceptibly diminishes when the conscription is 140,000, and out of which in a given year only 132,000 men fit to bear arms ever reach their twentieth year—would have had to furnish at least 500,000 recruits annually to keep such an enormous army upon an effective footing. However skilfully the resources of France might have been used, they would have proved impotent to prevent German unity. Had Louis Napoleon's dream of entering Berlin in triumph been realized, the fated event would only have been delayed. Instead of looking upon the German Empire as an insupportable evil, Frenchmen should cordially greet it, and regard it as the greatest blessing which can befall them (and here we are at issue with Mr. Reeve, who attributes the insecurity of peace since the Treaty of Prague to Prussian moves for the achievement of this unification, and insists that, if effected, it would be "more dangerous to France than to any other power"). The Germany of yesterday, between Prussia and Austria, which Dr. Strauss compares to a "carriage with horses harnessed at both ends and pulling opposite ways," will always be a lasting danger to France, and will always force her to endure the ruinous evils resulting from the maintenance of a large standing army. This state of things, according to the Comte de Paris, no mean authority, keeps upon the frontiers of France two powers, each of which is ever ready to compromise her with their difficulties, only to soon desert her, and to end by uniting against her, for fear lest the one might seem less German than its rival. The natural consolidation of the Teutonic races gives an earnest of future peace and prosperity which alone can turn the energies of France into their proper channels, allow her population to recover from the effects of the wars of the First Empire, and eradicate from her system the intermittent fever to which she has been subject since the Revolution. The Germany which is now forming, although possessing greater military resources than France, yet will be less aggressive, for her peace will be in the hands of those to whom, most bitterly of all, would the horrors of war come home.

The remaining essay, upon the "Rifled Ordnance of England and France," widely differs from the other three, inasmuch as it is too abstract to interest the general reader, while it is of but little worth to the military student, for, as the author says, it is compiled from sources printed seven years ago.

Taken as a whole, however, the useful information and original thought contained in the book, aside from the terseness and perspicuity of the style, so fitting to the subject, are such as to earn for it a high place in military literature.

THE CROMWELLIAN SETTLEMENT OF IRELAND.[*]

THIS book, of which we are glad to welcome a second and enlarged edition, tells one of the strangest stories in all history, and, when we say that it accounts for the present condition of Ireland with a clearness displayed by no other work, it is the same as saying that it throws light on one of the darkest and most serious problems of modern society, for the condition of Ireland is actually putting in peril at this moment the dearest interests of both England and America. The "curse of Cromwell," in short, has lighted on and followed over the earth not only the Celts whom he sought to extirpate, but the Anglo-Saxons whom he sought to serve.

Mr. Prendergast was five years ago appointed, with Dr. Russell, the President of Maynooth College, on a commission to examine the great body of historical papers known as the Carte Collection, and deposited in the Bodleian Library, Oxford. The Carte Collection contains the Ormonde Papers, or letters and documents, public and private, connected with the government of Ireland during the Duke of Ormonde's connection with it, from 1641 down to his death in 1688, with the exception of ten years, from 1650 to 1660, passed in exile with the king. From the Restoration until his death, Ormonde was in effect Lord-Lieutenant of Ireland, and was the recipient of all the petitions, plaints, and remonstrances presented by those whom the wars, confiscations, and settlements of the Commonwealth had wronged. With the aid of this collection, and of various family papers never before examined, Mr. Prendergast has been able to set before us, with curious and instructive minuteness, the real nature and results of the great social and political revolution known as the Cromwellian settlement of Ireland.

---

[*] "The Cromwellian Settlement of Ireland. By John Prendergast, Barrister-at Law." Second edition, enlarged. London: Longmans. 1870.

The war in Ireland, begun by Cromwell in 1649, was ended in 1653. The Irish were put down much as the Indians on the Western plains are now put down, by wholesale massacre and by the destruction of their crops and cattle. During the last two years, their resistance consisted simply of guerilla warfare, in which, owing to the nature of the country, they were very successful, and to put an end to it the parliamentary army under Ireton laid everything waste. In his march of 150 miles from Limerick to Waterford, he passed through fertile districts of thirty miles together in which not a house or living creature was to be seen. When "peace" came in 1657, special licenses were issued by government to kill and dress sheep and lambs. There is one on record which permits the Widow Bulkeley, in consideration of her "ould age and weakness of body, to kill and dress as much lamb as should be necessary for her own use and eating, not exceeding three lambs for a whole year." The last organized force of the Irish had surrendered the previous year, and now came the plan of pacification. The pay of the English army was heavily in arrears, and it was resolved to satisfy the claims of both officers and men by grants of land to be taken from the Irish. The officers were very eager for this arrangement, as they wished to found families—the men less so, but it was the best they could do; so they accepted.

The first thing to be done was to get rid of as many of the Irish as possible. Accordingly, the men were encouraged in every way to enter the service of Continental powers, and in the years 1651–54 34,000 embarked for Poland, France, and Spain, few or none of whom ever returned. Large numbers of the gentry at the same time emigrated voluntarily, whose descendants are still found in the O'Donnells and O'Reillys, and others, of Spain and Austria; and the MacMahons, Dillons, Reillés, Niels, and Cavaignacs (Kavanagh) of France. Orders were then issued by the Commissioners of Ireland to governors of garrisons, and keepers of jails, and masters of workhouses, and all other persons in authority, to deliver to agents of Bristol sugar merchants all able-bodied men in their charge, "marriageable women and not past breeding," and all persons without visible means of livelihood—in the then state of the country an enormous multitude—for transportation to the West Indies, to be employed in forced labor on the plantations. Many found their way, under similar contracts, to New England. Mr. Prendergast gives the names of the agents, and merchants, and dates of some of the largest contracts. Under this system, in the course of four years, 64,000 Irish men, women, boys, and girls were sent into slavery, and many of the women belonged to families of the better class whom the war had left destitute. In March, 1655, the order was revoked, and the trade ceased. In 1655, however, Jamaica having been conquered, and colonists and a garrison being wanted for it, Cromwell engaged 1,500 men of the English troops in Ireland to go there to settle, and ordered "1,000 Irish wenches" to be sent with them. Henry Cromwell, then commanding the forces in Ireland, answered that he would have to take the "wenches" by force, and suggested that from 1,500 to 2,000 boys, from twelve to fourteen years of age, should be sent out also. One thousand of each were accordingly sent, with the pious hope that they would be made "Christians" of in Jamaica.

In the meantime, the process of dividing the lands was going on actively. There was due to the "Society of Adventurers," or persons who had lent money to the government for the expenses of the war in Ireland, a sum of £360,000. This was paid off by liberal grants of land, drawn by lot at a public lottery held at the Grocers' Hall, in London, in July, 1653, in ten counties. *The whole of the rest of Ireland*—except the province of Connaught—was set apart for the payment of £1,550,000, due as arrears to the officers and soldiers, and of £1,750,000 of floating debt, incurred by the government for supplies furnished during the war. On the 26th of September, 1653, all ancient estates and farms of the people of Ireland were declared to belong to the Adventurers and Army of England, and all Irish were ordered to "transplant" to Connaught—a howling wilderness of bog and rock—with their families, before the first of May following, on pain of death if found east of the Shannon after that date, the trial to be by military commission.

The exceptions to this rule were the Irish wives of English Protestants embracing their husbands' faith; boys and girls, under fourteen, in the service of Protestants, and Irish Catholics who could offer satisfactory proof of having shown "Constant Good Affection" to the Parliament as against the king during the previous ten years. The decree was an awful one, and it struck the unhappy people just as they were gathering in their harvest, and this the first tolerable harvest they had had since the war began. "Constant Good Affection" was almost impossible to prove, for mere passiveness would not support the plea. Moreover, the order covered not only the "Irish enemy," but the descendants of the English settlers of the Elizabethan period—men English in blood and speech and manners, the Comynses, Stackpoles, Morrises, Hamiltons, Fitzgeralds, Butlers, Plunkets, Cheevers, Barnewalls, Talbots, Archers, and Atkinsons, just as much as the Tooles, Donohoes, Mores, Kavanaghs, and Keoghs. It was just as hard for the one as the other to prove "Constant Good Affection," and their land was just as valuable. Among these unfortunates was William Spenser, the grandson of the author of the "Faerie Queene." Edmund, who was "the first settler," when he took his confiscated land, was as hard on "the mere Irish" as any of the Elizabethan troopers. And now the grandson was ordered to quit his pleasant home and his lands in the county of Cork in midwinter, and move into Connaught as an "Irish Papist." He appealed to Cromwell, who wrote to the Commissioners begging that he might be spared, but in vain. Mr. Prendergast reproduces the Protector's letter, and it is worth quoting:

"*Lord Protector to Commissioners for Affairs in Ireland.*

"WHITEHALL, March 27, 1657.

"RIGHT TRUSTY AND WELL BELOVED:

"A petition hath been exhibited unto us by William Spenser, setting forth that, being but seaven years old att the beginning of the rebellion in Ireland, hee repaired, with his mother, to the Citty of Corke, and during the rebellion continued in the English quarters; that he never bore arms or acted against ye Commonwealth of England; that his grandfather, Edmund Spenser, and his father were both Protestants, from whom an estate in lands in the barony of Fermoy and county of Corke descended to him, which during the rebellion yielded nothing towards his reliefe; that ye estate hath been lately given to the souldiers in satisfaction of their arrears, upon accompt of his professing the Popish religion, which since his coming to years of discretion hee hath, as hee professes, utterly renounced; that his grandfather was that Edmund Spenser who by his writings touching the reduction of ye Irish to civility brought on him the odium of that nation, and for those works and his other good services Queen Elizabeth conferred on him yt estate which the said William Spenser now claims. Wee have also been informed that ye gentleman is of a civil conversation, and that the extremities his wants have brought him unto have not prevailed over him to put him upon indiscreet or evil practices for a livelihood. And if upon enquiry you shall find his case to be such, wee judge it just and reasonable, and do therefore desire and authorise you yt hee bee forthwith restored to his estate, and that reprisall lands bee given to the souldiers elsewhere. In ye doing whereof our satisfaction will be the greater by the continuation of that estate to ye issue of his grandfather, for whose eminent deserts and services to ye Commonwealth yt estate was first given to him.

"We rest, your loving friend,

"OLIVER, P."

The work before them was so horrible—the prayers and entreaties of the aged and tenderly bred women, many of them wearers of ancient titles, of war-worn men, young children, of the sick and infirm, that they might not be cast out of their homes in midwinter to perish miserably in the waste, were so piercing—that the Commissioners wrote a circular letter to the commanding officers, calling for a general fast and a general "lifting up of prayers, with strong crying and tears to Him to whom nothing is too hard, that his servants, whom he had called forth in this day to act in these great transactions, might be made faithful, and carried on by his own outstretched arm against all opposition and difficulty to do what was pleasing in his sight." So the Lord strengthened them, and they pushed on the work. Mr. Prendergast cites a great many of the certificates given to the poor victims on their departure. They all contain personal descriptions of the holders and the members of their families, and one can hardly read them, even through the mists of two centuries, without feeling some of the pang of those dreadful days.

After a year's trial, it was found impossible to make all the Irish go, so in 1654 a dispensation was issued in favor of "the sick, aged, lame, and impotent," those who had aided or sheltered English soldiers, and who should manifest a desire to turn Protestants. But the work went on very slowly still; the Commissioners were loth to hang the recusants—although they did it in some cases—and an immense force would have been required to carry it out by means of arrest and transportation; so they tarried and granted indulgence; the troops all the while clamoring for their lands and reproaching the Commissioners with their slothfulness in the execution of the Lord's will. At last, however, the work was accomplished satisfactorily. The bulk of the Irish from all districts, the land of which was needed, were caged up in Connaught. The old homes of the landed proprietors were taken possession of by the English officers;

the privates settled down under them as tenants, somewhat discontentedly, for Ireland contained neither beer nor cheese, horses nor ploughs, nor Englishwomen. This last want was the worst of all, for love-making to Irish women, whom the troops found very attractive, was strictly prohibited by "the third article of warre," and offenders, as the records of courts-martial still extant show, were severely flogged for it. Other heavy penalties were inflicted on soldiers marrying Irishwomen. Ireton, by a general order, forbade any officer or soldier marrying an Irishwoman, whether calling herself a Papist or not, "until it had been ascertained by an examination (by fitt persons, such as shall be appointed for that end) whether the change of religion flowed from a reall worke of God upon their hearts," or "from corrupt and carnal ends."

The intermarrying, however, went on to a greater or less extent, human nature being stronger than general orders. Some of the transplanted crept back and died within sight of their old seats; others came back and rented farms from their conquerors; others ended their days in Connaught; others again of the younger men stole home and "bushwhacked" the Englishmen, thus beginning the practice of assassination about land which "Rogues and Rapparees," "Whiteboys," "Captain Rocks," and "Molly Maguires" have kept up down to our own day. Thousands in the next generation flew to arms joyfully thirty years later, under James. During the century following the Boyne, 400,000 Irishmen died in foreign service, and the rest remained at home to hate and curse their conquerors. In short, if we judge this settlement, on which the Lord's blessing was invoked so often, by its consequences, work so devilish by Christian people was never done.

RECENT REPORTS ON EUROPEAN EDUCATION.

THE reports of the United States Commissioners to the Paris Exhibition of 1867 are now before the public, having been edited under the auspices of the State Department at Washington, by Professor William P. Blake. Although the several volumes differ widely in merit, the series, as a whole, is very useful, and some of the reports—for example, that on machinery, by Dr. Barnard, of Columbia College—are of uncommon merit.

One of the last to be published is the Report on Education, by Mr. John W. Hoyt, a professor, if we have been rightly informed, in the State Agricultural College of Michigan. It is a closely-printed volume of four hundred octavo pages, and is not at all restricted, as one might suppose, to what was taught in the Exhibition, but is a general compendium on the subject of European and American education. The report is divided into five sections, the first of which is a rapid review of the present condition of the various civilized countries in respect to public instruction; the second part is devoted to "Popular Education," both primary and secondary; the third is headed, "Superior General Education;" the fourth, "Special Education;" and the fifth, "University Education." We are not sure that these headings are wisely chosen, or that the author himself has a clear notion of the distinction between the specialties involved in "university education" and those in "special education" and "superior general education." However this may be, by far the largest portion of the report is devoted to the various establishments for training young men for the higher callings and professions of life. Two-thirds of the report we roughly judge to be thus taken up.

The spirit which has animated the author of this volume is so obviously on the side of liberal, superior, and comprehensive systems of training, and he has taken so much pains to bring together a vast array of facts, that we are reluctant to express our estimate of his work; but in truth, there is so little in it besides the accumulation of items of information, so little of digestion and arrangement, so little of personal observation or discriminating comment, that his labor seems to us almost thrown away. Such particulars as can be gathered by the translation and transcription of programmes and catalogues are abundantly given; such as can only be obtained from familiarity with the workings of the institutions described, or from personal intercourse with the authorities of them, are almost wholly wanting. Even in this country the author places on one plane three schools of science as unlike as the Lawrence, the Sheffield, and the Chandler (the last of which, by the way, is attributed to Brown University instead of to Dartmouth College). Everywhere Mr. Hoyt appears to be fettered by names, instead of being free to estimate the characters of the establishments he refers to. Thus it happens that the great school of mathematical science, the *École Polytechnique*, is described in connection with the German polytechnicums, because of the nominal similarity, though the writer is well aware of and, in fact, alludes to the actual difference. This lack of study of the real peculiarities of the schools described leads to other queer mixtures, schools of science, schools of applied science, and advanced polytechnic schools being treated under as many different chapters. When we add that this confused accumulation of statistical data is set forth without any index, and with a very meagre and unsatisfactory table of contents, we have said enough to show that the volume can be of very little practical value in enlightening the teachers of this country. When we compare this report with the unofficial work of Mr. J. Scott Russell on "Technical Education," we see the difference between a mechanical, statistical agglomeration of programmes and the live, eloquent, and suggestive handling of a great theme.

It is understood that the late United States Commissioner of Education, Hon. H. Barnard, has also prepared a large volume on the same general theme as Mr. Hoyt's, but that its publication is temporarily delayed for the want of a Congressional appropriation. We hope it will soon see the light.

Three other national reports on education lie before us. One of these is the report of the Austrian Commissioners at the Paris Exhibition. This is almost exclusively devoted to critical comments on such matters as were brought together at that great display. Inspector Prausek discusses furniture, apparatus, and books for primary public schools; Inspector Pátek discusses normal schools; Dr. Korn Luber, secondary and trade schools; and Professor Niemtschik, drawing in schools. By confining each writer to the lessons of the exhibition, a great many minutiæ are brought out, especially in regard to obscure publications and those which do not come into the book-trade, and teachers in the higher schools of this country may find many valuable hints in respect to material for aid in instruction crowded into these pages.

The thirteenth volume of the Jury Reports on the French Exhibition, published under the direction of M. Chevalier, is devoted to the subject of education. The topics successively discussed are nurseries (*crèches*), primary school and elementary instruction, instruction of the blind and deaf mute, adult schools, special secondary instruction, polytechnic schools, instruction in music, drawing, geography, technical instruction (for agriculture, manufactures, the sea, and for business), colportage, and libraries Of these various discussions, the two by M. Pompée, on "Polytechnic Schools and Technical Training," are the most extended and complete. They are particularly valuable in all that pertains to the measures adopted in France during the last half-century, though their value is not confined to that country. This portion of the jury report will well repay examination by those who are interested in scientific and technical training in this country.

The other work to which we have made allusion is a report by M. Hippeau, of the Ministry of Public Instruction in France, on his observations in this country. It is a work in which compliments and blunders are so curiously interspersed as to be truly laughable. By the side of Rev. James Fraser's report to the British Commissioners, it is not of any value.

MÜLLER ON THE SCIENCE OF RELIGION.

SOME time during last winter or spring a brief course of four lectures was given at the Royal Institution in London, by Prof. Max Müller, on the Science of Religion. They were reprinted in the newspapers of the day, and then printed in full in one of the English magazines; and they have been reprinted in *Littell* (the numbers for August), so that they are fairly before the American public also. It is safe to presume that they will yet appear collected in a volume; meanwhile, it may not be amiss to glance at their contents, and to estimate the value of the contribution they furnish to the thought and knowledge of the day.

The author brought himself prominently forward as a worker in this department by his volumes of "Chips," of which the first was styled (by rather a misnomer) "Essays on the Science of Religion." Both volumes contained an abundance of valuable material for the knowledge of various religions and systems of mythology, set forth in the peculiarly attractive manner which is characteristic of Müller. His preface was really an essay on the science of religion, and sketched his idea of what the science should be, how prepared for, and in what frame of mind and to what ends studied; and it is, although in some points open to criticism, in the main an eloquent and powerful exposition, conceived in an excellent spirit, and calculated to do much good. The present lectures, now, are chiefly an expansion of that preface, along with an epitome of part of the information as to particular religions contained in the volumes. And, on the whole, the later production can hardly be regarded as an advance upon the earlier; the lectures do not show any noteworthy progress in the author's mind toward more clear and definite views; they do not advance the plan and groundwork of the new science; and in point of style and interest of presentation they fall short of his usual standard. They have the aspect of being written in response to an outward call rather than from an inward impulse; they are a beating-out of materials already worked up and made public.

The term "science of religion" has a sinister sound in many ears for reasons of religion, and an equivocal sound in many others for reasons of science. To the one party, the submission of their own sacred faith, along with the other creeds of the earth, high and low, more or less false and degraded, to a so called scientific scrutiny, cold-blooded and irreverent, is repulsive; to the other, a "science" of human opinions and conclusions on subjects styled religious does not seem precisely practicable of construction. Müller might have done well to use some less pretentious title, at least until there should be more of a science to which to apply it. There is no reason for haste; men did not talk of a science of language until a vast deal of work had been done in it, with very definite aims, by very exact methods, and with very wide-reaching and important results. Müller is quite too ready to parallelize the developed science (of language), and the projected science (of religion), to constitute the latter after the model of the former, and to establish an identity of method between the two. They are very far from presenting that close and essential analogy which he would fain recognize. There is a peculiar objectiveness, a tangibility, about the uttered signs of thought; they have a history of their own, aside from the thoughts which they signify, which makes them admit a precise scientific handling, like so many physical facts. A science of religion is more like what a science of human conceptions and ideas would be. Myths and ceremonies, which are in a manner the outward embodiments of religious ideas, are far more closely analogous with speech. There is nothing in doctrines and creeds which should make them the subjects of that special "comparative" treatment which has been found so effective with words, and which Müller wants to transfer bodily to his new subject. To justify this, it is not enough that we require to compare religion with religion in order to understand both; everything that we wish to understand needs to be compared with its like; all study is comparative in that sense. Nor are all these questionable claims essential to Müller's main purpose. He would, we presume, be content to insist merely that religions be studied on the widest foundation of knowledge that the latest researches into human history and human nature render accessible, and with a true scientific spirit—a spirit resolute to see all that is fairly to be seen there, and only that. Whether this will lead to anything worth calling a science we may consent to leave to the future to determine; at any rate, it will lead to something true and valuable.

Now, the one all-important truth, without a recognition of which there can be no foundation for a scientific or fruitful study of religions, is, in our view, this: that the early religious beliefs of every race arise out of the unaided attempts of that race to explain to itself the problem of the universe, as we may call it, or the mystery of man's existence, surroundings, and destiny. Every human being finds himself placed in the midst of evident forces which are infinitely more powerful than he, and indefinitely varied in their manifestations, and whose action, which he cannot control, is now helpful and now hurtful to him; his own birth and death are inexplicable phenomena; the influences, in himself and others, which make for his happiness or unhappiness, he does not comprehend; his longings and his fears seek a support outside himself; his consciousness of good or evil desert puts itself in relation with those awful powers which govern the whole of nature. No race of men—if sufficiently gifted and sufficiently developed to have a sense for all this, or to be otherwise affected than struck dumb with stupid wonder at it—could possibly help reasoning upon it, and deriving views, and theories, and beliefs, and framing sets of acts and ceremonies expressing them; and these, in all their variety, depending upon the various endowments and circumstances of the different peoples, are their religions. The assumption of a primitive revelation, of which such religions should be corruptions, is wholly uncalled for; given men as they are, and religions like those which now exist must and would have grown up: why, then, seek another explanation of their origin? Any other, indeed, is every day more clearly seen to be inadmissible, as out of harmony with the new knowledge respecting the history of the earth and of man which is rapidly winning universal currency and acceptance. Equally inadmissible, we would add, is the assumption of a native and absolute intuition of the Infinite, or the Divine, or of a God—which Müller would make the basis of the science he is trying to construct. It is sheer folly to talk of a sense of dependence, a yearning after a Father, and the like, as felt by the generations who laid the foundations of race-religions; it is a palpable importation of ideas of culture and refinement into rude and uncultured conditions. And Müller's theory of the growth of polytheism is, to our mind, altogether perverse. He imagines a recognition of the great Author of the universe, but at the same time a perplexity as to how he should be entitled, and a consequent resort to this, that, and the other grand natural object—for example, the sky and the sun—for names to give him; and then a blind forgetfulness that these had been adopted as names merely, and a transfer to the objects which they directly designate of the worship really meant for God. That is to say, men were cheated out of their original intuition by the jugglery of the words they had formed to express it. Whereas, polytheism is not less clearly, on theoretic and *à priori* grounds, the necessary antecedent of monotheism, than, by the evidence of history, its actual antecedent; the variety of manifestation of the superhuman forces leads the first simple observers and crude generalizers to assume a variety of causes; the recognition of their unity is a fruit of longer experience and wiser deduction.

The fundamental view which we have laid down being accepted, the true method of investigation is an obvious corollary to it; the religion of each race must be studied as a whole, and in its historical development. Each is the result of long growth, a structure built upon by generation after generation, one working over, modifying, and adding to what was bequeathed it by another. This being so, those grand, continuous communities, whether pure races or not, which by a similar process have formed families of connected languages, will have formed connected religions also—religions more or less alike, and yet diverse, like their dialects. This is the simple ground of that parallelism between religion and language which in his third lecture Müller misunderstands and distorts so strangely. Instead of joint results of ethnic unity, twin institutions handed down within the limits of each race, and growing and developing with its growth and development, he makes them the causes of nationality, and dependent each in turn upon the other. It might not be easy to find a more striking example of unclear perception and unsound reasoning than Müller exhibits in this lecture; and the views he puts forth as to the nature and history of language—especially as to its originally wild and chaotic condition, and its concentration into families of related speech by an unnatural and exceptional process originating in the spontaneous act of certain remote generations—are unintelligible and indefensible, wholly at variance with his own soundest teachings hitherto, and subversive of the science of language which he claims to have done so much to establish.

In criticising and setting aside certain superficial classifications of religions (which were hardly worth so much attention, since they would disappear of themselves in presence of a right method), Müller has forgotten to notice the most important distinction of all—that between race-religions, which have grown up by the gradual accumulation of beliefs and practices in a whole community, innumerable individuals having borne a part in their formation, and, on the other hand, individual religions, products each of the deeper insight and uncompromising independence of some one person, who breaks the shackles of traditional faith and practice, clears away narrow superstitions and effete ceremonies, and founds upon a new basis of perceived truth a new system. Religions of the latter class, of course, can arise only in later times, and can succeed in establishing themselves only where the forms of the old religion have become hollow, and no longer faithfully represent the better insight of the times. They, too, are alone capable of extension and transfer from one race to another; for, though they have their roots in the whole body of the national faith, and for their comprehension need the most careful study of the latter, they also in a degree cut loose from it, and plant themselves upon grounds which other races can appreciate and accept.

The spirit in which the study of religions is to be followed is equally evident from the views we have taken; it is the spirit of liberal and tolerant enquiry, of interest, of consideration and respect; often, perhaps, of pity and sorrow, but without intermixture of holy horror at the depths of human depravity displayed. If human nature has proved itself, on the whole, so weak and short-sighted, so selfish and impure, as to have gained only faint glimpses of truth, and to have clothed them in wild and abhorrent forms, it is very sad; and we ought to be the more grateful for the light which we enjoy, and by which, in the same weakness of human nature, we walk so fitfully and unfaithfully. All the higher and better religions of the world confess this weakness, for they all claim to found themselves on a revelation; that is to say, they imply the impotence of man, without supernatural aid, to understand whence he comes, how he is to live, and what is to be his end. And a hearty charity and kindly comparison should be among the most trustworthy and valuable signs of a true illumination from above.

We look for valuable results from Professor Müller's lectures, in the directing of attention to the study of religions, and we expect from his scholarship and liberality of spirit important additions to our knowledge of religions; but we are not disposed to accept him as the founder of a new science.

The Living World: containing Descriptions of the several Races of Men, and all Species of Animals, Birds, Fishes, Insects, etc., etc. With numerous anecdotes illustrative of their Instincts, Reasoning Powers, and Domestic Habits. By Augustus C. L. Arnold, LL.D., assisted by Edward A. Samuels, Esq. (Boston: Samuel Walker & Co. 1870.)—It has become almost proverbial that the compilation of works in science is most frequently undertaken by those who are least qualified for the task; but the truth of the assertion has rarely been so fully manifested as in this "Living World." On the title-page the long series of errors commences with the announcement that the work contains descriptions of "all species of animals"—a thousandth part, more or less, of the whole number of species of animals getting "descriptions"—descriptions the like of which may we henceforth be defended from. The errors thus beginning flow in a constant stream. We subjoin a few specimens of them: In the concluding remarks of the introduction, it is asserted that the animals described "are arranged and considered in this work according to the system of Cuvier, modified slightly, following the suggestions of Professor Owen, and more especially of Professor Louis Agassiz, of Harvard University." These are very high authorities, and the statement made would impress the general reader with the belief that a work so digested must be trustworthy. We have, however, found in it no evidence of any essential modification of the system of Cuvier—at least of none derived from Owen or Agassiz. It is true that the classification of Cuvier has been followed in the main. But it must be remembered that the last edition of the "Règne Animal" was published rather more than forty years ago; that the subsequent progress of science has been rapid in an extraordinary degree; and that numerous accomplished investigators have since profoundly studied the organization of many forms entirely unknown to Cuvier. The adoption of his classification, then, without the modifications necessitated by subsequent investigations, is entirely inadmissible. But, as if such a fault were not enough, the author has so patched up the original fabric with information derived from less reliable sources, and he has, from misapprehension of the meaning of diagnoses and scientific phraseology, introduced such strange definitions, as to give us something far worse than merely anachronous. Giving him the benefit of all his abundant ambiguity in language (certainly always where only a few exceptions could be offered to the applicability of the definitions), there still remain very numerous errors and faults of a less venial nature. For example, in the first paragraph of the work, which is a definition of the characteristics of the "vertebral [vertebrate] animals," such statements as the following might be pardoned: "A remarkable analogy is perceptible in the organization and structure of all the classes and orders of this division (?). The spinal or vertebral column, which consists of a series of bones, articulated or bound together, extends through the whole body. [Inapplicable to the sturgeons, sharks, rays, holocephali, and especially marsipobranchs, amphioxus, and numerous extinct groups.] The upper (?) extremity is crowned (?) with the head [there is no specialized head in amphioxus], and the lower terminates in the pelvis (!) or a tail [inapplicable to orthogoriscus and other forms]. This bony column contains the spinal marrow, where the organs of sensation—the nerves—have their origin, and from which they diverge. The principal organs of life are contained in the chest and abdomen. [How is this distinctive?] Animals of this division consist of two sexes, male and female [certain fishes are hermaphrodite]." Such careless errors might, we say, be pardoned. But it is not easy to overlook the concluding sentence: "Jaws incumbent, transversal, and furnished with teeth—rudiments of teeth are seen in the beaks of birds—and limbs not exceeding four, form the principal features which mark the character of the vertebrate animals." Jaw-teeth are absent in representatives of every class of the vertebrates; among mammals, in the pangolins and ant-eaters of the order especially called edentata, or the toothless, as well as in the right whales; in all living birds—not even rudiments of teeth being found, the serratures of the margins of the bills of many species being entirely different, and not at all homologous with teeth; among amphibians, in many anura; among fishes, in all the carps, dace, suckers, and the very numerous related forms, as well as many other families. Fore as well as hind members are wanting in the lampreys, amphioxus, etc. The definition which has thus been given in full—and which fails after all to bring into prominence the true distinctive characters of the type—may be accepted as an example of others. Of course, the entire work is worse than worthless as an exhibition of the present condition of science. It has been our lot to see circulated among the people of this country, without rebuke, many poor works professing to treat of scientific subjects; but not for many years has one so poor as this one been offered, and we take the opportunity to protest once more against such compilations by persons utterly unacquainted with the rudiments or methods of a science. Why will not our publishers get competent men as compilers? Messrs. Scribner & Co.'s school geographies are none the easier to beat out of the market because a competent geographer like Professor Guyot prepared them.

Pickett's Men: A Fragment of War History. By Walter Harrison, A.A. and Inspector-General of Pickett's Division, Army of Northern Virginia. (New York: D. Van Nostrand, Publisher. 1870.)—We have heretofore said, in speaking of the literature called out by the rebellion, that for the present the most useful war books are those which narrate the experiences of eye-witnesses; and the book before us is of this valuable sort. Col. Harrison served with Pickett's Division from Fredericksburg to Appomattox Court-House—that is, during the whole period of its existence under this title; for it was at the battle of Fredericksburg that Pickett first appeared as a division commander. More is in a name at the South than with us, and it was the custom there to call brigades, divisions, and corps after their respective leaders—a custom that is worthy of passing notice. Had it any real significance? Did it mark the aristocratic tendency of the Southern mind? Did it prove a lofty, sentimental sense of glory in the Southern breast? Some may incline to think that it did—that something more than life and fortune and sacred honor was dedicated to the fight when each general officer threw his name into the struggle, before all the world. Many subordinate commanders on the Southern side did the same. But of our Northern generals, whose corps, divisions, and brigades were numbered, not named, we lost some able and brave in battle, who had been distinguished on many fields, whose names were first publicly known when the lists of killed were read. They had thrown in their fame with that which their troops had won.

Col. Harrison's book is chiefly interesting as coming from a Southern hand. We are curious to learn the experiences of those who fought against us, and to note the tone and spirit in which Southern writers will deal with war topics. This author is, we must say, very fair. His book has no literary excellence, as indeed not much is needed for such works as this; but from its frank style we take it to have been written with no other aim than to tell truly the story of a famous body of troops. Under the heading of "The Call to Arms," the author gives briefly an odd statement of Virginia's position at that time; and we quote a sentence which we suppose to be a fair average of the talk of the most intelligent volunteers of the South round the earliest mess-tables and camp-fires. There is not a word about slavery in our author's summing up, and of his many causes of difference between Virginia and the North we are obliged to confess that this is the most grievous: "The cold calculations of Puritanism could ill agree with the liberal *laisser-aller* of Huguenot and Cavalier blood"!

Under the heading of "Military Organization" there is the usual reference to the everlasting fine horsemanship of the Southern youth; but the boyhood of Washington is responsible for this, and we ought not to complain of it, especially as "Pickett's men" went afoot. They set out under various brigadiers early in the struggle, and fought with credit under Beauregard, Johnston, and Lee before they were called together as Pickett's Division. They fared like their brethren until Gettysburg, where, as everybody knows, they suddenly rose above their comrades to a fame all their own, for none had dared to follow them. Two brigades, properly belonging to Pickett, had not come with him to Pennsylvania, and at Gettysburg he had only the brigades of Kemper, Garnett, and Armistead. These took no part in the fight until the afternoon of the third day, when they made a charge in praise of which it may be truly said that the world never knew a more glorious self-sacrifice for honor's sake. The author's account of the charge is good, but not very complete. Going forward to speak with General Longstreet, who was closely reconnoitring with General Lee, he caught an early glimpse of the Union position, and found it "frightful to look at." Again, he calls it an "infernal slaughter-pen," and says that the attempt on it was "a massacre." It will be satisfactory to Army of the Potomac men to read that when their cannonade opened in reply to Lee's "the enemy had the exact range of our line of battle," and long before the assault was ordered the Confederates lost many officers and men. The story of the charge and its repulse is well known. All supports failed, and Pickett's men alone penetrated the Union line: "they touched the vital point, they made the life-blood flow," this writer says; but it was all in vain—Garnett and Armistead were killed, Kemper was desperately wounded and captured. Of the colonels of regiments seven were killed on the field, and six were wounded, one mortally. Three lieutenant-colonels were killed and three wounded. In fine, of the whole complement of field-officers in fifteen regiments one only escaped unhurt. The loss in companies was in almost the same fearful proportion. It was one of the world's great deeds of arms.

Col. Harrison has but a low opinion of Maryland and Pennsylvania. Maryland was found to be too "loyal" by half; and in Pennsylvania they had a mean way of hiding horses in hay-lofts, wagons in beds of streams, and oxen at the bottom of their ice-houses. "And yet, your whiskey is good, Penn.! very good; but your water is bad, very bad"—especially, thinks the Colonel, the Gettysburg water which they now sell in bottles—that is abominable.

At Five Forks and Sailor's Creek "Pickett's Men" fought their last fights. Meantime, as they fought against Butler, south of the James, General Lee said of them: "We tried very hard to stop Pickett's men from capturing the breastworks of the enemy, but couldn't do it." Col. Harrison takes the welcome applause as a motto for his title-page. We like his book for its sincerity and good humor, and perhaps we were wrong to say that it has no literary excellence—it is by no means dull, which is meritorious, and the author has sometimes a dry, unsouthern mode of expression, while his comments often show quick perception. In his service in the field he had the nice observation to note that to the soldier expectant of orders to attack, the moments linger; and that in the midst of the fight the soldier is *too near* to see what is going on. We hope that publishers will be found for more books like this. They will help the coming historian, and interest and instruct all their readers of to-day.

A German Course. By G. F. Comfort, A.M., Professor of Modern Languages and Æsthetics in Alleghany College, Meadville, Pa. (New York: Harper & Bros. 1870.)—This manual differs from most of its rivals in two points. In the first place, it tries "to present every word and grammatical principle in a living natural sentence before it is defined or explained," so that the pupil may have, if he likes to use it, an opportunity to exercise his ingenuity as well as his memory. This aim is satisfactorily attained, and certainly the illustrative sentences are not the customary bald platitudes which repel and weary the student.

In the second place, the book contains a certain amount of philological information. This consists of a tolerably full history of the German language, and of continual illustrations of the development and formation of words. But this part is not wholly free from error. The very first paragraph tells us that the ancestors of the present inhabitants of Europe and Hindostan had their "early home in the western part of the Himalaya Mountains. From this mountain region one portion of this original stock moved down to the rich plains of India, and developed the Sanscrit language and literature and the Buddhist religion." But do even those scholars who judge that this early home is in Asia, place it among the mountains? And again, Why is nothing said about Brahmanism? Why not say that those Aryans who settled in the different parts of Europe developed the Protestant religion, and make no mention of Catholicism? That would be doing just about the thing that Professor Comfort has here done. The tables in comparative language cannot fail to interest the student.

In the strictly grammatical part, we find in general great clearness and ingenuity in the statement of the rules, although a change might be made in Section 244, on the use of prepositions with the dative and accusative cases, where we find they govern the dative case when rest within or motion inside of the object they govern is expressed. Is this the case with the example given—"Das Buch liegt auf dem Tisch"? It is but seldom, however, that we find any obscurity. There are certain grammatical points omitted; for example, the use of the adjective as a neuter noun after *etwas*, etc. The discussion of relative pronouns is especially incomplete. On the whole, however, the book is deserving of praise, being much more intelligently written than the majority of German grammars.

OLIVER DITSON & CO., Boston.
CHAS. H. DITSON & CO., New York.

The Nation Press.

The Proprietors of THE NATION PRESS give notice that they have established a Book, Pamphlet, Job, and Newspaper Printing-Office in this City, and are prepared to execute at moderate prices, for cash, the best of work in any and all of these branches.

For BOOKS they will furnish Electrotype or Stereotype Plates, as desired, and will guaranty unusual accuracy in their preparation.

PAMPHLETS of every description, embracing Prospectuses, Statements, and Reports of Corporations, Statistical, Scientific, and Literary Papers, Law Pleadings, etc., etc., will receive the same attention as books, and be printed with especial care.

JOB WORK, in all its details: Cards, Circulars, Programmes, Bills, Receipts, Forms, etc., will be promptly dispatched, with taste, and in the newest varieties of type.

NEWSPAPERS, MAGAZINES, and other Periodicals will be printed on reasonable terms, and strictly upon time.

In short, the Proprietors undertake to satisfy first-class custom in all that pertains to a general Printing Business.

Orders may be sent to THE NATION PRESS, 27 Rose Street (a few doors North of Frankfort), or to this Office, and estimates will be furnished at either place.

JOHN ROSS. Manager.

In Monthly Numbers, at Fifty Cents each, of which Twenty-two have appeared.

ILLUSTRATED TRAVELS

ALL ROUND THE WORLD:

A RECORD OF DISCOVERY, GEOGRAPHY, AND ADVENTURE.

EDITED BY H. W. BATES,

Assistant Sec. of the English Royal Geographical Society.

Prospectus.

The "ILLUSTRATED TRAVELS" is copiously illustrated with beautiful and authentic engravings, and gives accurate information of foreign countries, in the form of narratives, by travellers of the highest repute who have recently visited them.

In the choice of subjects for each monthly part, preference is given to those countries which happen to be of the most general interest at the time. Thus the different parts of the world are treated of in succession, and in course of time a body of useful information and entertaining reading on the most interesting subjects will be brought together, relating to the position, physical features, and natural productions of countries, and to the characteristics of their inhabitants, their institutions, customs, opinions, and everyday life.

The Political and Religious Aspect of Nations, Historical Geography, and Visits to the Sites of Important Events in Classical and Biblical History, Physical Descriptions of Interesting Regions, Narratives of Naturalists, Hunting Adventures in Wild Regions, Alpine Climbing—all these will be included in the range of subjects, as well as Narratives of Sea Voyages, Journeys of Discovery, and Descriptions of the Modern Condition of Countries.

CASSELL, PETTER & GALPIN,
596 BROADWAY, NEW YORK.

Rare and Valuable BOOKS,

IN EVERY DEPARTMENT OF LITERATURE, SUITABLE FOR

Public Institutions and Gentlemen's Private Libraries,

Offered for Sale, at very Low Prices, for Cash.

Our Stock is various, comprising the Best and Rarest Editions of Works IN ALL LANGUAGES, including

Illustrated Works,
Voyages and Travels,
Poetry and the Drama,
Biography and Memoirs,
Secret Histories,
French and Italian Works,
Latin and Greek Classics—English and Foreign.
Early Fathers in Theology, in their Original Tongues, with Translations, etc.

Together with a Rich Variety of
STANDARD WORKS IN BEST LIBRARY CONDITION.

Reviews, Encyclopædias, Magazines,
Etc., now offered at Ante-War Prices.

THE OLDEST AND CHEAPEST IMPORTING HOUSE.
ESTABLISHED 1840.

IMPORTATIONS BY WEEKLY STEAMERS.

CATALOGUE No. 58 now ready, and sent gratis on application.

SCHOULER ON THE DOMESTIC RELATIONS. Embracing Husband and Wife; Guardian and Ward; Parent and Child; Infancy; and Master and Servant. By James Schouler, Esq. 8vo, $7 50.

STORY'S COMMENTARIES ON EQUITY JURISPRUDENCE. Tenth Edition. By Joseph Story, LL.D. 2 vols. 8vo. Edited by I. F. Redfield, LL.D. $15.

MORSE ON BANKS AND BANKING. A Treatise on the Law of Banks and Banking; with an Appendix, containing the National Banking Act, with Decisions, etc. By John T. Morse, Jr., Esq. 8vo, $6.

AMERICAN LAW REVIEW. Vol. IV. 8vo, sheep, $6.

THE LAW OF TORTS. By C. G. Addison. Abridged for use in the Law School of Harvard University. 12mo, cloth, $3; sheep, $3 50.

CURTIS'S UNITED STATES SUPREME COURT DECISIONS. New Edition. Revised with reference to the latest Decisions. 22 vols. 8vo, $110.

In this edition these references have been brought down to and include the seventh volume of Mr. Wallace's Reports.

Ready in October.

UNITED STATES SESSION LAWS. The Statutes at Large of the United States of America, passed at the Second Session of the Forty-first Congress. Edited by Hon. G. P. Sanger. Royal 8vo.

HOUSE OF LORDS CASES on Appeals and Writs of Error, Claims of Peerage and Divorce. Vol. VI. 8vo.

Ready in November.

STORY'S COMMENTARIES ON BAILMENTS. By Hon. Joseph Story. Eighth Edition. Revised and enlarged by E. H. Bennett, Esq.

HOUSE OF LORDS CASES on Appeals and Writs of Error, Claims of Peerage and Divorce. Vol. VII. 8vo.

Ready in December.

ANGELL AND AMES ON CORPORATIONS. Ninth Edition. Revised and enlarged by John Lathrop, Esq. 8vo.

GRAY'S REPORTS. Vol. XVI. Reports of Cases Argued and Determined in the Supreme Court of Massachusetts. By Hon. Horace Gray, Jr. 8vo.

DANIELL'S CHANCERY PRACTICE. Fourth Edition. Pleading and Practice of the High Court of Chancery. Revised and greatly enlarged by Hon. J. C. Perkins. 3 vols. 8vo.

HOUSE OF LORDS CASES on Appeals and Writs of Error, Claims of Peerage and Divorce. Vol. VIII. 8vo.

Ready in January.

CONNECTICUT DIGEST. A Digest of all the Reported Cases decided in the Superior Court and Supreme Court of Errors of the State of Connecticut, and in the United States Courts for the District of Connecticut. By Simeon E. Baldwin, of the New Haven County Bar. Royal 8vo.

LANGDELL'S SELECTION OF CASES ON THE LAW OF CONTRACTS. With References and Citations. By C. C. Langdell, Dane Professor of Law at Harvard University. Vol. I. 8vo.

HOUSE OF LORDS CASES on Appeals and Writs of Error, Claims of Peerage and Divorce. Vol. IX. 8vo.

In Preparation.

A NEW LAW DICTIONARY.

DICTIONARY OF TERMS AND PHRASES used in American or English Jurisprudence, or which have been defined by Adjudications of the Courts. 2 vols. 8vo.

EVERY INTELLIGENT CLERGYMAN, THEOLOGICAL STUDENT, AND LAYMAN SHOULD PURCHASE AND READ

The Reign of Law.

BY THE

DUKE OF ARGYLL.

" This is in its way a masterly book—not a book of many ideas, but of a few very ably and powerfully put—by a man who has a real and accurate knowledge of many departments of natural history."—*London Spectator.*

" This volume is a remarkable work. . . . The style is simple and clear and not without eloquence, and the aptness and variety of the illustrations are striking." —*N. Y. Evening Post.*

" A very able book, well adapted to meet that spirit of enquiry which is abroad, and which the increase of our knowledge of natural things stimulates so remarkably."—*London Times.*

" 'The Reign of Law' bears the stamp of original thought, of accurate acquaintance with the most advanced science, and of a not unsuccessful intrepidity in combatting the positions of Darwin, Comte, and Mill."—*London Review.*

The Nation.

NEW YORK, THURSDAY, OCTOBER 20, 1870.

The Week.

THE state of things in France appears to grow worse and worse. Every day makes the hopelessness of the struggle clearer, and nothing does more to dishearten all the friends of France than the atmosphere of falsehood by which everybody connected with the press or with public affairs, except General Trochu, appears to be laboring to surround himself and the public. Everybody seems to be engaged either in deceiving himself or his neighbors; and even the men of thought, like Mazade and Louis Blanc, have completely lost their heads. Mazade, on the 15th of September, pours forth the same strain of folly as in the *Revue* of the previous fortnight, and consoles himself for the horrible reverses of Sedan by the reflection that to France belongs "the glorious privilege of astonishing the world." Louis Blanc, who has a well-earned reputation as an accurate observer and cool reasoner, raves like the lunatics of the *Gaulois* or *Figaro*, and, though an educated man, calls King William the "Attila of the Nineteenth Century," apparently for no other reason than that the former, like the latter, has fought battles in Champagne, and that the defeat of the Prussians on the plains of Châlons would be an agreeable occurrence. Jules Favre, of whom we dislike to speak with anything but respect, has published an account of his interview with Bismarck which reads like a letter from a young lady delegate to a woman's rights convention, rather than the report of a statesman deputed to debate with one of the keenest diplomatists of the age the fate of a great people, and that people his own countrymen. The figure he cut himself appears all through to be uppermost in his mind. He keeps an exact record of all his emotions; tells how he started from his chair, and how he writhed and agonized under Bismarck's dastardly propositions; how his strength was near failing him, and how near he came to breaking down, and so on—a most pitiful record, and well calculated to increase the contempt of the Prussians for their adversary, and harden their hearts against him.

As far as simple, unadulterated lying goes, it must be admitted that the Republic has, thus far, far outdone the Gramonts and Palikaos, and with less excuse. Attempts are no longer made to conceal disasters, but stories of successes are invented and spread, and, what is worse, stories of armaments and succors, and risings and reinforcements, which the men in power know have no foundation whatever. The "Army of Lyons," of which we have heard so much of late, has now been converted into "the Army of the Loire," probably because it was felt to be a little too barefaced to assign it to any specified locality, and it is now "on the Loire," and rolling up into the hundreds of thousands, and making ready to eat the Germans at a mouthful, although the Prussians are advancing without serious opposition on Tours—the regular troops flying before them. Of course, dozens of these disgraceful fictions are found out by the people every day, and every such discovery increases the want of confidence in the leaders which has been the curse of the war, as far as the French are concerned, and which is already threatening society with dissolution. The prefects report increasing difficulty in preserving order in their departments; the orders of the Government are disregarded, and the levies refuse to march. In many cases the National Guard are returning their arms, and many of the towns refuse to allow themselves to be defended, feeling certain of defeat, and dreading the Prussian artillery. Better pay contributions, they say, than be bombarded and burnt. Indeed, it would be almost impossible to find a parallel for the present state of things in France. Many weeks more of it, without some great success, which is very unlikely, would make Prussian conquest welcome to all owners of property.

From Trochu, on whom may now be said to rest the whole burden of the nation's sorrow, we hear little. He is undoubtedly laboring as best he can to infuse order and discipline into the vast and unwarlike host now under his orders in Paris, and his plan apparently is to break them in by means of small encounters with the enemy, brought on under favorable circumstances, and not pushed far enough to try them too severely. This mode of bringing undisciplined troops up to the mark has often been tried and succeeded, but never, we believe, under similar circumstances. It may be said to be essential to its success that the army should be in camp, or in a fortress to itself, away from civilians and civilian influences, and completely under the control of the general. The army of Paris is not only, however, made up largely of men fresh from civil life, but of men still in civil life. It is surrounded by a million or more of non-combatants, to whose cackle it listens when off duty, by whose moods it is inevitably affected, and whose fears and panics and despondency it must inevitably share. Moreover, these non-combatants will soon begin to suffer seriously from scarcity of provisions, and the troops will be constantly cognizant of their privations, and constantly within hearing of their plaints. If Trochu can make a body so situated a match, even behind stone walls, for such an army as that of the Crown Prince, he will do more than any military man has ever done before him. The exposure of the city to bombardment becomes every day more inexcusable, as it is every day more evident that no relief from the outside is to be looked for.

Among "the campaign stories of the week" has been a report announcing the raising of the siege and the general retreat of the Prussians. There was another, from Tours, heralding the destruction, by the fire of the Fort du Mont Valérien, of all the Prussian works in a circuit of six kilometres; the driving of their engineers from Clamart, Meudon, and Montretout; the recapture of Villejuif and Champigny, and a number of other exploits achieved by the Parisians. And there was also an official bulletin, issued by Gambetta at Tours, proclaiming that, on the 12th inst., "the Prussians were driven out of all the positions which they had been occupying for weeks . . . driven beyond Stains, Pierrefitte, and Dugny;" beyond "Joinville, Creteil, Champigny;" "forced from Bas-Meudon and St. Cloud, and thrown back on Versailles." The truth of the matter, however, is, that the exploits of "the more than ever heroic people of Paris" consisted in some feeble reconnoissances and sorties, which caused the falling back of the Prussian outposts, and ended, like all preceding ones, with repulses; that the fire of Mont Valérien did its principal havoc in the chateau of St. Cloud; and that the Prussians continue to hold their positions all around the city, whose only means of communication with the second capital, Tours, remains the balloon. A conveyance of this kind lately took out M. Kératry, who followed his colleague in the Government of National Defence, M. Gambetta, to Tours. The latest aerial messenger, who alighted in Belgium, reports the Prussians to have made the opening shots of the bombardment on the 14th, which lacks confirmation from other quarters.

We have no sufficient data to enable us to judge whether General Trochu, Jules Favre, and their military and civil associates in the rule of the city do or do not display all the energy and vigor demanded and possible under the trying circumstances. What we do know is that their activity, both military and civil, is greatly, if not fatally, hampered by the doings of some young and old fools whose wisdom consists in reminiscences of the revolutionary years 1793 and 1848, and whose patriotism, when unity of action and harmony demand self-abnegation, always yields to the promptings of vanity and vulgar ambition. Thus we see "Red" revolutionary movements going on, within walls, against the Government of National Defence; we find Gustave Flourens—the youthful hero who once rose in insurrection against Napoleon, and marched along through the night putting out the lamps until he took to flight—heading a rebellious opposition to the decree of the Government postponing the elections; and we hear of a commander of a battalion of National Guards having distributed cartridges among the men "preparatory to marching on the Hôtel de Ville." The establishment of a "revolutionary commune," as it existed during the Reign of Terror, is demanded—and that within hearing of the Prussian guns, and while food is getting scarce. Félix Pyat, a hero of 1848, whose deeds have always been words, reproaches the Government with having betrayed Toul and Strasbourg by their cowardly negotiating for peace, and after elegantly telling them that "Toul is a frontier lost, Strasbourg is a gate of Paris," also reproaches them with "scattering flowers of rhetoric," and then cruelly exclaims: "Begone! your deposition is pronounced!" More patriotically disposed, Victor Hugo turns the shafts of his rhetoric chiefly against the Prussians, and tells them that they are doomed, the theatre of war having changed: "No more forests, no more thick fogs, no more tortuous tactics, no more gliding along in the dark. The strategy of the cat will not avail when you meet the lion. In vain you will step softly. The very dead will hear you. Paris is watching you—the thunder in her hand. . . . Your facile successes are over. . . ." And then he calls them names —"Borussians," "Vandals"—and quotes Shakespeare against Moltke—if we understand him aright.

Where Paris does not watch the Germans—"the thunder in her hand," as Victor Hugo says—they continue to achieve more or less "facile" successes. They have reduced Soissons by a heavy bombardment, under the Duke of Mecklenburg-Schwerin, capturing four thousand prisoners and one hundred and thirty-two guns; they have captured Épinal and Vesoul, the capital towns of the Departments of Vosges and Haute-Saône; have closely invested Verdun and New Brisach; have entered Somme in force, occupying Montdidier and threatening Amiens; have occupied Breteuil, in Oise, and Les Andelys, in Eure, and reached Fleury, in the very vicinity of Rouen; have pushed their advance westward as far as Alençon, in Orne; have achieved another victory near Orléans, on the 11th, entered that city, crossed the Loire, and pressed the French forces back beyond La Ferté-St.-Aubin, the latter probably retreating in the direction of Blois and Tours. An official report by the general commanding the French Fifteenth Corps, which was successively defeated on the 10th—at Artenay—and on the 11th, shows the disastrous character of its last reverse: "Our troops, who . . . had taken part the day before in the battle of Artenay, gave way. . . . I was obliged, in order to check the enemy's progress, to go forward personally with three battalions of the reserve. . . . The enemy was checked for three hours, but at last we were broken and overcome by their shells." The general praises the bravery of his troops, but a correspondent of the *Tribune* with "the Army of the Loire"—a term, as it seems, identical with "Fifteenth Corps"—restricts his praise to the Mobile Garde, the Foreign Legion, which "was almost entirely destroyed," and the Pontifical Zouaves, and speaks very severely of the demoralization pervading a part of the line. If the description given by that correspondent of things witnessed around Orléans and in Tours be in the main correct, the condition of affairs in that quarter must be really deplorable.

Tours appears now to be threatened by a double advance of the Germans, on both sides of the Loire, from La Ferté-St.-Aubin, south of Orléans, where they are said to have established their headquarters after crossing that river, and from the vicinity of Châteaudun, in Eure-et-Loir, where they recently appeared in some force. The means of opposing this advance seem to be exceedingly scanty. The capacity of the defeated commander of the French forces on the Loire being doubted, he has been temporarily superseded by General Bourbaki, though the latter was to leave for the North, where all the large towns—fortified as well as unfortified—are apprehensive of attack by the Prussian forces made disposable by the capture of Soissons, or by others arriving as reinforcements. Gambetta, for the last few days the soul of the Government at Tours, has left for the seat of the war in the East. Lyons and Marseilles continue to be agitated by political movements of an extreme character. Disobedience to the new authorities manifests itself also in various other localities. Rumors are also current that Bazaine, who has been quiet for a number of days, is negotiating for the capitulation of Metz. And amid all these extraordinary difficulties and perplexities, the slight successes achieved here and there by Francs-Tireurs or Guards over Prussian foraging parties, or now and then by the defenders of Paris in skirmishes before the ramparts, have thus far been the only events calculated to encourage either branch of the Government of National Defence in clinging to the determination to cede for peace "neither an inch of territory nor a stone of a fortress." The Paris branch, however, can boast of having firmly stood a siege for a full month.

Anybody who wants really exciting war news we must advise to subscribe to the New York *World*, the European despatches of which are really as horrible reading as anybody can wish for. The way the Germans are nearly every day maltreated in its columns is positively inhuman, and we protest against such atrocities in a neutral paper. At that last great fight before Paris, the Germans not only had their besieging lines broken in, but were slaughtered and otherwise disposed of to the extent of eight (eighty?) thousand men, not to speak of artillery and standards. The poor devils are now crouching in the woods around Paris, badly cowed. At Soissons, the slaughter too was so dreadful that the Duke of Mecklenburg-Schwerin "wept and wrung his hands." From the accounts given by the *World* of the earlier portion of the campaign, we felt satisfied that the affair would end pretty much as the *World* describes it—that is, in the imprisonment of the whole Prussian army around Paris, with angry peasants rising around them, the great guns of the fortresses playing on them, Garibaldi and Bazaine cutting off their retreat to the Rhine, and the National Guard cutting off everything else, and the Crown Prince wasting away with hunger in Versailles. They now see how much better it would have been for them to have surrendered at Sedan, as the French would then have let them go home.

Fuller returns from the late elections substantially confirm the summary we gave last week. In Pennsylvania, sixteen Congressional districts have been carried by the Republicans, seven by the Democrats, and one (O'Neill's) by the mixed supporters of an independent candidate. This leaves the delegation divided practically the same as now, though the Republicans have lost two districts (involving, we are not sorry to say, the retirement of Mr. Daniel J. Morrell), and gained one, namely, that which Judge Woodward lately represented more respectably than most of his colleagues. In the State Legislature, the Republicans have a majority on joint ballot, and in Philadelphia they carried their local ticket by about 5,000 majority in a vote which showed a marked falling off from that called out by national questions. In Ohio, the Republican State ticket was carried by about 15,000 majority, and here, too, the Congressional delegation remains unchanged in character —each party having gained and lost two districts—unless Mr. Schenck succeeds in contesting his seat with Mr. Campbell. The latter owes his slight majority to two causes, doubtless—dissatisfaction on the part of certain Republicans with Mr. Schenck's notions about the tariff, and the really moderate and sensible way in which the late Minister to Mexico behaved when returned to the State Senate. The Democrats have carried Indiana by a majority of about 2,000, and gain one representative. What is of more importance, and by no means a national misfortune, is the fact that they have a small majority on joint ballot in the Legislature, thus ensuring a Democratic successor to Senator Morton in case he accepts the mission to England, which is now rendered very doubtful. In Iowa, finally, the Republicans seem to have lost one Congressman in the Third District, lately Mr. Allison's, by a very considerable Democratic gain, but small majority. On the whole, as we have said, the Republicans have held their own, and the Democrats, it is certain, will not control the next Congress.

The Administration has committed a serious mistake in allowing Mr. Cox to resign, or, to speak more correctly, in having allowed free play to the influences which have forced him to resign. All the able and most influential Republican papers acknowledge its gravity.

Messrs. Chandler and Cameron, probably two of the worst politicians in the country, are believed to be at the bottom of it, and, coming as it does simultaneously with the President's absurd attempt to influence the Missouri State election by a very gross abuse of his appointing power, it opens up rather a troublesome prospect for the remaining year of his term of office. It is not yet too late for him to retrace his steps, and retain what will be of tenfold more value to him than all the "managers" in the country can do for him, and that is the respect and confidence of the honest men "outside politics," a body of considerable weight and influence in the long run. Gratz Brown, of whose speech only a telegraphic summary has reached us, has openly declared war on the administration in Missouri, denouncing the President's policy as "intolerable."

The state of "politics" in this city is this: Last spring, when the New York Charter was passed, the Republican members of the Legislature were induced to support it, under an arrangement by which Republicans were to have a proper share of the municipal offices. This arrangement was carried out, and it created a body of persons known as "Tammany Republicans," who are powerfully, and, as it proves, overwhelmingly, represented by the Republican Committee, which is charged, in New York, with the care of the rights of man and other interests of that nature. The "Young Democrats," or the new Democratic opposition to the Tammany Ring, have now had the grace to nominate Mr. Ledwith, an honest and independent Democrat, for Mayor, and invite the Republicans to help them to elect him, as the first and best means of overthrowing the rule of the Ring. A portion of the Republicans are ready to do so, and a meeting of the committee was called to consider the matter last Saturday night. There was a fierce debate, which was only prevented from degenerating into a breach of the peace by the presence of a strong body of police; but the Tammany Republicans, who do not want to have Ledwith elected, and therefore wish to make a separate nomination, or "a straight Republican ticket," mustered in such force that they carried their point amid tremendous uproar, and the minority, headed by Collector Murphy, left the room in disgust. The minority includes Mr. Charles S. Spencer and other gentlemen of that stamp. One of his reasons for wanting to adjourn was, he said, "respect for the Sabbath," the debate having been protracted beyond midnight—an announcement which the wicked Tammany men received, we are sorry to say, with derisive cheers. Our opinion is, however, that, in spite of Mr. Spencer's open confession of his reverence for the Lord's Day, the piety of the two sections is about equal, and we would not have any Republican hesitate between them on that ground. But any Republican who votes for "the straight Republican" Mayor, nominated by the Tammany Republicans, will to all intents and purposes vote for the nominee of the Ring and for the continuance of its vile rule. It will be the highest duty of every Republican, therefore, to repudiate on this occasion the regular party nomination.

We are about to have in New York, on the first Tuesday in November, the trial of a question in which the whole country will be interested—namely, whether the United States Government can enforce order and regularity and honesty at elections in this city, in defiance of the Tammany Hall mob. Under the new law, the Marshal has full power over the proceedings, but if he were left to rely for support simply on his deputies, the mercenaries of the Ring would have no difficulty in overpowering him and having things their own way. We believe, however, that the Government has been advised to make, and is making, preparations to put the army and navy at his disposal, in much the same fashion in which they were used to preserve order at Lincoln's election in 1864. We have no doubt that we shall therefore have a day of extraordinary quiet, and an election of extraordinary purity. If it should not be a day of quiet, however, and if an attempt should be made to carry out the Ring programme, and the Government should do its duty firmly, as we hope it will, and a number of our citizens should be removed by violence from their present spheres of activity, we must honestly confess that we are unable at this moment to think of any good reason for regretting it. This sounds inhuman, but there are so many of our citizens whom the ballot has so completely failed either to elevate or to purify, and whose growth in rascality is so steady, that it would really be hard even for their best friends to protest against their taking off.

General Robert E. Lee died, on Wednesday week, of nervous prostration, brought on, doubtless, by the fatigues and anxieties of the war, and, more immediately, by the awful chagrin—we will not call it remorse—which must have come in the silence and desolation of peace to every man who bore a prominent part at the South in carrying on the war. Skill, courage, patience, and fortitude, and all in the highest degree, nobody can deny him, and we are glad to say that, so far as our observation has gone, not one who has noticed his death has attempted to do so. Everybody acknowledges that, whether his share in the rebellion was his folly or his fault, he made, by his demeanor since he laid down his arms, the best and, indeed, the only atonement a brave man could make without forfeiting his self-respect. And, now that it is all over, and that men's judgments of him have, at best, only a literary value, we may say that he was a type of soldier which any race may be proud to produce and would do well to cherish. When one watches what is happening in France, and sees how hard it is even for a nation trained to arms to bring to the surface, even in the throes of despair, the strong, silent man who can take the fortunes of the State on his single head, and bear them valiantly—serene and resolute and still—the North, as well as the South, may do worse than respect Lee's memory, rebel and traitor though he was. How anybody can look at him as a psychological puzzle because, having taken the military oath to the United States, he afterwards bore arms against them—and some do so—we cannot well understand. History is full of cases in which men, greater and better than he, broke an oath of allegiance to an established government as he broke his, in the interest, real or imaginary, of higher things, and yet retained the respect of all the world and their own. That which will, perhaps, if anything will, cloud the estimation in which he will be held by posterity is his failure, when in the very flush of his power and influence, to do anything to put a stop to the atrocities of the Libby and of Andersonville. That he did not know of these horrors it is hard to believe; that, knowing of them, he should have done nothing to hinder them, those who admire him as a man, still more than those who admire him simply as a Southerner, will always remember as a great stain on a great name.

We are surprised and pained to find that none of the lecturers this winter have made any preparations, so far as our knowledge goes, for the continuance of those assaults on "caste" which last year and the year before attracted so much public attention. Miss Anna Dickinson has gone off after Joan of Arc; and Mr. Sumner is, we are told, going to point some moral with the Franco-German war, and "caste" is going, we fear, to have full swing, though, it is true, we have not yet heard from General Logan. Now, considering how powerful caste was last year, and what fearful havoc it was playing with the body politic and social, and what desperate efforts its votaries were making to confirm its hideous sway—witness the nose-pulling case in Boston, and General Sherman's attempts to make himself a marquis, and give evening parties; and considering, too, how deep-seated was the dislike of white people to marrying colored people, in spite of the plainness of their moral duty in that regard, nobody, we hope, will have the assurance to tell us that the danger is over, and that the monster has been slain by one course of lectures. We are, therefore, driven to some very painful conclusions about its last year's assailants; but we shall not utter them; our hearts are too full. This we may say, however, that any undaunted politician, who boldly avows his hatred of caste, of aristocracy, and of monarchy and of orders of nobility, and his respect for the will of the people, will meet with the heartiest support from us under any persecution to which he may be subjected. These are not the times to allow outspoken and fearless men to be put down.

MR. COX'S RESIGNATION.

It is, of course, very unfortunate that so valuable an officer as Secretary Cox should resign his place in the Cabinet, but it would be still more unfortunate if the public were left in ignorance of, or under any misapprehension about, the cause of his resignation. An attempt has been made by some of the more zealous party papers to ascribe it to purely "personal" reasons, and there have been one or two insinuations that, as he was not in entire sympathy with the party about the suffrage, it is, perhaps, not altogether to be regretted that his official connection with it should cease. But we believe we run no risk in saying that his motives for retiring are no more "personal" than those of an officer who finds a place which he has filled faithfully and well made untenantable must always be; and that the suggestion that he does not agree with the party touching any of its fundamental doctrines, or any great feature of its policy, is simply one of the modes in which the party hacks raise the mob on any honest man whose presence is inconvenient and whom they determine "to run off." Just as "soundness on the main question" has been made a cover for every vice, from burglary to habitual drunkenness, so unsoundness is used as an excuse for covering the purest reputation with mud. His resignation has, in short, nothing to do with his opinions or with his private comfort or convenience. It is simply and solely the result of the President's failure to support him in the maintenance and prosecution of the reforms which he has introduced into the Department of the Interior, and the value and extent of which the press of all parties is now acknowledging with gratitude. He has introduced there changes which, three years ago, seemed well-nigh out of any man's power, and the extension of which in all branches of the Administration would be one of the greatest blessings which could befall the country. He has filled the working force of the Department with competent, well-educated men of good character, and has shown that such men can serve the Government better than others, and without any derangement of the political machine. He has, moreover, broken up the innumerable rings which the nature of a great deal of its business gathered around the Department during the late Administration, and, in fact, has made probably the most complete clearance of jobbery and corruption which any one department in Washington has witnessed in our time.

Now, that this sort of work would be done in all the departments, and that the Cabinet officers would have the hearty support of the President in doing it, was, we believe, the general expectation of the country when the present administration came into power; and it was generally believed that Grant, not being a politician, and yet possessed of a reputation so great as to enable him to set politicians at defiance, was just the man to effect this great and long-desired but hardly-expected revolution. It was, we believe, on the understanding that he was such a man that Messrs. Hoar, Fish, and Cox took office. Had he issued a declaration, on taking office, that he was going to revolutionize the civil service, by making appointments on business principles, we believe the country would have hailed it with delight, and have supported him firmly. Declaration or no declaration, however, it would have stood by him in trying to do right had he trusted it. But he lost heart very early in the fight—a novel sensation for him of all men, whose courage on more terrible fields has usually grown as his fortune seemed to wane. He apparently could neither make up his mind to work with the politicians nor to break with them, so he tried a compromise, and it has met with the usual fate of such attempts. The politicians at first assaulted the departments openly, and attempted to carry them with a rush. Finding this unsuccessful, they sat down before them and opened a regular siege. They became "cool" with the Administration, disregarded its suggestions, rejected its nominations, and affected to treat it as of little account. They spread abroad through the country reports of its failure and "weakness," and, having produced a certain amount of demoralization at the White House in this way, they began openly to point out to the President the injury Hoar was doing him by his "brusqueness," or Cox by his inflexibility or his new-fangled notions, or that he was doing himself by his failure to consult "practical men," who could show him how things were managed "inside politics." This, of course, gradually produced its effect. Hoar was sacrificed first, by a direct dismissal; Cox is now sacrificed, by a refusal to sustain him in the execution of his reforms. Fish, we venture to predict, will not last much beyond December, and for the same reasons; and then we shall have the reign of the old schemers fully restored in all the departments, and—this is the worst of it—managing a President totally unfamiliar with their arts, and totally unable to detect even the worst of the snares into which they are sure to try to lead him.

Now, what is the disease from which American politics are suffering? Is it not the corruption and dishonesty of the great body of persons who carry on the government? Suppose this evil removed or greatly diminished, what else is there in American polity to cause anybody to be disheartened or disturbed—human nature being what it is? What is it that makes these persons corrupt? Is it not the fact that office-holding is the only business in the United States, producing a regular income, in which a man needs neither character nor capacity, and into which a man can get without possessing either character or capacity? Supposing we barred the entrance to the public service to this class of persons, what is there in politics that would make the game worth the candle to the great army of adventurers, and ignoramuses, and gamblers, and tricksters who now make it a low and justly despised profession? Would they not quit it if, as Mr. Kelley of Pennsylvania has pointed out, the business of Congressmen were legislation simply, and not the keeping of intelligence offices to provide places for the broken-down, or unsuccessful, or vicious? The first political question in every country is, what kind of people compose the state?—the second is, what kind of men make the laws and execute them?—what kind of laws are passed? is only the third. A people of high political capacity will make almost any government serve their purpose, but no government can be made to serve any good purpose long which is worked by rascals, and in the operation of which nearly all the virtues and all the gifts and acquirements are treated as if they did not exist or were of no value.

The Methodist Church has been lately getting up a political reform movement. If its promoters mean by this a movement for preaching generally against corruption in the style of the *Tribune*, say, or of a Republican orator at a ratification meeting, they may save themselves all further trouble. They will find nobody to disagree with them, and might thrash the empty air in this way for twenty years and find things at the end no better. We may say the same thing of all general exhortations to individuals, from the President down, "to appoint none but good men to office." Some Presidents will appoint good men; others will not; and some will try to appoint them, and give it up as too troublesome. It is the SYSTEM which is rotten, and it is the system which must be reformed. Dependence on individual men chosen by nominating conventions is simply vanity and vexation of spirit. The desire of the nation for honest servants must be expressed in *laws*, and not in resolutions only. There is at this moment a convention sitting in Cincinnati for the discussion of questions of prison reform. Some of the ablest and most experienced philanthropists and reformers in this country are attending it; some of the ablest in Europe have sent papers to it. Every day of its sittings a vast amount of valuable information and wise suggestion as to the treatment of criminals is laid before the world. Now, does anybody suppose that its deliberations are likely to have the smallest effect on the prison discipline or the police system of the United States? Nobody, certainly, who is competent to form an opinion about it. And why not? Simply because the administration of the prisons of the country, like every other branch of the administration, has been gradually but surely taken possession of by a distinct class, composed of ignorant and often unprincipled men, who regard the management of prisons as part of the "party spoils," and treat all interference with them on the part of reformers as the meddling of visionary busybodies. There has been a hard-working Association for the improvement of the condition of the prisons in this State in existence for twenty-five years, and containing some of the ablest jurists and philanthropists we have. It has inspected, reported, and preached year by year with unsurpassed intelligence and fidelity; and yet the state of the prisons is now far worse than when they began. We might multiply these illustrations indefinitely. They present themselves in every department of the Government.

The American people is full of generous and noble ideas. It is animated by the most ardent desire to make real and valuable contributions to the work of human progress. It would fain do justice, and dearly loves mercy. It seeks, above all things, to make its institutions models for all nations. But all this passionate love of improvement, which, rightly directed, and with proper machinery at its command, might move mountains, is absolutely arrested at the door of every public office. Inside, it finds neither service nor expression. If we wish ever to see the greater features of the national character, its faith, its hope, its charity, its openness to new ideas, its vigor and ingenuity in controlling circumstances, and its singular, we may say unparalleled, capacity for dealing with social and political problems, fairly embodied, as they ought to be, in the government, we must, before all things, improve the system through which the machinery of government is kept going. Mr. Cox's retirement is certainly, as far as this is concerned, not a hopeful sign, but we must trust that either he or the President will yet find a way to retain his services for the nation.

PRESCRIPTION IN INTERNATIONAL LAW.

THE question which has been raised in the discussion about the cession of Alsace and Lorraine to Germany, whether, even supposing the inhabitants were not wholly French in feeling, France could defend her unwillingness to surrender them on the ground of prescription, can hardly yet be said to be a practical one, as far as the present war is concerned; but we are still far from the final political division of Europe, and we may be sure it will have considerable importance in the discussions which are still to come. Whatever be the nature of the title acquired by prescription, the essential fact contained in it is the lapse of time. However jurists may have speculated as to its origin, whatever convenient fictions judges may have invented to account for its operation, it still remains that lapse of time is what works the change of property, is what destroys the right of the former owner without his consent, and perfects the right of the present occupant. If an analogous international prescription exists, it assumes that a State has at some past time obtained possession of certain territory, either rightfully or wrongfully; that it has continuously retained possession of that territory, claiming and asserting sovereignty and dominion over the same; that such possession and claim have lasted for a sufficient period of time; and that thereby an absolute right has accrued to the State, not only against other nations who have no valid title, but even against the nation which was the true sovereign, and against the inhabitants of the district itself. Does such an international prescription exist? Many jurists of great authority answer this question in the affirmative, among whom are Grotius, Vattel, Edmund Burke, Wheaton, and Phillimore. None of them, however, pretends that the international law has established any definite limit for the duration of the possession in order that the territorial right may become absolute. The utmost they assert is that a lapse of time, sufficiently prolonged, will have this effect. The arguments by which they maintain their position are that the doctrine of prescription, as applied to national dominion, is a part of the law of nature; that it is analogous to the same doctrine as applied to private ownership; that it is universally recognized; and that it is necessary to the tranquillity of peoples, the safety of states, and the happiness of the human race, as a preventive of constant war and bloodshed.

This is certainly an imposing array of authorities; but a little examination will show that their conclusions are based upon no secure foundations either of fact or of argument. In the first place, the reasoning of these jurists consists in great measure in arguing from the analogies of the municipal law. Now, in truth, there is no such analogy, simply because the great essential fact upon which the doctrine of acquiring private property by prescription is founded is entirely wanting in the international code, nor can it possibly be supplied. When we reduce private prescription to its lowest terms, we arrive at the following idea as its very centre and support, viz.: The law always gives to the rightful owner of a thing the requisite judicial means and instruments for asserting his claim and establishing his property against a wrongdoer. If, while he possesses these means, he neglects to enforce his rights until a defined period of time has elapsed, he shall not thereafter be heard in his own behalf; for the purpose of quieting titles, of promoting peace and order in society, the property of the once wrongdoer shall now be considered absolute. So completely does the municipal law recognize this as the basis of prescription, that if the original owner be not capable of pursuing his remedies, the time during which such incapacity lasts is not counted against him. Now, the international law gives to a state or people who have been wrongfully dispossessed of their territory no such remedy, and no remedy at all; for it is a mere perversion of terms to call an appeal to arms a juridical remedy, where the dispute must be decided without reference to right and justice, and simply by superiority of physical force. We cannot say, therefore, of a state in this condition that it has ever slumbered on its rights, that it has neglected to enforce its claims, because it cannot for a moment be urged that a state *must* commence a war as an individual commences an action at law, or else be barred of its demands. The very elemental idea of prescription is thus wanting in the international code.

In the second place, the concession that there is no definite, fixed limit of the duration of time which shall work a change in national dominion, is altogether fatal to the theory that such prescription exists. In every system of municipal law a definite, fixed limit is assigned, and is essential; otherwise, every private prescriptive right would be a mere question of fact, depending entirely upon the varying views of the tribunals which decide such issues. A rule of the international law should be practical, capable of being followed and observed; but the rule as stated by most writers is wholly unpractical, and cannot be followed or observed. As the law itself does not assign any definite limit to the lapse of time, who is to appoint such limit? The state in possession will claim that the duration of time since the acquired possession is sufficient; the state or people to whom the original and rightful dominion belonged will deny that the period has been long enough. Who shall decide between them, since the law does not? There are no international juries or triers to put such questions of fact at rest, and the only thing that remains is an appeal to arms. Thus, we find that the rule which Vattel and others invoke to quiet titles, to prevent bloody wars, to preserve peace, will have no such kindly effect. The most that can be said of it is that it may shift the immediate cause of hostilities to the contention whether the duration of possession has been long enough; it will entirely fail to remove that cause. It seems to be an indisputable proposition that, by admitting the entire indefiniteness of the lapse of time necessary to constitute a prescriptive right of dominion, its advocates have admitted away the right altogether.

Lastly and principally, we cannot call that a rule of the international law which no nation ever feels bound to obey whenever her interests lead to a disregard of it. There are many rules which all states observe under all circumstances, and these collectively may with propriety be said to constitute the international law. But the rule in question is not one of them. We do not hesitate to say that no nation of Europe or America would feel herself bound to refrain from enforcing otherwise just claims on the sole ground that a prescriptive right to the subject-matter had accrued in favor of some other nation. Indeed, instead of prescriptive rights of nations forming a part of modern international titles in Europe, the exactly opposite principle seems to be, if not universally adopted, at least allowed to exert a controlling influence. This principle is the doctrine of nationalities, or, in other words, the idea that peoples united in race, in language, in common sentiments, hopes, aspirations—in short, in all which constitute organic life and homogeneity—are also entitled to be united into states and political societies. Before the force of this principle old dynasties, governments, and territorial lines have given way, and the map of Europe has been rearranged. To mention no other instances, the kingdom of Italy owes its existence to the effect of this idea. The time-honored duchies and inferior monarchies were swept away and the peoples incorporated into one body politic. But this was not enough. Venetia had been under the Austrian control since the Treaty of Campo Formio in 1797; this dominion was ratified by the great treaties of 1815; so that the possession of Austria had continued about seventy years. But the Venetians are in race, language, attachments, and geographical situation a part of Italy. Therefore, the kingdom of Italy, which had no legal claim whatever to Venetia, except the strong desires of both peoples, demanded the cession of the Adriatic province to herself, declared that the refusal to cede was a cause of war, commenced hostilities aided by a powerful coalition, added the Venetian territory and people to her own, and all Europe not only acquiesced but applauded. And now, with no more of a legal claim, she has absorbed the Eternal City, and made Rome the capital of her completed dominions. The Duchies of Holstein and Schleswig had for generations been under the sovereignty of Denmark, but the people were asserted to be German and not Scandinavian. The Germanic Confederation demanded that they be released from the Danish supremacy, and enforced their demand by force of arms. The overwhelming desire among the German peoples for unity, for one organic Germany, abolished the old Bund, drove Austria from its German alliances, blotted out several independent principalities and free cities, and effected a consolidated organization, which will soon become a homogeneous state, and will finally embrace all the peoples of German race and speech.

At the close of the Napoleonic wars in 1815, Europe was parcelled out in the interest of dynasties and to preserve the balance of power, but no attention was paid to prescriptive rights or the claims of nationalities. Europe is now rearranging in the interest of peoples with reference to affinities of race, language, sentiments, but again no attention is paid to prescriptive rights. It is certain that the nations of the world do not recognize prescription as conferring absolute dominion. We may go further, and say that it is very doubtful whether they ought to do so. International prescription would not prevent a single war, nor the shedding of a single drop of blood. It would generally be invoked in the interests of power against the weak, of oppression against the oppressed; it would obstruct popular uprisings of peoples to shake off an old and hated yoke; it would sustain long-enthroned dynasties against the will of their subjects; it would perpetuate wrongs that none can speak of without indignation.

THE BUSINESS SIDE OF JOURNALISM.

THE controversy which has been raging for some months between the New York papers about the ownership of the telegrams received from certain correspondents at the scene of hostilities in Europe, is, perhaps, except the great increase in the consumption of lager-beer, the most curious incident of the war on this side of the ocean. It has been confined exclusively to the members of the Associated Press, or, in other words, to the leading daily journals in this city. This Associated Press is made up of gentlemen who make a profession of giving the people advice on nearly every subject of human interest. They let them know when the landlords are asking too much rent for their houses, when the butchers are charging too high for their meat, and when the servants are getting too much wages. They point out the good books for purchase, the bad ones for rejection. They give the laborer directions where to find employment, and the capitalists how to find labor. They issue frequent, if not daily, counsels on the general conduct of life, on health, manners, dress, domestic economy, the use and abuse of spirituous and malt liquors, furniture, and amusements, and the education of children, the best means of preserving beauty and mitigating the ravages of old age. They tell merchants when to make things snug, and bankers when they ought to contract their loans; and Congress what laws it should pass or repeal, and when and about what it should declare war. They let military men know how to command the army, and naval men how to manage the navy, and point with unerring finger to the defects of the military and naval schools. From no quarter does vice meet with more scathing rebukes, or virtue with heartier commendation. It must be said, too, that the public evinces its gratitude for this vast range of instruction by pouring on the philosophers who offer it a perennial shower of gold. They are all rich, and becoming daily more so. To all appearance, no men living unite so many advantages in their own persons.

When wisdom and knowledge little short of superhuman are combined in any man with power and wealth, his walk and conversation, and, above all, his management of his personal affairs, ought to be a model to his contemporaries. One might fairly expect, therefore, that the manner in which the Associated Press collects its news, divides it amongst its members, and raises the money for the expenses, would be something which merchants would study as an example of enterprise, order, and economy; moralists as a practical application of pure justice; and the students of "business colleges" as an illustration of the value of urbanity and mutual forbearance in commercial dealings.

The melancholy truth is, however, that this simple operation is *apparently* conducted very much in the way in which we might suppose a set of thievish pedlars would carry out and settle a joint venture in "Yankee notions." The public, which is probably not so much interested in the cause of the wrangling as disgusted with its incessant reappearance in the columns in which they look for news and wisdom, ought to know, in order to understand the matter, that there are three or four correspondents at the seat of war who write constantly for the London *Daily News* and *Pall Mall Gazette*, in which papers their letters appear nearly every day. Occasionally—after a great battle, for instance—the *Tribune* correspondent in London telegraphs the whole of one of these letters to his paper here; but this has only occurred three or four times. Generally, he only telegraphs a summary of them, or one item of news taken from them. These correspondents the *Daily News* and *Pall Mall Gazette* invariably call "their special correspondents," and for these journals unquestionably the bulk of their work is done. The *Tribune*, however, designates them in the same way. This led the other papers here to charge the *Tribune* with false pretences, and the *Times* accused it with having taken the account of the battle of Gravelotte in particular from the columns of the *Daily News*, where, in truth, it appeared word for word as it appeared in the *Tribune*. To this the *Tribune* replied that it supplied its London contemporaries with war news, and supplied the *Daily News* with the story of the battle of Gravelotte, under an arrangement very similar to that by which it supplied it to the *Times* under the rules of the Associated Press. This seemed to settle the matter; but about a fortnight later, the *Tribune* retracted this statement, complimented the *Daily News* highly on the enterprise it had shown in the collection of its war news, and acknowledged that the *Daily News* did *not* get its account of the battle of Gravelotte from the London correspondent of the *Tribune*. The question then arose, of course, where did the *Tribune* get it? Whose "special correspondent" was he who furnished it? But this has never been explained, and the public is as much in the dark as ever. The *Tribune* avers, however, and we have no doubt truly, that it *has* correspondents employed and paid by itself at the seat of war, and its news received by them has undoubtedly been very accurate and valuable, and been accompanied in its columns by very useful and perspicacious comments.

Here, however, comes in a new complication. The rules of the Associated Press are, that every news despatch, with two or three exceptions which do not apply in this case, addressed to any one member of the Association, must be by him offered to all the other members, who are at liberty to publish it, in whole or in part, as they please, paying for it in proportion to what they use. Any member who employs a special correspondent anywhere, employs him subject to this rule. Whatever special correspondents the *Tribune* has employed in Europe it employed subject to this rule—a fact which undoubtedly heightens the credit to which it is entitled for employing them, inasmuch as it was sure not to get all the commercial advantage of their letters, and could only obtain from its fellow-members the cost of the telegraphing, leaving the correspondents' salary and other expenses to come out of its own treasury. Now, what would Solon, or Socrates, or Marcus Aurelius, or the learned and judicious Hooker, or Dr. Channing, have done had he been engaged in the conduct of a daily paper under these circumstances, in order to get from the public the honor and money to which he thought himself justly entitled as the reward of his enterprise? Why, he would have published a short statement of the rule of the Association, showing why the despatches received by him from correspondents of his own choosing came to appear in the other papers, and then left the public to form its own conclusions. In this way, he would have got all he wanted, or deserved, for himself, and would have avoided casting any imputation on his professional brethren—the rule being one which has been adopted, it is to be supposed, for their common benefit; and would have supported his preachings to the public by an example of candor, strict accuracy, and good taste and good feeling. But what the *Tribune* did was to conceal all knowledge of the rule from the public, and publish a notice calling attention to the fact that its despatches appeared regularly in the columns of its rivals in an "imperfect form," and so worded as to leave on the popular mind the impression that its news was wantonly stolen by its contemporaries, who picked out of it what they pleased, and then impudently presented it as their own.

The *Sun*, apparently as a set-off to this assumption, and one or two other papers, published these despatches as coming from their "Special Correspondent," the unfortunate man being thus claimed as "special" by five or six different newspapers, which led, of course, before long, to a regular bout of abuse—the lie by implication, and, once or twice, the lie direct, being fairly exchanged—and the formal part of the controversy being accompanied through the whole summer by boastings, braggings, taunts, shouts of defiance, and loud-mouthed depreciation and ridicule of their neighbors' wares, and exaltations of their own, all in close imitation of a game of chaff between three or four "Cheap Jacks" in a fair—every word suggesting the unpleasant inference that the members of the press deal with each other, in all business matters, not simply at arm's length, as ordinary business men do, but as blacklegs or professional gamblers may be supposed to deal with each other, with pockets buttoned tight, a revolver within easy reach, and with ready access to a window looking out on the street. Now, nobody would perhaps have a right to ask the gentlemen engaged in this wretched business to mend their manners if they did not preach so much; but their preaching, as we have said, makes their mode of transacting business rather ludicrous. What is perhaps worse than this is that their business relations with each other, as described in their own columns, make much of their preaching, if not ludicrous, to a great and increasing proportion of the public as ineffective as the idle wind. They furnish people with an excuse for not heeding their admonitions, and make their strength lie more and more in their denunciations; and this not so much because these denunciations injure people in the estimation of their neighbors, as because they annoy them in the small way in which one is annoyed by being shouted after or hooted by a rowdy in the street. Moreover, the exhibition the Association has been making of itself gives a strange character to the obituary notices of journalists published by their professional brethren. The public then learns that the poor villain, of whose lies, misrepresentations, tergiversations, and cheatings and indecencies they had been hearing for so many years, was really a very "high-toned and cultured gentleman," of "fine talents and dignified manners," with the kindest of hearts and the loftiest aims and noblest professional ideals. The men whom he cheated and lied to also bear his pall at his funeral, and would, if called upon, make an oration at his grave, as well as write an article in their paper, testifying that they never expected to see on this miserable earth a purer or better editor or man. Surely this state of things might be mended with advantage to that much-belauded but also much-laughed-at "profession of journalism."

POPULAR NOTIONS OF PRUSSIA.

To know and to understand Prussia and her politics is by no means easy. No wonder if the French have failed in the task. With the exception of her Rhenish provinces, Prussia lies outside the beaten track of tourists. Paris, Switzerland, Italy, and even the region called Germany in Bradshaw, can all be reached by roads not "royal" and not Prussian, and as to the Rhineland, where Electors ruled, even in Vivian Gray's time, it has not been Prussian long enough to have become a fair representative of the "Royal Prussian" type. The consequence is that foreigners have hitherto derived their notions of Germany exclusively from the more frequented southwestern parts of that ethnographic region, and altogether irrespectively of Prussia, which is obviously its most important part. Thus, for instance, the ugly sounds popularly regarded as typical of German speech were all borrowed from the Suabian dialects, and Austria seems to have monopolized the exportation of damaged vowels into Italy. The German character, too, and German manners have generally been judged by the same southern and western specimens. It is true that Dresden has allured a small Anglo-American colony, whose notions concerning Germany must indeed very considerably differ from those which have become stereotyped among the tourists on the Rhine and in the Black Forest. But the number of these colonists is too small to influence public opinion, and, after all, Dresden is but an *Ultima Thule* to them. Who ventures beyond safe, respectable Dresden? Some may take a trip to Berlin to see its lions and return for supper, others may see it in passing through. But few indeed are those that make the Prussian capital their headquarters for a season. Prussia thus remains a *terra incognita* to foreigners. The few notions concerning her which have obtained currency abroad are either incomplete or erroneous, and as they are far from being flattering to Prussia, they were not apt to induce further enquiry or tempt to personal inspection. Recent events have made it probable that the Germany of the future will not only embrace and absorb Prussia, but that it will, in its turn, be powerfully affected and modified by this assimilation. In other words, the resultant of the new combination will lie much nearer to the Prussian type than to the hitherto so-called German type. We cannot determine this resultant yet, which is a thing of the future. But its Prussian component, which has so suddenly forced itself upon the attention of the world, is the more worthy of our careful study and attention, as it may soon have to vanish again from our sight to undergo the cycle of its metamorphoses. It is well, then, to study the caterpillar before it turns chrysalis.

It often happens, in the non-scientific world at least, that the thing unknown, if we are not allowed to ignore it, becomes unpleasant to us. We then revenge ourselves for its obtrusiveness by either disliking or ridiculing it. And these two terms express with tolerable completeness the world's sentiments toward Prussia. All that was known about Prussian manners, customs, and institutions was, in the eyes of the "intelligent foreigner," either odious or ludicrous, and what was not known was not worth knowing. We need not enumerate here the many national oddities which are known to be German rather than specifically Prussian. The disregard for appearances, the clumsy tailoring, the architecture of the German bed, the dearth of blankets and the scantiness of the sheets, the eating with the knife, the partiality for beer, tobacco, *Wurst*, and *Sauerkraut*—and, above all, certain modes of speech, half-meaningless, half-quaint—have, from time immemorial, amused and sometimes annoyed sensitive foreigners throughout Germany; and Prussia, being German, is of course not free from any one of these peculiarities. But she has, in addition, certain traits of her own which seem to strike foreigners, nay sometimes even natives, as unaccountably ludicrous. These traits are the natural results of her growth and her history. We must not forget that Prussia was very young and very small when she was raised, in 1815, to the rank of a first-rate power. Not only was she viewed as an upstart and a political parvenu, but she could hardly help behaving like one, were it only to show herself worthy of her new rank and position. Her diplomacy became pompous and meddling, her administration red-tapish and harsh. The principle of authority, the king's authority, was asserted everywhere, at all times and in every transaction of civil or political life. Every road was a royal road, every theatre the king's theatre, every schoolmaster a royal official. In fact, Heine could not find anything that was not royal in Prussia, and learnt at last to enjoy even "the royal Prussian evening air" at the seaside.

Why the *Zündnadelgewehr*, that famous needle-gun which struck down Austria in seven days, should ever have been the laughing-stock of Europe, it is difficult to understand; yet it is a fact that before 1866 one could not mention that weapon without provoking a smile or a shrug. The word may have sounded odd and ludicrous in foreign ears, but the word and the thing could easily be separated; and that no European nation ever thought of investigating the merits of the invention or tried to imitate the weapon, shows more than anything else both Europe's contempt for Prussia and Prussia's single-mindedness.

The very shape of Prussia, the geographical outlines of her disjointed territories—her wasp's waist, as it was called—continued for many years after the Congress of Vienna to be a favorite subject for satire and derision, and it is not impossible that the cause of this "wasp's waist," the gift of the Rhenish Provinces (in preference to Saxony, which Prussia coveted) was intended by the Danaï of the Congress to be a fatal gift to Prussia.

But these singularly short-sighted statesmen forgot that if want of compactness weakens a country in a military sense, it also enhances its commercial and intellectual capacities, which, according to Ritter, grow with the increase of peripheric contact, and must be greatest where the boundaries of a country are longest in comparison to its bulk. Moreover, the gift involved, and was by the recipient understood to involve, a political mission. Anybody but a diplomatist would have seen that this mission was the "watch on the Rhine," and that Prussia would undertake it, undaunted by the magnitude of the task and by the Catholic prejudices of her new and by no means patriotic citizens.

As to Prussia's habitual want of popularity, it is one of the most curious phenomena in modern history. Prussia has invariably been disliked not only by her enemies but by her very friends and allies. The Poles, of course, hate her (and who would blame them for that?), but even the Russians dislike her, notwithstanding the intimacy and relationship of the two sovereigns. So do the Austrians, so did the Bavarians and Würtembergers, the Dutch and the Danes, the English and the Italians, and their dislike seems to have nothing to do with political jealousies or grievances. Nor do the French form an exception to the rule, although it is but fair to say that before the war at least there was nothing personal even in their *chauvinism*. There must, of course, be some real and tangible reason for all this. It is natural enough that, when once a prejudice exists against a country, the stranger who visits or traverses it can rarely be in a proper condition of mind for steering clear of difficulties and scrapes, and these difficulties will enhance rather than correct his prejudices. But we can hardly call prejudice a natural aversion to what must appear forbidding and ungenial to everybody not rendered callous by life-long habit. The bureaucratic hardships of Prussian officials, and the rigid compulsory method with which Prussia enforces the acceptance of her gifts and her protection as well as of her burdens, are certainly not calculated to beget good-will, and we can hardly wonder if Prussia enjoys the strange distinction of being disliked by a good many of her own people who would willingly allow themselves to be educated, vaccinated, taxed, and drilled, but who either object to the official *modus operandi* or are anxious to sell their obedience for a fair measure of constitutional rights. The parliamentary struggle in Prussia and the apparent "separatism" of the southern states of Germany, can only be rightly understood by the light of this fact.

A great deal, however, of the actual dislike that is felt towards Prussia is unquestionably due to a certain want of knowledge on the part of her critics. Hegel almost hated Prussia, but ended by discovering in her the embryo of his model state. Nor are strangers much to blame for their mistaken notions. Prussia teems with contradictions and contradictory elements. Her crusty surface hides the softest core. Thus, haughtiness and modesty, harshness and good-nature, centralization and individualism, positivism and transcendentalism, religion and materialism, feudalism and social equality, stern frugality and intense love of pleasure, home-life and gregariousness—coexist in this country in bewildering confusion. How perplexing all this is may be inferred from a little volume recently published by a correspondent of the London *Times*—himself a Prussian—on "Religious Thought in Germany." The observations of this writer are quite correct, and his facts and statistics scrupulously accurate; but we must dispute his conclusions, as we cannot help doubting the completeness of his premises. It may be easy to understand the religious ideas and habits of the Roman Catholics in Southern and Western Germany. But to understand the religion of Berlin or of Königsberg is, it must be granted, a very difficult problem. The Prussians are not church-goers. Their Protestantism has, in fact, long ceased to be Christian, except in that neoplatonic sense in which even Hegel professed to be a Christian. But, however puzzling and perplexing this may be, it is nevertheless true that the Prussians are an eminently religious people. Schiller says:

> "What religion I have? None, surely, of all you may mention.
> And what keeps me aloof? Naught but religion, of course."

German school-boys find nothing extraordinary in this distich, though an English reader might be pardoned for misinterpreting such sentiments. How a nation which sees nothing but a truism in these lines could ever produce and then tolerate among its rulers such men as Eulenburg and Mühler, is another enigma which occasionally seems to puzzle even the Prussians themselves. But the most perplexing incongruity of all is the fact that a nation so utterly destitute of ambition, so indifferent to glory and prestige, and so averse to war, finds itself so often engaged in doing ambitious work. To foreigners this is a real stumbling-block, on which not only their affection but even their logic is apt to break down. Hence, Schleswig-Holstein was "conquered," they say, but Lombardy was "annexed," although the two cases were juridically identical.

In a nation, as well as in an individual, the coexistence and wild alternation of contradictory and seemingly incompatible traits may fairly be set down as a sign of youth and of rapid growth. Everything in Prussia—her statistics, her manners, her traits, and her attributes—betrays a rapid development, a quick succession and frequent overlapping of intellectual phases. There exists a certain provincial and slightly slangy term, quite peculiar to Prussia proper, which is applied with ludicrous liberality to everything not coming up to the spirit of the age. A pig-tail, for instance, would be called "a standpoint overcome"—"ein überwundener Standpunkt." You cannot pass many hours in Prussia without hearing this curious expression. Your stationer may dissuade you from buying sealing-wax on the ground of its being "a standpoint overcome," and the same term would be applied to muzzle-loaders, to passports, to Wolff's logic, and to Goethe's "Farbenlehre." They are all things of the past, outgrown and outlived, and the rising generation looks down upon these former "standpoints" as an Alpine climber looks down from the *Grands-Mulets* upon the lower cliffs that once seemed towering far above him. Prussia has, strange to say, not yet included the two-pronged fork in her long "Index" of worn-out standpoints, nor even the two featherless bipeds which still disgrace the Bismarck ministry. But the great popularity of the term in question betrays a certain fastness in the Prussian people which is sure, ere very long, to "overcome" southern sluggishness, and to "outgrow" its own oddities.

NOTES ON THE WAR.

THE DEFENCES OF LYONS.

If our recent information respecting the movements of large masses of Prussian troops in the direction of Lyons be true, that city will soon be an object of public interest but little inferior to that of Paris.

With but little to attract the mere travelling public to it, Lyons is comparatively but little known except to persons engaged in commerce. To the world at large, it is best known for its manufacture of silks and of other products of the loom, and for the ultra-democratic spirit of a portion of its population, in which and in their revolutionary movements, they have rivalled the like classes in Paris.

Being one of the great centres of population, and a point of convergence for all the principal lines of communication between the north and south of France, Lyons, in a military point of view, is of great strategical importance. With Paris and Strasbourg, which are nearly on the same parallel of latitude, Lyons forms the apex of a nearly equilateral triangle, of which the other two cities are the base, having sides each of about two hundred and fifty miles. On the lines of communication connecting it with Strasbourg lie the important places of New Brisach, the fortifications of which Vauban regarded as the *ne plus ultra* of his art, Belfort, and Besançon; and the main roads from Marseilles, Toulon, Chambéry, and Geneva to Paris run through it. The importance, therefore, of its occupation by an invading force, particularly one already holding Strasbourg, will be obvious even to the non-professional eye.

Lyons is chiefly built on the tongue of land, somewhat less than half a mile in width, lying between the Rhone and the Saône, at their junction, which here, for about two miles and a half, run nearly parallel to each other, and a little to the west of south. The entire length of the city from its southern point, including the suburb of La Croix Rousse on the north, which is mainly occupied by the operative classes, is somewhat over four miles. The portion of the tongue of land on which this suburb lies suddenly widens to over a mile, between the two rivers, by an abrupt turn of the Saône to the east before it resumes its southerly course to its junction with the Rhone. This forms a kind of plateau on which the suburb of La Croix Rousse lies, being about two hundred and ninety feet above the level of the Saône here, and descending by steep declivities to the two rivers and to the city, which, at its central point, is about thirty-six feet above the river, the surface descending by a gradual slope from north to south.

On the east bank of the Rhone are the two suburbs of Les Brotteaux and La Guillotière, the ground upon which they lie being undulating, and at no point much over seventy feet above the level of the river.

On the west bank of the Saône are the suburban villages Vaise, Fourvières, St. Irénée, and St. Foy. These are situated upon an undulating plateau that rises quite precipitously from the Saône, varying from seven hundred feet, the highest point of the crest at Fourvières, to about three hundred feet at St. Foy to the south of it. From the crest, which is only between four and five hundred yards back from the Saône, the plateau descends with a more or less undulating surface, towards the west, to the small river Yzeron, which flows into the Rhone about a mile below the city.

Looking to its military importance in case of invasion, and also to the revolutionary and turbulent character of its population, which has received several severe lessons in being forced to terms of submission by actual bombardment, the government has, from time to time, added to the natural strength of Lyons by fortifications. The oldest of these is a bastioned line, thrown across the tongue of land between the Rhone and the Saône, on the crest of the plateau on which the suburb of La Croix Rousse stands, and between it and the city in its rear. At about twenty-five hundred yards to the north of this line, and on the same plateau, are two detached forts, Fort Caluire and Fort Montessay.

The suburbs on the east bank of the Rhone, and the city on the opposite bank, are covered by a system of detached forts, commencing at a point opposite the east end of the fortified line on the north of the city, and running back about fifteen hundred yards from the Rhone, and then running south to join the river again at about three thousand five hundred yards below, at a point called La Vitriolerie. Upon this curve-like line are situated nine detached forts, named, commencing at the north, Fort St. Laurent, Fort La Fête d'Or, Fort Charpennes, Fort Les Brotteaux, Fort La Part-Dieu, Fort Villeurbanne, Fort La Motte, Fort Colombier, and Fort La Vitriolerie. These forts are intended to be connected by an intrenched line.

The high ground on the west bank of the Saône, extending from a point opposite the west end of the fortified line on the north to the village of St. Foy, opposite the southerly portion of the city, is also occupied by detached forts, and a part of it by an unbroken fortified line in their rear. The detached forts are Fort Vaise on the north; next Fort Loyasse, which occupies the highest point of the ground; next Fort St. Irénée; and the most southerly Fort St. Foy. The part of the ground here which is enclosed by the fortified line is the plateau which lies between the Saône and a valley that runs up between the villages of Fourvières and St. Irénée—the fortified line itself extending along the outer or western crest of the plateau, from Fort Loyasse to the river bank, back from the village of St. Irénée.

Upon whichever side of the city an assailant might attempt to carry on siege operations he would encounter great difficulties from the nature of the ground; that on the north presenting a very narrow front of approach; that on the west bank of the Saône being broken and precipitous; whilst that on the east bank of the Rhone, though offering few engineering difficulties, is commanded within short range by the high grounds on the west bank of the Saône.

West Point, Oct. 11, 1870.

ENGLAND.

London, Sept. 30, 1870.

Once more I feel it almost impossible to begin a letter devoted to the affairs of this quiet little island without apologizing for the supposition that your readers can possibly take an interest in anything so quiet and humdrum amidst the tremendous convulsion which is now distracting Europe. We rise in the morning and discover an obscure paragraph or two in the *Times* from which it seems that the great catastrophe of the Pope's temporal power, so long delayed and so eagerly anticipated, has at length occurred; and we scarcely condescend to pay it any attention. The mere wind of the tremendous blows struck upon French territory has sufficed to sweep away an ancient and venerable power—and its fall attracts next to no interest. How at such a time am I to induce you to read remarks upon the British Association, or Mr. Bruce's address to his constituents, or the election of Mr. Alderman Dakin to be Lord Mayor of London? I once heard a gentleman suggest that the best mode of saving a drowning man was to distract his attention by conversation on indifferent topics; and it really seems as if I was attempting a feat of equal difficulty. Yet, after all, we rise every morning and consider what we shall have for breakfast, and grumble if our tea is cold or our eggs are underdone, as though no hospitals were crowded with mutilated soldiers and the Prussian army were not looking down upon Paris. I will be content, then, with remembering that in presence of the most awful events we can still be moved by trifles, and will endeavor to set before you such a meal as can be furnished from the petty events of our English life, without troubling myself in future to justify such an apparently heartless proceeding.

Let me begin, then, by the first of the topics which I mentioned as beneath the notice of any reasonable man at such a moment as this. Those queer little mock-parliaments, the British Association and the Social Science Association, have been holding their annual meetings in spite of wars and revolutions. They wisely select that time of year which is generally rather barren of interest, in order that they may have a better chance of securing the attention of the public. In fact, newspaper editors are only too glad under ordinary circumstances to fill their columns with the discursive eloquence provided on these occasions. At Liverpool, the meeting-place of the scientific gentlemen, there was some chance of a more than usually vigorous display. Prof. Huxley was the chairman for the year; and he is a gentleman who generally makes his blows tell. He is one of the very best lecturers in England—animated, uncompromising, and possessing a racy style and considerable oratorical power. Moreover, it is impossible to look at him or hear him speak without recognizing the genuine pugnacious temperament. He is an intellectual gladiator, who is never happier than when he is riding rough-shod over the cherished superstitions of his adversaries, and who fights in the true bull-dog style, neither giving nor taking quarter. Of his eminence in a scientific point of view I am not qualified to speak, but I imagine that it is well enough recognized to justify silence. We might therefore look forward to one of those gallant "rough-and-tumble" encounters (to use the language of the prize-ring) in which the descent of men from monkeys or some kindred topic has often excited so admirable an outburst of scientific and theological hatred—surely the most explosive compound hitherto discovered. For a wonder, however, the professor was pacific. He discoursed upon the theory of germs, and, though provoking some little spurts of controversy, kept on the whole upon tolerably neutral ground. At the conclusion of the meetings he stated that he had been regarded by some people as a kind of scientific gorilla, who was not quite safe in civilized society. He added, with justifiable pride, that their anticipations had been disappointed; and in fact he behaved as quietly as though he had been accustomed from his youth to handle all things with white kid gloves. To say the truth, Prof. Huxley discharged his duties admirably, and showed his usual common-sense in disappointing any expectations of a disturbance. The only other event of the meeting was an address from Prof. Tyndall on the scientific use of the imagination, on which the general criticism has been that it was rather imaginative than scientific. That, however, is a matter which lies beyond my province.

The calmness of the British Association was more than equalled by their rivals, who are devoted to what is called social science. They had indeed adopted an admirable plan for securing decency and decorum. They elected for their chairman the Duke of Northumberland, for social-scientific persons have a certain liking for the aristocracy. His grace gave them a thoroughly ducal view of their favorite study. He explained in a general way that we were living in a very bad time, owing to the extreme follies of certain persons who about eighty years ago took it into their heads that the world could do without dukes. Although their base designs did not completely succeed, and this island in particular was still blessed with a fair share of dukes, it was a lamentable truth that dukes exerted a good deal less influence than formerly. The great object of the Social Science Association was to discover the remedies to be adopted in a dukeless world, in order more or less completely to obviate the evil consequences of our dukeless condition. I am not quoting the admirable language in which these sentiments were conveyed, but seeking to convey some of their spirit in a necessarily imperfect paraphrase. I have not the presumption to criticise such philosophy, for a commoner can hardly be expected to appreciate its full force. I may however remark that the lamentation seems to be a little exaggerated. When we find that a number of persons, who claim to be philosophical reformers of all social evils, have so lively a sense of the value of the ancient title as to elect the Duke of Northumberland for their president, and to listen respectfully to his ducal philosophy, we cannot but hope that the respect for dukes has not so completely died out of the land as his lamentations would lead us to suppose. At the bottom of their hearts our philosophers still cherish a warm affection for those ornaments of our native aristocracy. As for the speaking which followed this lecture, I really cannot trespass upon your patience to give any account of it. It was the regulation talk on such occasions, and consisted principally of two elements. One is that kind of matter which naturally proceeds from a dilution of blue-book and parliamentary eloquence. It is like a commonplace sermon from which the texts have been extracted and their places filled with statistical tables. The other element is a certain quantity, fortunately not very large on this occasion, of that shrieking and hysterical declamation for which the Contagious Diseases Act and other like topics generally afford a pretext. The result is not exhilarating; and the natural concourse of people who can't get a hearing anywhere else to a place where everybody has a right to be heard, causes the voices of the more reasonable participants in the discussion—and there are many participants far better worth hearing than the ornamental president—to be rather frequently drowned. I will just remark in passing that one serious political inconvenience at the present moment is that our radicals and reformers generally are in very great want of a really worthy leader. Since Mr. Bright's retirement into the cabinet, there is no one who can be the mouthpiece of the more thoroughgoing reformers and who is at the same time a man of such cultivation and ability as to impose respect upon their adversaries. We have for the most part either mere windy ranters, or very worthy but very dull and unimaginative prosers. Mr. Mill has indeed some of the necessary qualities in the very highest degree; but I cannot honestly say that Mr. Mill in the sphere of practical politics comes up to Mr. Mill as a philosopher. He has a little too much of the excitable and feminine elements, and is too much inclined to adopt the crude fancies of his associates.

Another voice has lately made itself heard. Mr. Bruce, the Home Secretary, has been making two or three speeches, and there is something almost pathetic about them. He says, and it is quite true, that he has been denounced as the most incapable of the existing ministry, and as a thorough and unmitigated failure. He denies in very good-tempered terms that he is incapable or a failure, and especially affirms that he was quite right for letting off two criminals whom the public wished to send to the gallows. So far, he may very likely be right, and there is also some truth in his remark that the Home Secretary has a very unpleasant and thankless position. Unluckily, Mr. Bruce gave his ideas about our foreign policy, and they were certainly not of a dignified order. He said that we had done all we could to preserve peace—which may be true, but then it certainly did not amount to much. As for the need of gaining more respect for the English name, he confessed that we were not quite able at present to meet Prussia on equal terms—rather a mild way of describing the fact that we could by no effort produce an army abroad equal to a tenth part of the Prussian forces. However, he added that as Prussia was victorious and France completely smashed, we need not be afraid for the future. This mode of congratulating ourselves on the defeat of our neighbors will certainly not excite their gratitude. But, in a mere national point of view, it is rather annoying to find that one of our ministers is so completely blind to the lessons of the war, that he is so thoroughly convinced that all that is wanted is a little more patching and tinkering of the volunteers and the militia, and that he takes so inadequate a view of the possible contingencies of the future. Mr. Bruce is, I believe, a very amiable and excellent man; but we could certainly wish that the burden of administration in these days rested upon rather more powerful shoulders.

The course of my remarks has led me again within sight of the war, and perhaps it is as well that I should conclude for the present. I will merely notice a fact which is illustrative of the interest taken in passing events, and which in its way is without precedent here. The Society for the Relief of Sick and Wounded has received subscriptions already amounting to considerably over $1,000,000. There seems to be some difficulty, as indeed might be anticipated, in turning this sum to the best account; but on the whole we may hope that it will do some good, and it is at any rate a remarkable, and I think creditable, exhibition of sympathy for the terrible sufferings of the war.

Correspondence.

THE PRUSSIAN MILITARY SYSTEM.

To the Editor of the Nation:

Sir; In recent numbers of the *Nation* I have seen it repeatedly asserted, directly or by implication, that the Prussian army, in time of war, absorbs the best part of the male population; that it contains men from every profession and pursuit, in about the same proportions in which they are found in civil life; that, consequently, while the war continues, society stands paralyzed, the wheels of progress are blocked, and the horrors of war, by being compressed into a short period, are much mitigated and are less disastrous to civilization. On the other hand, a late article in the *Pall Mall Gazette*, entitled "How to Fight the Prussians," takes issue with this view, and explicitly states that the condition of affairs, which you take for granted as a proved fact, exists only in the imagination of newspaper correspondents. The article in question sets out with the admission that the rapid and numerous victories of the Prussians over the French are, in the main, due to the superior military organization of the former, but denies that this organization is what it purports to be on paper, or what it is represented to be by ardent writers for the press. It is denied that all able-bodied men are really taken into the service at the age of twenty. Only a fraction of them really enters the service, for the exchequer could never bear the burden if the whole male population, at any given age, were kept under arms for two or three years at a time. Such a system could only be actually carried out where the term of service was restricted to six months, which would be an ample period for converting raw recruits into well-drilled troops, and in this way the whole capable male population of a nation could be converted into a latent army. The people who will adopt a method approximating to this result, which the Prussian system is very far from reaching, will be as easily victorious over the Prussians as the Prussians have been over the Austrians and the French. So far the *Gazette*. Now, here is a direct contradiction, from a highly respectable source, of a series of premises and deductions which you have made the key-note of all your writing on the war, and which crops out in every department of your paper, as only a dominating idea can. My object in writing these lines is to obtain from you a brief summary of the facts on which you base your conclusions, which I was at first inclined to accept without question, but which, on second consideration, do not appear quite warranted. Thus, I have nowhere read that any Prussian newspapers have intermitted their publication, or curtailed their dimensions; that the courts of law have suspended their sittings, or the universities their courses; that bankers, manufacturers, or merchants have interrupted their dealings, all of which events, and many more similar ones, would have to happen with conspicuous frequency if an appreciable number of editors, printers, compositors, type-founders, lawyers, judges, professors, tutors, students, bankers, merchants, clerks, or skilled artisans were shouldering their needle-gun. A factory like Krupp's no doubt now employs twice the number of men it usually has any occasion for. Importers in this city find no difficulty in getting German goods which is not ascribable to the blockade of ports that are only just reopened. Of course, it would be foolish to deny that Prussia suffers greatly, but she suffers just as other nations suffer in time of war, because a large mass of men cease to be producers and become destroyers of wealth, and because an important outlet for her merchandise is cut off. But, as far as her army is concerned, a close examination would, no doubt, disclose that, like all other armies, it is principally composed of loafers, roughs, restless, reckless, shiftless, dissatisfied, unsuccessful men, who hail with delight a conjuncture like the present. It may be that the Prussian loafer shares in the general culture, and is superior to the loafer of other nationalities; and it is no doubt true, as it was in our war, that there is an infusion of the best citizens which, like the lemon in a bowl of punch, serves to flavor the punch, but is not missed from the stock of lemons. But when you seriously assert, as you do this week, that "Prussia to-day counts among her soldiers nearly all of her leading men in every walk of life, whether statesmen, financiers, men of science, or scholars," what can a gentle reader do but cry out "Name, name"? Give us the names of say two statesmen, three financiers, one man of science, four scholars, who are serving in the army. We should likewise be pleased to learn that there are a few able editors and some members of the chambers, who are probably your metaphorical railway directors on the cow-catcher. And then you might inform your numerous admiring readers what the Prussians are going to do for bread to eat, clothes to wear, coal to burn, and other necessaries of life, to say nothing of the luxuries, if the whole nation, exclusive of women, children, cripples, and your correspondents, is going to spend the winter in France, as it seems likely the whole army is going to do? And if the nation is in such a plight, when uniformly and marvellously victorious, how would it stand if fortune favored the other side? It almost seems that the old-fashioned way is the best.

Yours, respectfully,
A. T.

New York, October 16, 1870.

[The *Pall Mall Gazette's* suggestion is not half as valuable as it seems. No nation that undertook to fight the Prussians could bring under any system any greater force into the field than the Prussian system brings in proportion to population. Prussia brings into the field whatever force may seem *necessary* to overcome the resistance with which she has to deal. She has now under arms, and in France, or in fortresses, about 700,000 men out of a population of say 30,000,000, which includes the regular army (300,000 men), and as much reserve and landwehr as the case seems to call for. If a million of men are needed, they will certainly be forthcoming. It is strictly and literally true that "nearly all her leading men in every walk of life are soldiers." They are in one or other of her military branches. If they are under thirty-nine years old, they are actually in the army, or reserve, or in the first or second ban of the landwehr. The regular army only takes 100,000 men every year; the remainder of the physically-qualified young men who have reached the age of 20 pass into the first ban of the landwehr. But the Prussian system does not force it to call every man *to the field* when war breaks out; it would be a very foolish system if it did. Nearly every district contains more men than are needed for the battalion at its full strength. The able-bodied surplus stays at home; there stay at home, also, men of weak physical constitution, good enough for civil pursuits, but not good enough for military service; and, also, unless in case of invasion, all men over thirty-nine. Under this age, every man physically capable is either called to the field, or *liable to be called if wanted.* Men over thirty-nine, however, can do a great deal of work, and do do most of the nation's head-work. Men incapable of bearing the fatigues of a campaign are quite equal to the duties of an office or factory. It would be, of course, an exaggeration to say that Prussian industry is completely arrested while war is raging; but it is not an exaggeration to say that it is greatly disorganized. For instance, when the present war broke out, 4,800 clerks were at once taken from the post-office, and the mail service nearly went to pieces. The Postmaster-General made his representations, however, and got his men exempted as Government servants; but the same sort of thing happened in all the private offices in the country, and for this there was no help. Employers had simply to do the best they could—that is, get men past the age of military service, or foreigners, or women. Krupp probably keeps his men, because he is making ordnance for the Government. The senior classes of the universities are broken up. The head of a banking-house would be perhaps exempted if he showed that serious *public* detriment would result from his absence, but not otherwise, and nobody can grant an exemption but the Minister of War. "A. T.'s" supposition that the Prussian army is composed principally of "loafers, roughs, restless, reckless, shiftless, dissipated, and unsuccessful men," is simply a wild mistake. The army is composed of this class of men in just the same proportion as Prussian society is composed of them. A "close examination" would disclose that it was as unlike all other armies as possible for two reasons: one is, that in no other country is *every man* liable to military duty, and *actually enrolled* and drilled in a certain battalion, under a certain commander, during nineteen of the best years of his life; the other is, that substitutes are not allowed. If a deacon wants to pay a "loafer" to do his fighting for him, he finds that he can't; he has to march himself if wanted. We refer in another column to six Sanskrit scholars, one a Berlin judge, serving in the army. We are unable to mention at this moment the names of "two statesmen," or "three financiers," but will undertake to mention say six financiers and four statesmen—that is, men of distinction in politics, either as writers or orators—and two men of science, as soon as we can make enquiry. We confine ourselves to doubling "A. T.'s" numbers simply as a matter of convenience.—Ed. Nation.]

Notes.

LITERARY.

Messrs. J. B. Lippincott & Co. have in press the following works not previously announced: "In Exile," a novel from the German; "Dorothy Fox," a novel; "The Merman and the Figure-Head," a Christmas story, by Clara F. Guernsey; "Good Stories for Young People," by popular authors, with numerous illustrations; and "Counsel to a Mother," by Dr. Pye Henry Chavasse, in continuation and completion of his well known work, "Advice to a Mother."——The *American Journal of Science and Arts*, which now numbers one hundred volumes, in two series of fifty volumes each, will begin in January a third series, distinguished from the preceding by being issued in *monthly* numbers. The change is doubtless a wise one at a time when science in England craves even a weekly comparison of views and record of progress. One result of it should be a marked increase in the circulation of the *Journal* and among a new class of readers, the mere change from a quarterly to a monthly being in the nature of an approach to the general public. Professors Silliman and Dana, New Haven, are the editors and proprietors, assisted by Professors Gray and Gibbs, of Cambridge, and Newton, Johnson, Brush, and Verrill, of Yale. As hitherto, the *Journal* will be devoted to chemistry, physics, geology, mineralogy, natural history, astronomy, etc.; the subscription price will be $6 per annum.——We regret to announce the suspension for a year of the *American Entomologist and Botanist*, a monthly journal published at St. Louis, and very creditable to Western science, as well as practically useful to cultivators of the soil. The ill-health of the entomological editor is assigned as the reason of this suspension.——Macmillan & Co. will publish simultaneously in London and New York a new work by Dr. Maudsley, author of "Physiology and Pathology of the Mind," entitled the "Relation of Body and Mind," a subject even better calculated than the former to secure a wide reading both among men of science and among laymen. Other works that will shortly appear from the same house are: "Pictures of Cottage Life in the West of England," by Margaret E. Poole; "Tales of Old Japan," translated by Captain A. B. Mitford, of the British Embassy at Yeddo, with copious explanations and comments, and forty full-page illustrations drawn and engraved by Japanese artists; "The Iliad of the East," legends selected from the Ramayana, by Frederika Richardson; "Cowper's Poetical Works," in the *Globe* series, edited by Rev. W. Benham; "Handbook to Beethoven's Nine Symphonies," for amateurs, by George Grove; "Fine Art," its history, theory, practice, and application to industry, in a course of lectures delivered at Cambridge by Slade Professor Sir M. Digby Wyatt; "The Sun," by Balfour Stewart and J. Norman Lockyer; "The Beginnings of Life," by Prof. H. C. Bastian, who reviews the present state of the "spontaneous generation" controversy; an account of the late deep-sea dredgings under the auspices of Drs. Carpenter, Thompson, and J. Gwyn Jeffreys, called "The Depths of the Sea;" "John Wesley and the Religious Revival of the Eighteenth Century," by Julia Wedgwood; Professor Seeley's "Lectures and Essays;" "European History Narrated in a Series of Historical Selections from the Best Authorities," a good idea, which we owe to Miss E. M. Sewell and Miss C. M. Yonge; and, finally, but by no means least, Laufrey's "History of Napoleon I.," to be completed in four volumes.——*Patriotischer Frauen-Bazar* is the title which has been given to a journal to be published tri-weekly during the continuance of the German Patriotic Ladies' Fair in this city, which opened on Monday. Any one who subscribes to it or advertises in it will undoubtedly be lending aid to a most worthy object. Mr. Victor Precht is the editor, and the price of subscription is but fifty cents. Mr. Paul Cæsar, 9 North William Street, is the treasurer of the committee who have charge of the fair. Literary contributions may be dropped into the box at the General Post-office of the fair, Stand No. 20.

—It is too late for us to notice, except for hearty approval of its object, the meeting called by the General Committee of the German-American School Association for last evening. The public was invited to co-operate with this body "in forming an organization independent of national or party affiliations, so as to preserve our public schools from all partisan and sectarian influences, increase their usefulness, and perfect our system of education." Those who are acquainted with the ways of this city do not need to be told that this movement does not begin a moment too soon, that its mission will be not to prevent but to reform and cure, and that it must not expect support from the Democratic party or from Irish Catholics in this city or elsewhere. Meantime, we wish it the fullest success.

—There are many ways in which laymen might advance the interests of science by systematic records of events or phenomena within the range of their daily observation. Social science, in particular, would seem apt to be aided by statistics of this sort; and even housekeeping might be lightened of its burdens if the experience of the past could be tabulated for future guidance. Scientific men, however, have yet to set the example as completely as they might in their own practices. Comparatively few physicians, for example, make use, we suppose, of Dr. Edouard Seguin's "Prescription and Clinic Record" (New York: William Wood & Co.), although we are glad to notice it has reached a sixth edition. It is a pocket-book for the practitioner, and aims to give more precision and certainty to prescriptions, by writing them once for the apothecary and again for preservation; to substitute, more and more, positivism for conjecture in diagnosis and prognosis; to record phenomena on the spot and seriatim; and to treat complex or protracted cases with scientific unity of plan. These objects are attained by providing a hundred blank leaves for recipes, with counterfoils for copying the prescriptions, and noting the date, name, and age of the patient, his disease, pulse, respiration, and heat; and adding specific directions for the use of such valuable aids to positive diagnosis as the thermometer, the sphygmograph, the dynamometer, and the æsthesiometer, together with tables for recording the vital signs and physical signs, observations during the use of electricity, strychnine, etc., tables of appointments, individual summary, nosographical summary, and ambient temperature. It is easy to see what value for the physician's practice and for scientific generalization a number of such records, intelligently used, would have. The counterfoils would also serve a useful purpose, if any patient were obliged to remove to other parts, by being torn out and handed to him as a guide to his new physician in regard to his constitution, the kind of medicines he had had administered to him, their effect upon him, etc.

—The State Historical Society of Wisconsin, one of the most vigorous the country can show, added last year to its library the entire set of English Patent Office Reports—some twenty-five hundred in number—which will be continued at the rate of one hundred yearly. This year it has received from the Master of the Rolls his complete set of Chronicles and Calendars of State Papers, numbering about one hundred and sixty volumes. The library now contains fully forty-six thousand volumes, about half of which are bound. It is very rich in newspapers. From the Connecticut Historical Society we have the second volume of its Collections. It consists of Mr. J. Hammond Trumbull's paper "On the Composition of Algonkin Geographical Names," which we have already brought to the attention of our readers; papers relating to the controversy in the church in Hartford, 1656–59; and some very entertaining correspondence of Silas Deane's while delegate to the Congress at Philadelphia, 1774–76, and down to his going abroad to advance the interests of the Colonies in France. Deane's letters to his wife show that he carried his Connecticut yard-stick with him when he travelled, and he reports of the Philadelphians that "they look on me mad when I tell them that I have seen more good pasture, clover, meadow, oxen, and cows in a circle of three miles in Connecticut than is here to be met with in thirty; but it is true," he adds, "and every New England man in the company tells them the same." He was afterwards compelled by what he saw to retract this opinion, though he still had the satisfaction of decrying the city markets, in which he found only the mutton to commend. "In point of civility and hospitality, as well as frugality and economy," he thought Philadelphia much to be preferred to New York. At a fair, "when the whole country was collected," a brother delegate, "taking a guinea out of his pocket, says: 'Deane, here is a vast crowd of girls; I will follow you, and the first that you shall say has a pretty face, I will give the guinea to.' We strolled through the fair, and though I sincerely wished to make him lose the guinea, yet I could not in conscience say that I found one handsome face. From this, judge of the general complexion of females here"

—Mr. Thomas Hughes did not need, when addressing the Harvard students last week, to say a good word for muscular Christianity in that quarter, but his remarks on this head served as a pleasant introduction to what was to follow. The most noteworthy part of his speech was that in which he expressed his surprise and sorrow that among our young men there was such a marked distaste for public life, and contrasted this sentiment with that of similarly educated young Englishmen. The theme is one that would bear enlarging upon, being in fact but a part of the broader phenomenon, that respectable men of all ages are every year scarcer to be found having anything to do with politics, even so much as going to the polls. The disgust which lies at the bottom of this is natural, but apathy in the presence of so great evils is not lightly to be excused. The purity of our politics depends on each one's sense of the duties and responsibilities of the suffrage as an instrument of citizenship: the old ought never to forget this; the young cannot too soon be convinced of it.

—The Index to the forty volumes of *Harper's Monthly* appears close upon our announcement of it, and has evidently been prepared with great care and judgment. An article may be sought under its proper title, under the class to which it belongs, or under its author's name, if known; and, so far as we have tested the Index by cross-references, the search can hardly fail to be rewarded. Even the contents of such crowded departments as the Editor's Easy Chair and the Record of Current Events have been, in the one case, put in alphabetical order, in the other chronologically arranged, of course adding very much to the general value of the Index. Finally, each alternate page has been left blank for private indexing of subsequent volumes. We have gratified our curiosity in noting at random the names of the principal contributors to what is at once the most popular and, in its scheme, the most original of our magazines. Mr. G. W. Curtis, Mr. Alfred Guernsey, Rev. S. I. Prime, Mr. Donald G. Mitchell, and others, who have shared the editing of *Harper's*, we will leave out of view. Among the authors of the lighter stories which the reader has learned to expect with every number, we recognize Miss Louise Chandler Moulton, Mrs. Harriet E. P. Spofford, and the late Fitz James O'Brien, as among the most prolific; along with Mr. Charles Nordhoff, Miss Caroline Cheesebro, Mr. F. B. Perkins, Mr. J. W. De Forest, Miss Mary N. Prescott, and the Misses Cary—Miss Alice being much the more frequent. Rev. W. M. Baker, author of "Inside" and "The New Timothy," has written more or less, for the last twenty volumes, of short stories and serials. Mr. Justin McCarthy made good the time he spent here with *Harper's* as with the other magazines. Mr. Lossing, Mr. Headley, and Mr. J. S. C. Abbott have furnished history of unequal degrees of merit—the last-named writer, who must be now in doleful dumps, having begun with the first volume to write of French history, and with the third to sanctify Cæsarism. Mr. Strother ("Porte-Crayon") has written much and pleasantly of his excursions and adventures in this country, chiefly at the South; and Messrs. E. G. Squier and J. Ross Browne began early to narrate their experiences in foreign parts. Among the miscellaneous essayists have been Mr. Charles T. Congdon, Mr. M. D. Conway, Mr. H. T. Tuckerman, Mr. Bayard Taylor, Mr. Grant White, Prof. Tayler Lewis, and Rev. Samuel Osgood. The late Mr. Raymond wrote three articles, Mr. Greeley one, and Mr. A. Oakey Hall three—one of these three, published ten years ago, being called "Dinner at the Mayor's." On the whole, it would be difficult to make up a list of writers better calculated to please and edify the average American citizen.

—We cannot say that our imagination has yet lent such proportions to Chinese immigration to this country that we anticipate the time when, as our German fellow-citizens have secured German instruction in many of our public schools, so the Chinese-Americans will be clamoring for tuition in their "Muttersprache." That would imply the coming over of families without thought of returning to Asia, the rearing of children, the adoption of American usages, and a thousand other conditions which are as yet very far in perspective. Nevertheless, we cannot help observing that Professor Roehrig, at Cornell, has started off with a class of thirty-five in Chinese, out of which perhaps half-a-dozen will persevere to the end; and we may as well inform these progressive students that they may soon expect the aid of a dictionary of Chinese and English, of some 1,100 pages, which is in process of publication at Foochow, and is edited by Rev. C. C. Baldwin, of the American Board, and Rev. Dr. Maclay, of the Methodist Episcopal Mission. The Sunday-school teachers at North Adams who are engaged in christianizing Mr. Sampson's shoemakers will perhaps be glad to learn that this dictionary, it is hoped, will be particularly useful for missionary work. Another Chinese dictionary in one volume is announced by Trübner & Co., as European agents, to be in preparation by the Rev. Justus Doolittle, editor of the *Chinese Recorder and Missionary Journal*, who has bestowed great care upon the work.

—English announcements of forthcoming works are much more numerous than the war might have led us to expect, and the quality is scarcely inferior. In travels, we shall have "Notes during a Cruise among the South Sea Islands in H.M.S. *Curaçoa*," by Julius Brenchley; "Journeys in North China, Manchuria, and Eastern Mongolia, with some Account of Corea," by Rev. Alexander Williamson; and "Four Hundred Millions—Chapters on China and the Chinese," by Rev. A. E. Moule. In biography, the following: a translation of Baron Hübner's "Memoir of Pope Sixtus the Fifth," by Hubert E. H. Jerningham; a "Memoir of George Edward Lynch Cotton, D.D., late Lord Bishop of Calcutta," by his wife; a "Life of Isambard Kingdom Brunel," by his son; "Lives of the Lord Chancellors and Keepers of the Great Seal in Ireland, from the earliest times to the reign of Queen Victoria," by J. R. O'Flanagan; "Chips from a German Workshop," Vol. III., consisting of literary and biographical essays, by Max Müller; "A Condensed Universal Biographical Dictionary," with large claims, by L. B. Phillips; the sixth volume of the "Life and Writings of Joseph Mazzini; and "The Life and Times of John Wesley," by Rev. Luke Tyerman. In history, a translation of Wilhelm Ihne's "History of Rome;" the "Student's Manual of the History of India, from the earliest period to the present," by Colonel Meadows Taylor; and "The Historical Geography of Europe," by Edward A. Freeman. In poetry, we notice only a translation of Dante by Rev. James Ford; and, to be published in December, the concluding volume of Mr. Morris's "Earthly Paradise." Among scientific works of more than technical interest, we may name: "The Sun: Ruler, Light, Fire, and Life of the Planetary System," by

Richard A. Proctor; and a translation by two ladies, Jane and Caroline Lassell, of Dr. Schellen's familiar explanation of the "Spectrum Analysis in its Application to Terrestrial Substances and the Physical Constitution of the Heavenly Bodies." Art or artistic publications are sufficiently numerous: "Gems of Modern French Art" being sixteen large photographs of the masterpieces of the greatest French painters, with descriptive letterpress by W. B. Scott, M.A.; "The Book of Shakespeare Gems" containing forty-five magnificent steel plates in illustration of the most interesting landscapes connected with Shakespeare's plays; "English Painters of the Present Day" described in essays by J. Beavington Atkinson and others; "The Unknown River, an Etcher's Voyage of Discovery," by Philip Gilbert Hamerton, who gives forty-two etchings by his own hand; "A History of the Gothic Revival," by Sir Charles Eastlake; "Pictures of St. George's Chapel, Windsor," photographed by John Harrington; "Historic Devices, Badges, and War Crests," by Mrs. Bury Palliser, with 140 illustrations; "The Wonders of Engraving," by Georges Duplessis, with thirty-four woodcuts and ten photographs in autotype, illustrative of the historical progress of engraving; a companion volume, "The Wonders of Painting," by M. Viardot, embracing the Spanish, French, German, English, Flemish, and Dutch schools, with copious illustrations; and we suppose we may add under this head works notable chiefly for the illustrations, such as "Art in the Mountains—the Story of the Passion Play," by Henry Blackburn; "Longfellow's Poetical Works," including the "New England Tragedies," with 178 illustrations by John Gilbert; "The Story of Sir Richard Whittington, Lord Mayor of London," written in verse and illustrated with specially designed ornamental borders and initials, and eleven full-page drawings on copper; and the "History of Napoleon III., from the Caricatures of the Past Twenty-five Years." There remain to be mentioned, without classification: a translation by T. M. Lindsay, M.A., of Dr. F. Ueberweg's "System of Logic and History of Logical Doctrines;" a "Dictionary of Doctrinal and Historical Theology," by various writers, edited by Rev. J. H. Blunt; "The Earthward Pilgrimage," by Moncure D. Conway; a work by Mr. Hunter on the "Water Supply of Cities and Towns;" and a second series of "Misread Passages of Scripture," by Rev. J. Baldwin Brown.

— *Trübner's Literary Record* condemns with some warmth the protest which the five classes of the Institute of France have resolved to address to every academy in the world, in view of the possible bombardment of the monuments, libraries, and museums of Paris. It says that these objects are quite as sacred to the German armies as to the members of the Institute itself, and that the city need not fear to be treated as the French armies would have treated Berlin. It enumerates six very accomplished Sanskrit scholars who are now in the Prussian armies, and who "know the responsibilities which they owe to the world of letters probably better than the French *savants*, not one of whom had a word to say about the 'sacredness' of kindred institutions in Germany when the military promenade to Berlin was proposed with the loud acclamations of the 'gentlemen of the pavement' of Paris, and the silent approval of its learned bodies." One of the scholars mentioned was Doctor (Juris) von Thielmann, a junior judge in the Berlin Court of Appeals, an officer of the Hussars, who had fought in Bohemia in 1866; and the *Record* copies from the *Spener'sche Zeitung* an account of the battle of Sedan which he wrote to a friend in Berlin on the day following the victory. It is in "essentially correct Sanskrit," and reads as follows:

"SEDAN, 2 September, 1870.—Hyo mahâyud abhavat. Çatravah sarve nirjitâh, sarvâ teshâm senâ, mahârâjâ ca svayam, baddhâh. Tvashtâ no vajrâm svaryam tataksha; ahanmâ 'him svavîlau çiçriyânam (Rigveda i. 32).

"Aham sukuçalo 'smi; yuddhe na mahad bhayam gato 'ham, yad etasmin kshetre supârvate padâtaya eva yoddhum çaknuvanti, turanginas tu nâ 'rhanti. Mahatyâm sevâyâm bhavatah çishyah."

"Yesterday a great battle took place. The enemy was thoroughly beaten; their whole army and the great king (Maharâjâ, emperor) himself made prisoners. *Tvashtar* (Vulcan) forged for us the flaming thunderbolt; we defeated the *Ahi* (Python), who hid himself in his cave (Rigveda i. 32). I am all right; was not, during the fight, in great danger, because in this very mountainous country the infantry, not the cavalry, have to bear the brunt of the battle."

THE PROPOSED REVISION OF THE ENGLISH BIBLE.

II.

THE ENGLISH TEXT.

DOUBTLESS there are words altogether obsolete, infelicities of expression, and even errors of meaning, in the standard version, and hence there are certain changes which might advantageously be introduced into it. Not many would insist on retaining *car* for *plough* in the half-dozen cases where the revisors employ the former instead of the latter; not many would prefer "straining *at* a gnat" to "straining *out* a gnat," if these corrections were individually proposed; but the question of the expediency of a new recension, in the present state of our criticism and of our language, resolves itself into this: shall we, for the sake of changes like these, expose the whole version to a revision which may essentially alter its general coloring; or shall we trust to our mothers, our Bible-readers, and our other religious teachers, to bring the intelligence and the heart of the young, whom they initiate into the mysteries of Christianity, up to the comprehension of a sacred dialect not, indeed, so readily intelligible as a newspaper, but less obsolete than that of Spenser or of Shakespeare, and scarcely more archaic, except in mere grammatical forms which no one thinks of expunging, than that of Bacon? No new editor revises either of these profane authors for any other purpose than that of correcting the errors of early typography—no man capable of really enjoying even Chaucer, in any form, desires to see him in any other dress than that in which he clothed himself. Shall we treat a version of the Bible, admirable in itself and hallowed by so many sacred associations, with less reverence than the works of our narrative and dramatic poets and our philosophers?

But we are wandering from our proper theme, which is to enquire, not whether any revision at all is now necessary or expedient—a question prejudged by the authorities of one Province of the Anglican Church—but what are the requisite conditions for such an undertaking, and how far the plan proposed by the Convocation of the Archbishopric of Canterbury promises to fulfil them.

We endeavored in our first article to give the reader a general, though still inadequate, notion of the learning and labor involved in a thorough recension of the original text of the sacred Scriptures. But this task, vast and comprehensive as it appears, is, as we have before observed, both the least important and the least difficult of the two branches of the work indispensable for a satisfactory revision of the English Bible.

It is the least important, because the discrepancies between readings respecting which there is room for an honest difference of opinion among competent judges, are either relatively insignificant, or they respect passages in the text which might be rejected as spurious without essentially weakening the evidence in support of any of the doctrines which divide the opinions of Christendom.

It is the least difficult, because a vast proportion of the preliminary and subsidiary labor has been already performed. During the two centuries and a half which have elapsed since the completion of King James's translation, the science of linguistics has been, if not strictly speaking absolutely created, at least so modified, organized, and enriched as to have given a new direction, new methods, and new means to the pursuit of ancient literature, sacred as well as profane; the special philology of the Oriental and of the Greek tongues has made immense progress, both in grammatical detail and in philosophical treatment; the geography, the history, the civil and political institutions, the theological and ethical systems of the Hebrews, and the tribes allied to them, have been very completely investigated; numerous ancient and authoritative manuscripts, unknown to the European scholarship of the seventeenth century, have been discovered, subjected to the most searching tests of modern criticism, and carefully collated, and the results made accessible to the world through the press. Hence, Biblical learning, in all its aspects, has been greatly advanced and widely diffused, and the scholars of every Protestant and, in a less degree, of most Catholic nations have, in different ways, contributed to the common stock of means for correcting and elucidating the text of the sacred books of the Jewish and the Christian law. The general result of all these labors has been to reduce the number of really doubtful questions, whether of reading or of interpretation, and so to bring the different texts to a nearer accordance in words and in meaning.

The new aids we have been describing are of greater value in reference to the revision of the translation of the New Testament than of the Old. Hebrew codices of real antiquity are both less numerous and less discrepant than early Greek Scriptural manuscripts; and notwithstanding the immense progress of Oriental learning in Europe, our knowledge of the Hebrew language and of the immediately related dialects is not so much greater than that possessed by the English scholars of 1611 as is our acquaintance with Greek. So far as the readings of the originals are concerned, the best Hebrew text which could now be formed would differ less from that followed by the translators of the standard version than the best Greek recension of the New Testament would from that adopted by the same body. The vast mass of Biblical learning collected within the last two centuries is of greatest importance for the elucidation of the Old Testament in the way of collateral illustration, while in the revision of the New it would give rise to more frequent if not more important changes in the verbal rendering.

When, and only when, diplomatics, criticism, and exegesis shall have done their work, and a text and an interpretation which may be considered as approximately definitive are secured, the translators should begin their task of giving to that text the fittest possible expression in English words. It should evidently be the aim of Protestant translators to produce a version of the Bible—the great manual for self-instruction in spiritual things—which shall be intelligible to all who are able to read understandingly any writings treating of subjects identical with or analogous to those which compose the material of the Bible. This material is of several classes—the narrative, the discursive, the prophetic, and the devotional; each requiring special modes of expression and each possessing, to some extent, a special vocabulary. Another indispensable quality of the version is that it be so thoroughly idiomatic, so completely in harmony with the abiding character of the language, that it will remain intelligible and expressive, and therefore need no new revision for a long period of time. For the accomplishment of these two objects, expressiveness and permanence, the diction of the translation must be selected from that part of our composite word-stock which is most widely understood, and which, at the same time, is least liable to go out of use or to change in signification. There is another important point which it is proper here to notice. The English language is fortunate, above all others, in possessing a sacred dialect, not indeed sufficiently copious to furnish a complete vocabulary for all the purposes of devotion and of spiritual teaching, but sufficiently so to give a pervading tone of dignity and solemnity to any religious composition, in poetry or in prose, in which it is judiciously employed. This dialect is made up partly of words peculiar to it and partly of archaic grammatical forms. One of the most delicate and most difficult points with which the revisors will have to deal is to discriminate between the elements belonging exclusively to this dialect and those common also to the ordinary English speech, and to determine to what extent the former shall be retained in the new recension.

In the first of these articles, we specified, among the legitimate aims of a new revision of the English Bible, "the substitution of more appropriate words or forms of expression for terms and phrases which are now wholly obsolete and unintelligible to the ordinary reader;" and hence it is necessary to enquire what words and forms, or classes of words and forms, employed in the Bible of 1611, have become obsolete and unintelligible to the ordinary reader. Upon this subject there has prevailed, and still prevails, a very wide diversity of opinion among persons who have studied the question. Booker's "Glossary of Obsolete Words and Phrases in the English Bible, Apocrypha, and Book of Common Prayer" (Dublin, 1858), enumerates not far from five hundred words and phrases in the Bible and Prayer-Book which the compiler considers to have become so far obsolete as to require explanation for the ordinary reader, and about fifty others which are obsolete indeed, but still sufficiently intelligible. The writer of these articles, upon a careful examination of Booker's list some years ago, came to the conclusion that in the United States, where, probably in consequence of the general study of the Bible in the earlier days of our history, the popular dialect is more archaic than in most parts of England, not more than two hundred of these words and phrases were so far forgotten as to need any explanation for persons of ordinary culture and understanding.[*]

On the other hand, Wright's admirable "Bible Word-Book, or Glossary of Old English Bible Words" (London, 1866)—one of the most valuable contributions which modern learning has made to the elucidation of the language of the standard version and of the English literature contemporaneous with it—enumerates about eighteen hundred "words, phrases, and constructions" in the Bible (including the Apocrypha) and the Book of Common Prayer which the compiler considers as "either obsolete or archaic," though, in justice to him, it should be stated that he by no means advocates their rejection from the English text for that cause. This is thrice as many such words and forms of expression as are contained in Booker's list, and yet both catalogues omit most of the archaisms of mere inflexion. But there are professed, we cannot say judicious, Biblical scholars who go much beyond even Wright in their estimates, and, in some of the attempts at a revision of the English Bible, much more than half the old vocabulary is rejected as too unfamiliar to be readily understood. As Wright observes in his preface, it is "difficult to fix a standard by which to decide whether a word is partially or entirely obsolete, whether the phrase of which it is part is fallen into disuse, and whether the construction in which it is found is such as no modern writer would employ," and he thus expresses the rule which he adopted as his guide: "I have endeavored, in the case of each word, or phrase, or construction, to ascertain whether it would find a place naturally in the usual prose writing of the day; I say 'naturally,' because I wish to exclude all conscious and intentional employment of archaisms. It is necessary, moreover, to take prose as the standard, because, in all languages, poetry has dominion over the words of many generations." The application of such a rule would be affected, in the case of every enquirer, by the character of his favorite and familiar reading, by the usage of the circle in which he chiefly lived, and by his own personal tastes and habits of speech and composition. Hence, lists of archaisms in the English Scriptures, prepared independently by different scholars, would vary widely in the number and character of the words and phrases they would embrace under that designation. It is difficult, however, to imagine that any really sound critic would find a larger number of unfamiliar words and forms of expression in the standard version than Wright has done, and his catalogue must certainly contain nearly all such as can be regarded as in the least uncurrent or unusual. Indeed, he introduces numerous vocables and verbal combinations which might be, and in fact are, frequently employed in the popular literature of the day without exciting notice as at all uncommon. Thus, he characterizes the use of *a* with the participle, *e.g.*, *to go a fishing*, as "obsolete;" and we think a writer of our time who should use *abate, to acquaint himself, adjure, ado, advisement, affect, afoot, alien, allege, allied, amity, and all, apple of the eye, babbler* and *babbling, backbite* and *backbiter, backside, band, beeves, brag, by-way, by-word,* not to mention hundreds of other words, in senses and combinations regarded as archaic by our author, would not expose himself to criticism as affecting antiquated forms of expression.

But it is one thing to determine whether a given word or construction is to be regarded as archaic, and quite another to decide whether it ought, for that reason, to be rejected from the English Bible and replaced by a newer coinage, or by an expression which, if equally old, has better maintained its ground in our common speech. There is room for great difference of opinion on questions of the first sort, which are properly points of philological history—questions of fact—and for far greater on those of the second order, which address themselves rather to the æsthetical faculty, and require for their solution not only entire familiarity with the whole compass of the English vocabulary, but the most lively sympathy with the English mind and heart, and the most comprehensive as well as refined and cultivated taste. The revisors must bear in mind, too, that the Bible is not merely a law, an authority in matters of moral and spiritual concern, but that the authorized version of 1611 is the "volume paramount" of our literature, and, as such, the most important of all existing instrumentalities of education possessed by the vast multitudes whose fireside speech is the English tongue.

The attainments and the aptitudes required in those who are to give to the interpretation of the text a true English expression appear sufficiently from what has been said of the proper aims and character of the revision, and they need not be here particularly specified. They are totally different from those indispensable to the critics who are to fix the reading and settle the exegesis of the original text, and the latter by no means suppose or imply, if indeed they do not even exclude, the former. The most learned oriental or classical scholars do not as a rule write the best English, and most men who have so far familiarized themselves even with but a single foreign tongue as to think in it, or only to read it habitually without mentally translating it, will find, upon careful examination, that they have acquired this power at the cost of something of their mastery over their native speech. In fact, the more completely we are at home in a foreign language, the more sensibly we feel the difficulty of finding equivalents for its words, its conventional phrases, and its idiomatic turns of expression in our own. From all this, it follows that, for a satisfactory revision of the English Bible, we require, if not two distinct sets of scholars, certainly two classes of qualifications not ordinarily possessed in their full extent by the same individuals, and, consequently, there must be a division of labor—the establishment and interpretation of the text to be translated, and the wording of the new English recension, being assigned to different committees, the first acting, in the main, independently of the second; the second, on the other hand, constantly consulting the first.

[*] "Lectures on the English Language," pp. 263, 630, n.

It remains to enquire what guarantees the plan proposed by the Convocation of the ecclesiastical Province of Canterbury offers for the due execution of these tasks.

G. P. M.

TROCHU ON THE FRENCH ARMY.*

THE battle of Sadowa had been fought, and the vision of a power capable of rivalling or even surpassing the military greatness of France had suddenly loomed up before the eyes of the French, but no native critic had yet dared even mildly to impugn the excellence of the French army itself, when General Trochu startled the leading circles of the "grande nation" by the anonymous publication which we have now before us in its nineteenth edition. He had the moral courage to enunciate truths which could not but be wounding to the vanity of the people as well as to the pride of its rulers. His convictions were the ripe fruits of both study and experience, and he uttered them with the candor and calmness of a man who seeks for truth and confesses it, regardless of popular feeling. His book caused a profound sensation; it was widely read; it received much tacit approval and much public censure. Marshal Niel undoubtedly turned to advantage many of its remarks in his partial reorganization of the army; but it was not until the late reverses so rudely opened the eyes of the French to the rottenness of their military organization that full justice was done the author, who was then, as if by acclamation, called forth from his retired position to save the capital, and with it the compromised honor of the French arms.

General Trochu, in a dedication "to the memory of Marshal Bugeaud," and in an introductory biographical sketch of him, declares himself the pupil of that conqueror of Algeria whose independence of character and originality of thought—as a military man—were equalled only by his intrepidity and patriotism; and throughout the book we meet with the Marshal's terse and quaint observations and adages. Bugeaud had a critical mind, and Trochu but followed his example when making his early reflections—in writing, originally for himself—on the military operations in which he participated. Already in the Crimean war, and still more in the Italian campaign—although both were crowned with success—he noticed with regret "a desultoriness in the operations bordering on disorder . . . an insufficiency of needed means, a superabundance of other means less important, collisions, the frequent use of expedients—in a confusion which evidently proved that there had been no mature *preparation*;" nor "had the soldiers fought with as much order and method as they had shown *élan*." These observations, made public years ago—after some hesitation—must have been just, for the defects pointed out are the very ones which have destroyed the French armies in 1870.

But the French were in no mood to listen to criticisms so long as they achieved victories heralded as glorious. Critics "met with incredulity, with contempt, sometimes with indignation." Nor were they inclined to imitate improvements adopted by other nations. The Prussian army, for instance, was ridiculed in the official text-books as "a school of landwehr, an organization splendid on paper, an instrument of doubtful utility for the defensive, the great imperfection of which the first stage of an offensive war must make manifest." The tone changed when the despised "young soldiers" of Prussia laid Austria low in a few weeks, Sadowa eclipsing Solferino. "La France se réveille comme en sursaut, s'émeut et s'agite." The immediate adoption of the Prussian system was now demanded by many, "contempt changing into idolatry without transition." Others energetically opposed its introduction. A severe conflict of projects ensued, but the guiding principles were wanting. General Trochu, in writing his book, set out with the intention of establishing those principles. In so doing, he had to expose to foreign students of war the defects of the French organization, but he had no reason for avoiding it. "Ils nous savent beaucoup mieux que nous ne nous savons nous-mêmes," he tells us in the Introduction.

A brief chapter, entitled "Definition," shows an army to be a complicated whole, working with the aid of a moral motor and a material mechanism. The higher sentiments of the nation must constitute the motor; a multiplicity of harmonious components, the mechanism. Excellence in both respects makes a superior army. A succeeding chapter, on the "Character and Military Aptitudes of the French Nation and its Army," shows us that in the latter "the motor is of a peculiar character, and of great energy." The French are endowed with a very lively spirit of nationality; their warlike traditions are as old as France; and they have a special aptitude for cherishing everything grand in their history, as well as for explaining and justifying their reverses—very frequent reverses, indeed—commemorating them by single chivalrous deeds and sayings, true or not, which poetically ennoble the struggles in spite of defeat. The history of Waterloo, for the mass of the French people, is written in the words: "La garde meurt et ne se rend pas;" that of the battle of Pavia in these: "Tout est perdu fors l'honneur." This exclusive remembrance of glorious things, and the sentiments it engenders, render the French a *warlike* people—warlike, but not *military*, for the French lack "that tranquil temperament, that constant habit of exactitude and punctuality, that rigidity of manners and attitude, which so admirably lead the peoples of the North to obedience, to resignation under rules, to discipline." The French soldier obeys, but not without murmur; he is not easily disciplined; he requires compression and repression. He is naturally brave and capable of the greatest sacrifices, but he is far from being the best soldier in the world. And he must be treated according to what he is.

These remarks are followed by some fine observations on the "Simplicity and Fixity of Rules," requirements constantly sinned against by the French military authorities. There is an incessant changing, improving, innovating, and renovating, productive of endless complications. The improvements are all brilliant in the garrisons and peaceful camps, but they mostly prove wretched failures in war. The innovators are often theorists who never made a campaign. Every new theory has a peculiar charm for the French. Overthrown by facts, it is replaced by a fresh theory. And this feverish doing, undoing, and doing anew destroys all sequence and logic in army matters. The laws, ordinances, decrees, and decisions have been multiplied to a degree which makes the knowledge of them a monstrous task. The official military journal which embodies them all presents an endless labyrinth full of obscurity. And in this obscurity only the Minister of War is entitled to lead—owing to the all-embracing centralization—and he is so overwhelmed with his duties that, in the language of Bugeaud, "celui-là qui doit mener la voiture, la tire."

The disquisition on "Recruiting and Reserve," one of the most important, reviews the various laws concerning those subjects, and severely condemns substitutes, bounties, and all those features of the French institutions of 1867 which impressed civilians with the idea that taxes were equivalent to services in the army, nourished in the soldiers themselves habits of speculation, thus doubly weakening the military spirit of the nation, and introduced senility and heaviness into the cadres, in which two main forces, education and impulse, ought to prevail. It equally condemns the formation of *reserves of men*, instead of *reserves of soldiers*, as organized under the Prussian system, various features of which are favorably contrasted with corresponding ones in the French. Next comes a not less attractively than ably executed comparison of "Young Soldiers and Old Soldiers," which also expresses a decided preference for the views embodied in the Prussian military legislation. A young soldier is a good fighter, for he is "full of the illusions of his age, full of faith in the future, and faces death . . . almost without believing in it;" after service, he will be a steady, experienced, courageous, and law-abiding citizen. An old soldier "knows better the value of life, and is loth to spend what remains to him of that capital;" besides, he has almost entirely lost "the passions inherent in the condition of a citizen." He gradually becomes a *grognard*, in the worse sense of the word. A separate chapter is devoted to the exposition of the popular fallacies concerning "The Grognards of the First Empire," who, in fact, were far from forming the strength of the Napoleonic armies.

The chapter entitled "The Spirit of the Age in the Army" is sufficiently characterized by the motto, from Count Morand, prefixed to it: "France needs an army capable of guarding her glory, defending her independence, and preserving her from the degeneracy and languor into which the love of riches and enjoyments has drawn so many nations." It is hardly necessary to add that our author does not find this beau ideal in the French army of 1867. On the contrary, he is startled by the view which its ranks offer to him, of an exaggerated and distorted ambition, "which covets everything, which has its origin in pretensions, and competition for its means, and which nothing appeases." As an antidote to this dangerous element, which produces *conservative soldiers*—that is, soldiers conservative of their lives in war—and speculating generals, he proposes special military education, such as would be apt to inspire a genuine ambition and civic virtue. In the brief chapter on "The Spirit of Hierarchy," he deplores the gradual vanishing of this "traditional, very elevated, and eminently conservative sentiment, which formerly was one of the cohesive forces in the army." He considers this a grave symptom, accompanying, as it does, "the general decrease in French society of the principle and habits of reverence." The "Reflections on Advancement" contain various propositions tending to obviate the evil of "too many incapable men reaching the summit in the army," to quote again Marshal Bugeaud.

---

* "L'Armée Française en 1867." Nineteenth edition. Paris: 1868. New York: F. W. Christern.

The "General Education of the French Army" is one of the most widely interesting themes of the book. That education, General Trochu shows, is calculated by its teachings to make the French soldier rely too much on his vaunted natural gifts—bravery and *élan*—and ignore his inferiority to warriors of certain other nations in self-possession and solidity. "His is the bravery of imagination; theirs, the bravery of temperament;" and the author has had many an opportunity to learn how unpleasantly the French troops can be surprised by the unexpected courage of their antagonists. They advance to the attack with incomparable vigor; but, when vigorously met, they fall back in disorder. And this disorder is mainly the effect of their disbelief in the enemy's valor. The French officers and men lack instruction as to "the moral condition of the troops in the field; how this moral condition is acquired; how it is preserved and developed; how it is lost."

The chapters we have spoken of form about half of the work; the other half treats of themes less interesting to the general reader, and the illustration of which would require more detail than we can find room for within the limits of our review. These are treated in chapters successively entitled: "The Distribution of Troops in Garrisons," "The Administration of the Army," "The Preparation for War," "Infantry," "Cavalry," "Tactics of the French Army," "Manœuvres," "The Armies in the Field," "Panics in Face of the Enemy," and "The Combat." A double "Conclusion" sums up the principal results attained, and gives the outlines of a law of recruitment proposed by the author. Its main features are: Yearly contingent, 100,000 men; service in the active army, five years; service in the reserve, three years. General Trochu acknowledges that his plan is inferior to the Prussian, which is calculated to create an army both perfectly efficient and completely national; but he knows that the introduction of the Prussian system requires time, a period of assured peace, and the education of the people up to it, and knows also that both the prospects of peace and the disposition of the government to undertake that education are very slight. He also believes, with Montesquieu, that "ancient institutions must be touched only with a trembling hand." Cautiousness and prudence characterize, in fact, all his utterances; and, if the style be the man, the man must be excellent.

FRANCE IN AFRICA.*

WHOEVER reads the late M. Prévost-Paradol's eloquent pages relating to Algeria in "La France Nouvelle" may have some idea of the vast and increasing importance of this colony to the France of the future. When France turns her back on Europe she faces Africa; and she is the only people so situated, politically and physically, as to be able to found "that Mediterranean empire which shall be not only a satisfaction to French pride, but which, in the future condition of the world, is the last refuge of her grandeur," for the only nations who might compete with her are in a condition fit for being conquered rather than for conquering. The French are excellent hands to render barbarous nations subject to military authority; but they know nothing of colonization in the Anglo-Saxon sense of the word. They once had firm hold in North America, India, and New Zealand; but their military occupation gave way to Anglo-Saxon backbone and force, which developed the resources of those countries, and has made us *the* race of the world. The administration of Algeria under the late Empire was worse than that of Canada under the Bourbons. The viceregal government is purely military, and M. de Montebello, who, as an ex-captain of Turcos, professes a high regard for the French army, shows that the fact of the military being the "head instead of the arm of the administration" is a "bar to progress and an insurmountable obstacle to the civilization of the natives." Immigration has ceased, and although emigration can hardly be said to have fairly commenced, yet, during a single month of the year 1868, no less than one hundred agriculturists left the province of Oran to settle in Brazil.

Unless the present Algerian policy is radically changed, the colony can never be other than a drain upon French resources. There are indications, however, that this will be done; and if so, it is possible that M. Prévost-Paradol's dream of from eighty to a hundred millions of Frenchmen living on both shores of the Mediterranean will be realized.

The book before us, bearing the modest title of "Quelques Mots sur l'Algérie," has been very favorably noticed by the leading French reviews, and has great interest as furnishing an explanation of the wants of Algeria from a colonist's standpoint. The somewhat prevailing notion that a country extending over 150,000,000 of acres, with a native population of 2,700,000 and a European population of 240,000, only 130,000 of whom are French, can never be assimilated to France, M. de Montebello is confident is an error. Except near the large cities, and in the wine producing sections, the price of land in France is remarkably low; and the young peasant prefers to till his native soil rather than that of Africa. The population of France, moreover, does not increase at all; and that North Africa should ever become peopled with a race having French blood flowing in their veins is wholly out of the question. But if we contrast Ireland and Poland with Alsace and Lorraine, we have a right to consider France—so poor a mother to her own offspring—an admirable stepmother. The large native population was deemed an insurmountable objection to assimilation; but M. de Montebello shows that the Africans are not such very bad people after all. The two great races in North Africa are the Kabyles or Berbers and the Arabs. The former, known in different localities under the names Chaouia, Braba, Zouaves, etc., have lived in the country from time immemorial. They are the descendants of Massanissa and Jugurtha; signs of the Phœnicians, Carthaginians, and Romans are still to be found among them; their laws have been traced to the jurisprudence of Justinian; and, more than all, they were once zealous Christians. In the early part of the sixth century they were in quite an advanced stage of civilization, but the successive tides of Arabian conquest forced them to adopt the manners and customs of their invaders. The Kabyles are excellent husbandmen, and are very teachable. They are frugal, industrious, live in houses, and have but one wife, whom they treat as an equal. It is very fortunate for France that this race, having a strain of European blood in its veins, vastly predominates; for the Arabs, on the other hand, are as wild, untamable, and incapable of civilization as our Pawnees and Sioux; and, like them, they happily are melting away. During the great famine of 1867, no less than two hundred thousand of them starved to death; and the rest were reduced to a wretchedness of which civilized nations can have no idea. Today there are probably not over four hundred thousand pure Arabs in the entire colony. But still they are a great impediment to progress. A single Arab needs as much territory to live upon as would support five hundred Kabyles; and the policy of the Government has tended to "Arabize the Kabyle rather than to Kabylize the Arab." Nevertheless, M. de Montebello, together with all the other colonists, is sanguine that if the three provinces in North Africa were in all respects treated as any three provinces in France, not only the numerous emigrants from other European states, but also the natives themselves, would in due time become as French as the inhabitants of Lorraine.

M. de Montebello proposes assimilation as the cure for all the ills of Algeria; and after reading his book, which offers so interesting a study to all who wish to have a thorough understanding of European affairs, we can see no reason why this colony should not at least resume its ancient place as the granary of the Old World.

NATIONAL SELF-GOVERNMENT.*

THERE are just now many late publications in Europe and the United States upon government and political science claiming the attention of the public, and, unfortunately, none of them very thorough or systematic. It is a question which we do not here propose to enter upon, why political literature is decreasing in ability, while the practice of government is increasing in its success and in its benefits. But certain it is, that modern "Cæsarism" has for its defence no Machiavellis and Hobbeses; moderate, reasonable self-government is not defended by any more Lockes, Miltons, and Sidneys; and the free despotism, or despotic freedom, of democracy, has no more Rousseaus.

The readable and even interesting little volume before us does not fulfil the expectations which the reader may have very justly formed from its title. "National Self-Government in Europe and America" is a big title, it covers much and very difficult ground, and one would naturally expect, on opening the book, to find at least an attempt to define political nationality and national self-government; and one would also naturally expect to find some discussion of the history and analysis of the two most notable and prominent features of modern political development—the tendency towards national political consolidation (not centralization), and, under that, the other tendency towards the freedom, individuality, and legal equality of all men. The relations of these to each other, and how they produce, develop, and support each other, present a fruitful and useful theme for discussion. But this we do not find. If the author occasionally, and only accidentally as it were, points us to the outcroppings of the vein, he cannot lay any claim to having worked this mine of thought patiently and systematically.

---

* "Quelques Mots sur l'Algérie. Par le Comte Charles de Montebello." Paris: Challamel aîné. 1870.

* "National Self-Government in Europe and America. By J. W. Probyn." London: Trübner & Co. 1870.

The work is more historical than exegetical, and the scraps of history may be called good—about as good as mere scraps can ever be made. The historical statements relate to France, Belgium, Germany, Italy, Austria, Russia, and the United States, a larger space being given to the United States than to any other country. The style is simple, condensed, unpretending, and straightforward, and extremely few foreigners have shown so much fairness and so much accurate information of our institutions and of our political parties in attempting to discuss our political history. He is a pronounced adherent of the Union and anti-slavery side, but some of our own authors on the same side might take a lesson from his moderation and fairness.

The historical facts in reference to Europe relate mainly to the manner in which the different governments, more especially France and Belgium, passed through the crisis of 1848, and to the unification of Germany and Italy, and the liberalization of Austria. This feature of the book not only makes it well worth reading, but gives it a real value to the general, unlearned, and often hasty reader, who wants a general idea of that section of modern European history, and has not time to hunt it and dig it out of some scores of volumes, where he would at last find it only, as he finds it here, in scraps.

It is perhaps well the author's effort has taken this direction. A writer on government or political science should make history his handmaid and not his object, and there are indications that in an essay of that sort Mr. Probyn would not achieve very great success. Here is the first sentence in the book: "In the present day, every intelligent person, it may fairly be presumed, will admit, at least in theory, that both order and liberty are necessary to the good government of a civilized people." The position here assigned to *order* is a little like saying that good crops are necessary to agriculture, and one always feels, on reading such a sentence, that the author is just a little looser than he has a right to be. Then, as a mere matter of style, we think that no author should put in a book on a grave subject such language as this: "They will give, as occasion offers, a slap in the face to constitutional monarchy, and then administer a smart back-hander to republicanism." Neither do we like "Britishers," "Yankee Republicans," "Jefferson Brick," and "Marquis of Dunderhead," on page 219.

Some of our own war-horses and screechers against caste and aristocracy (witness the discussions about the reform of our civil service) could learn in this little book, and for that matter in several others, especially the works of George Cornewall Lewis and Bagehot, that names do not always indicate form, much less substance, and that a republican monarchy—a republic with a hereditary executive, worked by a *self-governing people*—is not only possible, but actually exists in several countries. For fear somebody will misunderstand us, we beg to say that we are not in favor of crowning General Grant or importing a Hohenzollern, but only indicating how much less some people know about politics than they might, if they would study it more and talk about it less.

The author's failure to apprehend as well as to discuss what *is* real self-government, and especially what are the conditions for its operation and success, seems to us to be manifested in his estimate of the causes of the different results in several countries of Europe in 1848, especially his comparison between France and Belgium, between Louis Philippe and Leopold I., and the reasons assigned why Philippe lost his crown and throne, and Leopold preserved his own. We do not doubt the truth of the reasons given, that Philippe was good but narrow, stubborn, and stupid, while Leopold was good and also enlightened, liberal, and progressive. These are not examples of self-government, but only of the accidents that favor or retard its introduction. The goodness and badness, the wisdom and unwisdom, of kings are accidents, and complete and successful self government is superior to this accident and will control it, though sometimes with difficulty. It may be very true that Charles X. and Louis Philippe lost their crowns by mismanagement, and could have held their crowns by good management, but the *fact* that revolutions were necessary to get rid of them, or the fact that such contests result in revolutions, shows that there was no self government deserving the name going on in the country; and the author's statement that there were only 200,000 voters, in a population of 35,000,000, confirms this view. The true test of self-government is that it can accomplish all its wishes without war or disorder inaugurated by itself, and only resorts to force to resist force, or to remove violent and unconstitutional obstruction. The second election of Lincoln in the midst of a civil war, and the peaceful though angry solution of the quarrel between Congress and Andrew Johnson, and the late disestablishment of the Irish Church, could have occurred peacably only in self-governing countries. We do not accept in all its extent the author's apology for the French people, though we may accept fully his judgment against French emperors and kings.

Upon the whole, the book is instructive without being profound, is an ardent and intelligent plea for real liberty, and is written with almost childlike simplicity.

The Life of Arthur Tappan. By his Brother. (New York: Hurd & Houghton.)—The subject of this memoir might fairly be claimed by this city for itself, since he made it the principal theatre of his mercantile career. But New York, when he came to it, had already begun to be the mere business camping-ground which it is now in so eminent a degree, and, except the opportunity of making and charitably disbursing money, he owed nothing whatever to it. It hated him, and mobbed him, and sought his life, and would have made him as infamous as it did notorious. He was a pebble of New England granite in its shoe, and it is as a New Englander that Arthur Tappan deserves to be studied and remembered. He is probably the best if not the earliest type that can be named of a class almost peculiar to that region, among whom there is the most intimate connection possible between the pocket and the heart. He was more than a generous giver, such as, following him, were Peabody, Vassar, Cornell, Simmons, and a host of others; he was an independent force in the community, an element which suddenly appeared when it had not been counted upon by friend or foe. Those Bostonians were his lineal successors who, when the South thought it had merely the Republican party to contend with, formed the Kansas Emigrant Aid Society, and lent a helping hand to John Brown in Virginia, and afterwards raised colored regiments at their own expense, and, still later, devoted themselves successfully to arousing public sentiment against repudiation. In the same way, when Prudence Crandall, in Connecticut, seemed likely to be crushed by an iniquitous law against teaching colored pupils, he directed her friends to employ the best counsel at his expense, and to start a paper, whose deficits he would make good; when Mr. Garrison seemed indefinitely immured in Baltimore jail, Mr. Tappan voluntarily paid the fine and set him at liberty; when the pro-slavery party seemed to have triumphed in repressing free discussion at Lane Seminary, he offered himself as the banker of the students who withdrew from that institution to go to Oberlin. At critical moments in the existence of a dozen religious, philanthropic, or educational enterprises, he emerged from his busy privacy to give them encouragement or to assure their success, with a liberality which has certainly never been equalled in this country, and with a modesty that could not be excelled.

With every day that passes, the history of the times in which Arthur Tappan lived becomes more and more strange and incredible for the generations that have since come upon the stage. In this respect, the volume before us has more than a biographical value. It is a sketch, in the main accurate and uncolored, though lacking form and method, of such events of the last half-century as had concern for one who above all "loved his fellow-men." Among these the anti-slavery agitation fills naturally the largest space, and again that part of it which had New York for a centre. In 1833, the house of the editor, Mr. Lewis Tappan, was sacked by a pro-Southern mob, and his brother's store only escaped the same fate by a vigorous defence from within. In those days a determined abolitionist would keep a hot-water tank in his garret with which to resist assault. During the draft riots of 1863, abolitionists were still attacked in their homes. Apparently there had been no progress in thirty years. Undoubtedly, however, the last abolitionist has suffered for his principles—as such, he can no longer have any fear of living in New York. Thanks to our present mode of government, it is rather the rich, whose wills may come to probate, who are afraid of dying here.

BY THE AUTHOR OF THE "WIDE, WIDE WORLD."

WHAT SHE COULD.

A Story. By the author of "The Wide, Wide World," "Queechy," "Old Helmet," "Melbourne House," etc. 16mo, three Illustrations, $1 25.

"Every new work of fiction by this gifted author we receive with a cordial welcome, for we know it will be an addition to that pure, elevating, and delightful class of books which we may love as the fireside literature of our country. She writes for the domestic circle. Her works have that charm about them that makes the old feel young, and the young feel old, as they read them, so sweetly do they blend the wisdom of age with the sprightliness of youth."—*N. Y. ILLUSTRATED TRAVELS

ALL ROUND THE WORLD:

A RECORD OF DISCOVERY, GEOGRAPHY, AND ADVENTURE.

EDITED BY H. W. BATES,

Assistant Sec. of the English Royal Geographical Society.

Prospectus.

The "ILLUSTRATED TRAVELS" is copiously illustrated with beautiful and authentic engravings, and gives accurate information of foreign countries, in the form of narratives, by travellers of the highest repute who have recently visited them.

In the choice of subjects for each monthly part, preference is given to those countries which happen to be of the most general interest at the time. Thus the different parts of the world are treated of in succession, and in course of time a body of useful information and entertaining reading on the most interesting subjects will be brought together, relating to the position, physical features, and natural productions of countries, and to the characteristics of their inhabitants, their institutions, customs, opinions, and everyday life.

The Political and Religious Aspect of Nations, Historical Geography, and Visits to the Sites of Important Events in Classical and Biblical History, Physical Descriptions of Interesting Regions, Narratives of Naturalists, Hunting Adventures in Wild Regions, Alpine Climbing—all these will be included in the range of subjects, as well as Narratives of Sea Voyages, Journeys of Discovery, and Descriptions of the Modern Condition of Countries.

CASSELL, PETTER & GALPIN,

SLAVE SONGS OF THE UNITED STATES.

A Unique Collection of Original Melodies—words and music—obtained among the negroes of the South; preceded by an account of these Songs, and an Essay on the Negro Dialect, as observed at Port Royal, by Prof. W. F. Allen, of the University of Wisconsin. Cloth, 8vo, price $1 50.

Sent post-paid on receipt of price. Address PUBLISHER OF THE "NATION," Box 6732, New York City.

The Nation.

NEW YORK, THURSDAY, OCTOBER 27, 1870.

The Week.

THE week has been full of peace rumors. Whether there is anything in them, and if so, how much, it is almost useless to speculate. The general tenor of advices from Europe goes to show that the neutral powers would, of course, be glad of peace, and that the belligerents would be more glad of it than they would have been a month ago; and that somehow—we don't well know for what reason—England has been generally fixed on as the power whose duty it is in an especial manner to bring it about. The London Positivists, in combination with the redder democrats, have been trying to stimulate the Ministry into action by rather violent demonstrations in the streets, which, however, look far more formidable than they are. The "International Association" of workingmen has undoubtedly something to do with the movement, as the Continental members are boiling over with eagerness to get the soldiers out of the way and get the French Republic into their hands—France being, amusingly enough considering the feelings of the great mass of the population, the country above all others in which the more ambitious social reformers expect to realize their dreams about capital and property. Whatever the influence under which he is acting, there seems to be no doubt that Earl Granville is trying to intervene; and there is at this writing talk of an armistice to permit the election of the Constituent Assembly. The fall of Toul, and Soissons, and Strasbourg have rendered this less difficult for Bismarck to concede than it was a fortnight ago.

Most of these announcements, simultaneously coming from London and Tours, agree with each other. Earl Granville, through Lord Lyons, has taken the initiative. The co-operation of the Courts of St. Petersburg, Vienna, and Florence is either promised or expected. Communications have been made both at Tours and Versailles, and have been favorably received. The overtures refer chiefly to the conclusion of an armistice, during which the elections for a Constituent Assembly should take place, which, after its convocation, should immediately deliberate on a basis of peace. It is asserted that King William is favorable to the scheme, but that Bismarck insists that an armistice must involve "a practical basis;" that is, the concession, by the Government of National Defence, of "the principle of cession of territory." Whether this "principle" was distinctly mentioned by Lord Lyons to the Government at Tours, we do not know; but, however it was, Gambetta answered that he and his associates on the Loire could do nothing without the concurrence of their colleagues in Paris, whither he would send M. Thiers, if a safe-conduct could be obtained. This, we hear further, Bismarck is expected to send, assenting on a proposal by Earl Granville to open the negotiations by a personal meeting with the old French statesman.

Besides these negotiations, we hear of others going on between King William and Marshal Bazaine, and it is stated that an agreement has been matured, according to which the Empress Eugénie is to proceed to Versailles, there to sign a treaty of peace, as the legitimate representative of the Imperial Government, the only one recognized by the King. Eugénie, of course, is to become regent, and Bazaine the main staff of the restored Empire, and Prussia to be satisfied by large cessions. These negotiations are said to be carried on chiefly through General Boyer, and to be favored by the Court of Russia. Strange as these reports sound, they seem to have caused some uneasiness at Tours. It is not at all impossible that rumors of this kind are intentionally spread by Bismarck, in order to make the republican rulers of France more readily inclined to listen to proposals of peace addressed to them. That till now they have uniformly spurned every intimation to purchase peace at the price of territory, is evidently owing to popular pressure rather than to their own blindness or political fanaticism. The influence of the Tours press in this respect appears as pernicious as that of any press has ever been to the true interests of a people distracted by disasters.

Scarcely had the news of attempted diplomatic intervention by England become known at Tours, when the journals and public began to abuse that power in concert. Some saw in the whole affair but a Bonapartist plot; most agreed that it was done chiefly in the interest of Prussia. England, they wisely demonstrated, must have become aware that her friend, Prussia, had undertaken a task beyond her power; that Paris could not be reduced; that the vast French armies now raised in the provinces were ready to take the offensive; that, on his part, General Trochu was preparing a series of formidable sorties; that the Prussians were threatened by hunger no less than by the sword, while France was prepared for all sacrifices to save the national honor. And the first-fruits of this concert of voices were a semi-official note, affirming "that the Government in no case will accept a peace humiliating to France," and "will remain firm in its rejection of all propositions for the dismemberment of France"—which, whether seriously meant or not, augurs very ill for the peace negotiations. And, in fact, we hear that the initiator of them, Earl Granville, has little confidence in their success.

There is one feature in nearly all the comments of neutral peacemakers on the war which fills one who looks back a little way with surprise, and that is their horror over its "wickedness," and over the perversity and blindness of the combatants in going on fighting, instead of dropping it just where they stand, and going home. Ever since the appearance of a public conscience about war—that is, about fifty years ago—the nations engaged in war have treated their particular struggle as peculiarly "holy," and the men who fall in it as martyrs, while nearly all the bystanders have held up their hands over the guilt of it. There could hardly have been a better illustration of this than was afforded by our civil war. The great mass of Europeans looked on it as the most outrageously causeless and futile struggle a civilized people ever engaged in, and many an intelligent Englishman and Frenchman—anti-slavery men, too—ascribed the persistence of the North to simple thirst for blood. The European public, too, generally considered the arrangement of the terms of peace, the simplest thing in the world—though there was hardly any American, except Horace Greeley, who did not shrink from it, as a task almost too serious for human powers, and who did not prefer leaving it to the sword. It is now very interesting to watch the subjection of the Franco-Prussian war to the same half-blind analysis. There is hardly a creature, male or female, no matter how silly or ignorant, here or in England, who does not think himself fully competent to show the Germans the folly and guilt of getting themselves killed, and the perfect safety with which they may take Jules Favre's word that France will never want to go to war again for anything this world can offer her.

Little of importance has taken place during the week in and around Paris, so far as our information goes. French reports, brought by balloon and unofficial, speak of Prussian repulses on previous days, and extol the activity of General Trochu—who is said to be preparing for a formidable sortie—the warlike spirit of the Parisians, and the excellence of the gunners who man the forts. These reports, however, go no further than the 21st, since which time no campaign news has been brought by aerial messengers. A Prussian despatch from Versailles reports the discomfiture of a sortie made by the French on the 22d from Fort du Mont Valérien. Though supported by forty field-guns, the assailants were successfully resisted by detachments of two divisions of infantry of the line and a regiment of landwehr, until the arrival of the Fourth Corps decided the engagement in favor of the besiegers—the French retiring with a loss of one hundred prisoners and two guns. There are indications that the Prussians are actively engaged in making preparations for a general bombardment. On their part, the French gunners are busy shelling the enemy's outposts and sweeping the approaches to the ramparts. The gap, on the northwest of the city, between Mont Valérien and St. Denis, is said to have been strongly fortified with earthworks.

The military movements around Orléans and Blois, on both sides of the Loire, are—to use an expression often repeated in reports from Tours—shrouded in mystery. The Prussians hold Orléans in great force, and have occupied all the places around, extending in a semicircle from Châteaudun, on their extreme right, to Châteauneuf, on their extreme left, their reserves in the meanwhile entering Chartres; but whether they have made any movement in advance from La Ferté-St.-Aubin in the direction of either Tours or Bourges, we are unable to discover. The latter place, on account of its military stores and arsenals, may be an even more tempting objective point than the provisional seat of the French Government. Besides, an advance on Bourges would also be a movement in the direction of Lyons, in co-operation with the forces advancing from Épinal and Vesoul. Between Vesoul and Besançon, a heavy engagement took place, on the 22d, near Voray, on the confines of the Departments of Haute-Saône and Doubs, lasting —according to a French report—"from nine in the morning until night," and ending with "result unknown." A detachment belonging to the same forces is reported by General Cambriels, the Commander of the Division of the East—headquarters at Besançon—to have been twice repulsed before Châtillon, on the Saône, in the southwest corner of Vosges. General Cambriels is to be aided by Garibaldi, among whose lieutenants, commanding Mobiles Gardes, Francs-tireurs, and volunteers of all nations, we find his son Menotti, the Spaniard Orense, and the Polish General Bosak, a very able partisan chief. The Prussians, however, seem to be little afraid of these feeble preparations for resistance, and push on rapidly in that quarter—other troops in the meanwhile investing or observing the fortified places in their rear; and not only Besançon is threatened, but Lyons, too, hastily prepares for defence.

There is no fresh war news from Metz, and nothing beyond vague reports and rumors concerning the sieges of New Brisach, Bitsch, and Verdun. One of these reports announces a victorious sortie by the garrison of the last-named fortress. Schlettstadt has surrendered. The active siege of Mézières is not yet begun. Thionville and Longwy seem to be left unmolested. La Fère, in Aisne—for which our dailies have La Ferté-St.-Aubin, to the confusion of their readers —was invested, and St. Quentin, north of it, occupied by the troops under the Grand Duke of Mecklenburg; subsequently, however, the Prussian advance in this direction is said, in French reports, to have been abandoned by the Prussians, their forces retiring towards Laon. An advance, in larger force, on Amiens, is reported going on in two columns from Montdidier and Breteuil. There has been some desultory fighting at various places in Normandy, and in the vicinity of Fontainebleau, where the Prussians have occupied Montereau. The gallantry and pluck of the Francs-tireurs is often extolled in the Tours reports, but of the troops of the line there is nowhere any mention. The whereabouts of the "two armies"—"excellent troops, well armed and equipped"—which, according to the organs of the Tours Government, are to make a sudden appearance one of these days, is wisely kept a profound secret.

The American Peace Society and the American Positivists have both determined to ask Bismarck to make peace without further delay. If their asking him is likely to have any effect, it is a pity and a shame they did not ask him sooner. What is more important than all is, however, that the Woman's Suffrage Association of this city, in convention assembled, have "constituted and accredited Mrs. Emilie J. Merriman their peace advocate and commissioner, to proceed, with all despatch, to France, to present the gravest considerations of peace to William, King of Prussia, and to Jules Favre, Minister of Foreign Affairs for France." Of course it would be ridiculous to notice such bits of ineffable folly as this if the people who perpetrated them were not adults, and were not engaged day and night in trying to persuade the world that it would be far better governed than it is if they had a share in the work. One of the most curious phenomena of the day, too, is the savage vehemence with which the charge of hard-heartedness, and want of sympathy with progress, is made against anybody who requests reforming geese to behave like reasonable beings, and not meddle with things they do not understand. Bismarck and Jules Favre will, doubtless, be polite to "Mrs. Emilie J. Merriman;" but is it not too bad, to put the matter on very low ground, that men with such awful demands on their time, and such a strain on their nerves, should have to sit down and listen to the impertinent gabble of such people?

In commercial circles, the effect of the war continues to be insignificant, or at least not readily visible. The destruction of crops and the waste of food by both armies have at last led to some advance in the prices of breadstuffs here, in anticipation of an increased Continental demand; but the advance has not materially added to our exports, owing to the deficiency of vessels to carry them, and the consequent rise in the freights to Europe. Nor has the advance benefited domestic producers, owing to the corresponding rise in railroad freights from the interior, which has prevented grain and flour from coming forward rapidly enough to exhaust even the old crop, much less to market the new; so that at the great grain centres, Chicago and Milwaukee, prices have actually again declined, very much to the disgust of the farmers, and clearly to the emphatic confirmation of all we have ever said of the supreme importance of the entire question of communication. The hopes of an early peace, and the steady tendency of Lancashire manufacturers to return to American cottons in place of East Indias, have stayed the decline in this our most important export staple, and led to a moderate increase in the shipments, but it is yet too early to form opinions of any value as to the amount that Europe will be able to take of our large prospective crop, or the price it will be able to pay for it. At the present moment, the price per pound is nearly one-third less than last season, so that we should have to harvest one-third more, and sell one-third more, to yield to our Southern States the same net result. It is evident that the latter are more directly interested in the war than any other part of the country. Tobacco and meats, nearly next in importance in the list of our export articles, are materially benefited by the struggle, and remain firm in prices. If our farmers and cotton-planters are injured or not benefited by the war, we have the consolation that everybody will be fed and clothed more cheaply during the coming winter than they have been for years. This is all the more important, as the complaints of unsatisfactory business, even in branches not affected by the war, become daily more general. Cotton-spinners, sugar refiners, woollen mills, the farmers throughout the country, even the coal-miners, complain that they are working without a profit. The dry-goods merchants report a prosperous fall season, and wool-growers have profited by a revival in this long-depressed, tariff-ridden interest. But all accounts agree in representing the trade of the West and Southwest as light, and that of the South as largely done on credit. Real estate, especially unimproved, is decidedly lower; and even the best kind of city dwelling-houses, in spite of an unusually active demand from families driven out of Europe, do not bring a fair rental on recent cost or estimated market value.

The voting in certain Congressional districts at the late elections was so close that victory was fairly claimed by both parties until official returns had been made. This fact, added to false reports in some other cases, makes it necessary to revise our summary of last week in regard to Iowa and Pennsylvania. The first-named State has gone solidly Republican as usual. In Pennsylvania, where majorities range as low as twenty-two, thirteen, and even eleven votes, the Democrats have gained six districts and lost one, making their total gain of Congressmen in the four States six. The significance of this increase for party purposes in the Forty-second Congress is, as we have already remarked, not great; but in both ranks the new members elect will furnish a powerful addition to the free-trade or revenue reform element. The delegation from Iowa is unanimous in this respect, Mr. Palmer, who voted with the protectionists at the last session, having pledged himself on the stump to favor lower duties on iron, salt, and lumber. Mr. Williams, of Indiana, seems likely to be more decidedly anti-tariff than heretofore, if he remember the declarations forced from him by the necessities of the canvass; while his colleague, Mr. Julian, who was an absentee as well as a protectionist, is succeeded by an avowed Republican free-trader, Judge Wilson. In Ohio, Mr. Monroe, the successful Republican candidate in the Fourteenth District, was nominated in convention at the expense of a protectionist, and the defeat of Messrs. Schenck and McClurg is of course in the interest of revenue reform, though there is an offset in the gain of two Republican protectionists. The five Democrats gained from Pennsylvania are naturally to be counted on the side of free-trade. And finally, in balancing these results, the fact that so many leaders of the protectionists have been retired must be allowed its due weight beside the numerical preponderance.

The only State election which has since occurred is that of South Carolina, about which, however, we have at this writing no positive information beyond the general success of the Republican ticket, with Governor Scott at its head. It is doubtful whether the Reform party has carried one or two of the four Congressmen. The Charleston *Courier*, speaking for it, professes to think it would have had a majority everywhere, as in that city, if the United States law had been applicable in regard to the counting of votes and supervision of the ballot-boxes. In the country, it says, there was abundance of fraud, or of opportunities for fraud, and much violence directed against the Reformers. On the other hand, complaints have been made at Washington of "Reform" outrages on Republican voters since the election. General Grant's interference in favor of his partisans had, doubtless, the effect anticipated. That it will be as useful to the regular Republicans in Missouri we cannot bring ourselves to think, considering the superior intelligence of the average voter there. For the rest, the situation seems unchanged, and Mr. Brown's defiance of the Administration probably continues in force. In this State, the chief interest of the canvass lies in the charges brought against General Woodford in regard to his past connection with Oakesmith, the notorious slaver, and in the preparations for and against the Act of Congress to amend the naturalization laws, and to punish crimes against the same, just referred to. The Government is determined to enforce it, and the Attorney-General has come on expressly to confer about it with the Marshal of this District. The triangular or quadrangular contest in Massachusetts has been opened by a savage speech from Mr. Phillips, to which a correspondent alludes in another place. There seems to have been more than one candidate ready to avail himself of the vote of several parties, and Mr. Chattaway, who was nominated for Lieutenant-Governor by the Labor party, has been repudiated for showing that he valued more highly the subsequent nomination of the Democrats. In Rhode Island, the Republican convention in Mr. Jenckes's district was unable to renominate him or to agree upon a candidate in his place, and the party must make its choice at the polls among the three, including Mr. Jenckes, whose names came before the convention.

"Tom Hughes, of Rugby," as we have heard him called, has gone home, after having made the most effective, and we might, we think, almost say pleasantest, trip ever made by any Englishman in the United States. We doubt if any private man ever met with such a welcome from a foreign country, or ever was so successful in putting a new face on an old story. His lecture in Boston contained nothing but facts which, to the best of our belief, have been laid before the American public about two hundred times without producing much impression; but such is the weight of Mr. Hughes's character that his utterance of them made scores of people confess that their opinions on several points in the *Alabama* case were changed. His lecture in New York was equally successful, and for somewhat similar reasons. When a man of as much truth and sincerity as he, and who has for so many years made the workingman's cause his own, tells workingmen that the remedy for their troubles lies in co-operation—that is, in self-restraint, economy, and industry, and not in "politics" and blatherskite and strikes—he reaches thousands of ears which have been deaf to everything which, on this subject, has come from honest men of education hitherto. We are glad to say, too, that Mr. Hughes's audience contained a large body of workingmen, and many of the leaders of the labor movement.

We are able to say positively that there is not a particle of foundation for the stories which have been set afloat that Secretary Cox's resignation was due to "personal reasons," such as his inability to live on his salary. He knew perfectly what the salary was before he took the place, and has never complained or thought of complaining of it as insufficient. There has been only one cause for his retirement, and that is the failure of the President to sustain him against the politicians in the matter of civil service reform. This would appear fully if the correspondence between him and the President were published. Mr. Cox's lips are sealed for the moment by a very proper sense of official decorum; but his reticence furnishes a strong reason why the President should either publish the correspondence or check the exertions which some of his pretended friends are making to spread false versions of the cause of the rupture. We may add that they are anything but friends of the President who are circulating the report that he and Mr. Cox have had differences about the McGarrahan claim.

Senator Morton, it is positively announced, has declined the mission to England, and may very naturally have come to this conclusion apart from the consequences of the Democratic victory in Indiana. He is supposed, like most American politicians or "statesmen," to have ulterior designs in regard to the Presidency, and though a minister to the Court of St. James has been known to become afterwards President, absence from the country is regarded as almost equivalent to retiring from competition. We do not allege that this was Mr. Morton's chief motive in declining, and can readily believe that reflections on the minister's salary and the cost of living properly in England were enough to decide him against going abroad. It would not surprise us greatly if this latter consideration should deter any one whom Grant is likely to nominate from undertaking to supplant Mr. Motley; in which case an argument would have been found in favor of the meanness of our diplomatic stipends, if not of discontinuing our foreign legations altogether.

It is a comfort to know that all our misgovernment has not prevented New York from becoming the focus of art, literature, and refinement. That, at least, we may believe on Mr. Greeley's assurance, as expressed in a letter to the Convention now assembled at Cincinnati to discuss the removal of the national capital. This preposterous movement has failed to obtain the appearance which it sought, of representing all parts of the country—Governor Hoffman, for one, having declined to appoint a delegate to the Convention, and other governors apparently not having taken even the trouble to decline. Mr. Greeley's recommending New York as the proper seat of government must have been rather a damper to the leaders of the enterprise, as they had not probably counted upon opposition from the East except as against a Westernwards removal of the capital. To move it one inch, however, towards any point of the compass, would be as great folly as to move it a thousand miles. To say nothing of the cost of the undertaking, or of the sectional jealousies to be overcome the moment moving was decided upon, there are two facts which outweigh any argument in favor of it: one is, that the eccentricity of Washington is diminished every year by improved means of transportation, and offers already no serious impediment to any Congressman's returning home on an emergency; the other is, that Western men are, and for a long time will be, glad of an excuse to come to the East, which collectively is for them the "focus of art, literature, and refinement." Meantime, careful observers are convinced that Washington is rapidly attracting to itself as regular visitors, or as permanent residents, persons whose society is eminently worth cultivating, and who will draw after them artists and scholars inferior to none in the country. The climate of Washington has been greatly misrepresented, and the surroundings are hardly to be surpassed in natural beauty.

THE FRENCH REPUBLIC.

With people who preserve into mature life the childish faculty of being pleased with names while remaining indifferent to the qualities of things, there is little use in discussing the chances of success enjoyed by the persons in France who are now engaged in an attempt to set up a republic. For what we talk of as the "French Republic" is in reality nothing more than a number of men trying to establish one. Whether they will succeed or fail depends not on what they call themselves, or call the state of things which they are trying to bring about, but on the mental, moral, and material condition of the people of France. If a certain number of city missionaries should in troublous times in New York succeed in getting possession of the City Hall, and inducing a portion of the police force to obey them, and should then announce that the kingdom of God was at last established in this city, there would be a great laugh all over the country, and people would ask the reverend gentlemen many unpleasant questions, first about the extent to which their authority was obeyed, and next about the morals and manners of the denizens of Cherry Street and Mercer Street, and divers other slums and purlieus; and the laugh would be all the louder if the missionaries insisted on treating those who doubted their statements as limbs of Satan.

What we are about to say, we say to that rational portion of the community which knows and remembers that politics are made up of facts and deductions from facts, and that we can no more make a republic by giving that name to a form of government than live within our income by making the figures in our account-books balance at the end of the year. We can hardly hope to produce any impression on that large class who look on republics as the divinely-appointed form of government—that is, claim the "divine right" for majorities, and treat progress as simply a long series of attempts to set up republics, foiled by kings and nobles. Progress means the growth of mankind in wisdom, in humanity, and in self-restraint, under whatever form of government, and kings were as natural and legitimate a product of society in certain stages as courts of law or police. They were contrivances to which it resorted for the preservation of order, and which were the only ones suited to its ideas and culture. To treat them as enemies of mankind is about as sensible as to treat pack-horses as the great enemies of rapid transportation. A republic is a governmental contrivance suited to people who have reached a certain stage of development through a certain process of training: to say that a people has not reached this stage is no more a sign of hostility to republican government than doubting a man's fitness to take charge of an observatory is a sign of hostility to the study of astronomy, and of want of sympathy with his desire to better his condition. The French have, unfortunately, not passed through any process of training for a republic, except such as they got in the brief reign of Louis Philippe. They broke with their kings before they had got ready for presidents. Nothing is easier, as they have shown, than for a nation to thrust the past out of its institutions; but no human power can get the past out of a nation's character.

We suppose there is no liberal in the world who would not heartily rejoice to see France in possession of an orderly, democratic government; but the reasons for believing that this great consummation is not within her reach are, unhappily, not far to seek; and some of the weightiest have been brought into very disagreeable prominence by the crisis through which she is now passing. As a general rule, it may be said that a people's success in carrying on a government will depend on their truthfulness; and by truthfulness we do not mean simply the habit of speaking the truth in the transaction of the ordinary business of life, but readiness to face facts just as they stand, without blinking them, or arranging drapery about them, or throwing artificial light on them. This disposition of mind is familiar to everybody as a fundamental condition of success in business; in fact, it forms the most prominent feature in the character of the personage known as "the good business man;" but it is just as essential to the good politician. Now, without admitting the complete accuracy of the witty saying that "the Celtic mind is engaged in a perpetual struggle to escape from the control of facts," it cannot be denied that the attempts the French have hitherto made to govern themselves have been characterized by a strong dislike of facts, and a sort of desperate determination not to be governed by them, but by some ideal with which the formation of facts had nothing to do. This tendency was strikingly manifested in 1789; it was still more strikingly manifested in 1848; and the downfall of the republic in both cases was due to the arrival at the surface of affairs of men with the sort of truthfulness which consists in seeing facts just as they are, and governing one's self accordingly. The possibility of maintaining a republic in a country blessed or burdened with such traditions as France possesses, in conjunction with a strong executive and a large standing army, of combining love of liberty with love of glory, and the constant exaltation of brute force with popular reverence for law, is a pure product of the imagination. No man could have entertained that notion who had trained himself to look facts in the face. The Bonapartes have owed their rise to their keen and rapid perception of its absurdity, and the fortunate concurrence of circumstances which enabled them to act on their perception.

Another thing necessary to a republic is, that the people should have something in the nature of reverence for a certain order of ideas, or certain legal formulæ—should, in short, strongly incline to and be accustomed to one kind of government rather than another; should, for instance, possess more respect for the acts of a legislature than for the decrees of a monarch, or for the process of a court of law than for a military order. Now, to the great body of the French people all these things possess about equal value and equal claims to obedience. The number of persons in France who are really shocked by the irresponsibility of public functionaries before the courts, and by the power of arbitrary arrest and imprisonment which this places in the hands of the police, and which every régime has kept up, might easily assemble in one New York parlor. To the great body of the population, these things are not only natural, but necessary. In short, a republic must have as a basis either a very high order of mental and moral training, on the part of the mass of the people, or else a whole system of political habits, which will take the place of the conclusions of philosophers and historians. Prévost-Paradol held that the writ of *habeas corpus*, and the responsibility of government officers in damages for abuse of their authority, and a regulated liberty of the press, were necessary to a free government; but he had reached these conclusions through prolonged study and reflection. An Ohio farmer, with only twelve months' schooling, without any reflection at all, would laugh at anybody who questioned them. He holds them as ultimate facts of life, just as he holds the propriety of wearing clothes or paying his debts.

But the French not only have no special faith in any set of political ideas or any particular form of government, but have no attachment, even through the imagination, to any of the proposed plans of government. There are three things possible in France—a legitimist monarchy, an Orleanist monarchy, and a republic. There is not one of them to which any considerable or influential portion of the people is attached. There is not one of them which the nation has not seen overthrown with indifference or approval. There is probably no sentiment more completely dead in French hearts than the sentiment of loyalty. There is one thing, and one thing only, which the majority of Frenchmen ardently desire in the matter of government, and that is security. Any government which can supply this in combination with a fair share of "glory" may be pretty sure of everything in the shape of devotion which the Frenchmen of this generation are capable of feeling towards the powers that be; but security they will have, and they will sacrifice everything else for it. The Republic was proclaimed after the fall of the Empire, not because it was what the French people wanted, but because, as has been said, "it was what there was least division of sentiment about;" or, in other words, it was the form of government which has to be set up when nothing else offers, and it was set up, just as the Orleanist monarchy was set up, and as the Republic of 1848 was set up, and as the Empire was set up, by a *coup d'état*. Whether the legislature of a country be set upon and turned out of doors by the general of the army, or by a mob rushing in from the street, makes, as far as the effect on the political education of the people goes, little difference. A nation which has once grown accustomed to seeing governments it has organized, voted for, and obeyed destroyed in this way, as the French nation has, has fallen into a slough from which nothing but a long course of training or a special interposition of Providence can extricate it.

It is always dangerous as well as presumptuous to attempt much in the way of political prediction; but the outlines of the situation in France are so strongly traced that almost anybody can follow them without much speculation. If anything can be safely deduced from a nation's history or character, we may safely conclude that, whatever government makes peace with the Prussians, whether on Bismarck's terms or Favre's, is sure to be overthrown with ignominy, and become an object of great odium and ridicule. The Constituent Assembly will be composed, as the last was, very largely of conservatives sent on by the peasantry and landed proprietors and priests to look after the interests of property and religion. They will draw up a constitution which will be, perforce, republican in form, but they will not dare to leave the government or property in the great towns at the mercy of the Reds; and the Reds, in the period succeeding the war, will probably be unusually violent and threatening. Nor will they venture to treat the terrible wounds inflicted on the national pride by the war either as irreparable or of small consequence. The Republic will consequently either be saddled as before with a strong executive officer at the head of a large standing army, or will, as a defence against another *coup d'état*, commit the executive power to a commission of the legislature, an arrangement which will make the general in command of the army inevitably very formidable and the army difficult to manage; for nothing would irritate the French army more than to feel that it was in the hands of a small coterie of civilians, and it would probably rally round any chief who promised it deliverance from what it would regard as a humiliating and ridiculous situation. If he then began to intrigue on behalf of himself, or on behalf of the Orleans princes, or on behalf of something else than the Republic, and at last got into open collision with the legislature, it would be what experience justifies us in expecting. If, too, the Reds, disgusted with what they would very naturally regard as a sham Republic, should indulge in violence both of speech and behavior for the express purpose of driving the authorities into a recourse to military measures, and should at last succeed in causing the disappearance or violation of most of the constitutional provisions for the protection of individual rights, it would also be what experience warrants us in expecting. In short, there is nothing which our observation justifies us less in expecting than that a few devoted and enthusiastic men in Paris can, by willing a Republic, make one. Of course it may be said that by pretending to believe it possible we help to make it possible. But, for our own part, we believe that all real reforms in the world must rest on the sober recognition of the facts of life, and that he is the worst enemy of the French, as of all, who helps people in the practice of any of the pleasing little games in which so many of our progressive men try to forget the hard, stern work of the world.

THE FUNDING BILL AND THE RATE OF INTEREST.

The persistent and indefatigable Secretary of the Treasury has given notice that he is about to give notice that he will shortly be prepared to receive subscriptions to the new national loan into which he proposes to fund the existing six per cent. bonds of the United States. As this elaborate preliminary announcement of some probable future act, which may without discredit be left undone, looks somewhat like a mere attempt to feel the financial pulse, we might, after the repeated consideration bestowed in these columns upon Mr. Boutwell and his funding schemes, be excused for awaiting in silence the result of this disguised enquiry, were it not that the interest excited by other recent national loans—an illustration of which will be found among our correspondence to-day—tends to throw entirely new light upon the prospects of our own Treasury in its attempts to reduce the rate of interest upon the national debt.

Under the act of July 14, 1870, which Mr. Boutwell pressed through both branches of Congress with such feverish anxiety and at so great a sacrifice of official dignity that every one was justified in looking long since for the announcement of its complete success, he is authorized to issue in all $1,500,000,000 of new bonds: $200,000,000 at 5 per cent., $300,000,000 at 4½ per cent., and $1,000,000,000 at 4 per cent. He is not allowed to sell any portion of these bonds for less than par in gold, but he may exchange them, bond for bond, for other United States bonds bearing 6 per cent. interest. It is evident from Mr. Boutwell's notice of his intention to give notice that he expects either to make sales or else to have bonds presented for exchange. It is equally evident that, under the terms of the act, he will have a better prospect of selling or exchanging the 5 per cent. bonds than those bearing a less rate of interest. If, therefore, it should be found that the prospect of selling or exchanging the 5 per cent. bonds is a very slight one, it would not be necessary to dwell upon the prospect for the 4 and 4½ per cent. bonds.

The 5 per cent. bonds now out, known as ten-forties, and in no essential particular different from the proposed new issue, sold in this market on Saturday, October 22, at 106¾ in currency, or, at the then ruling premium of 113 for gold, equal to 95 in gold, or just five per cent. below par. On these bonds there had then accumulated one and three-quarters months' interest, or precisely three-quarters of one per cent. in gold. Deducting this accumulated interest, American buyers were willing to give just 94¼ for the 5 per cent. bonds then in circulation. Why in all the world should Mr. Boutwell expect that American buyers should give him 5¾ per cent. more for his new bonds than they can buy precisely similar old bonds for, without the annoyance, risk, delay, and red-tapeism of a Treasury bargain? The general belief among the honest supporters of a funding scheme seems to be, that with the decline in gold by some mysterious process the value of the bonds will advance, until our domestic investors will be willing to pay par and even more for a 5 per cent. bond. But it is very clear that the decline in gold every day reduces the currency income received from all gold-bearing securities, and to that extent lessens their value as an investment. The decline in gold, even if it continues, will not therefore necessarily advance the market value of bonds for home investment. It is very true that heretofore, that is to say, within the last two years, an average decline of twenty per cent. in gold has not been accompanied by a corresponding decline in the currency price of bonds; but this firmness has not been due to the domestic demand for them, it has, on the contrary, been accompanied by a steady selling-out on the part of American holders, who have, wisely or unwisely, preferred to buy railroad and other mortgage securities, which yield, or are promised to yield, a much higher rate of annual interest. The exchange of Government bonds for railroad and other securities continues up to the present moment without interruption, and unless some very startling event should supervene to destroy confidence in this class of investments, any further decline in gold would only tend to increase it. It is not at all likely, therefore, that the expected decline in gold will advance the price of our bonds through any purchases by American investors.

The reason why, in spite of the decline in gold, and in spite of the steady selling by domestic holders, American bonds have failed to decline, is simply that they have been bought by foreign investors; and the question immediately arises, will foreign investors continue to buy—will they buy in sufficient quantities to maintain the price—will they buy enough to advance the price to a point where Mr. Boutwell can sell his new four, four and a half, or five per cent. bonds at par? It is on this point that the recent experience of Europe and the probable immediate future seem to throw enough new light to warrant a recurrence to this threadbare topic.

We have more than once referred to the recent loan of the North-German Confederation, of which a correspondent gives us the only trustworthy account we have so far met with. This loan for a limited amount, offered by the Government in the midst of most marvellous military successes, while money in the principal financial centre was a drug at two or three per cent. per annum, was a comparative failure. A five per cent. bond, for which Mr. Boutwell expects to get par, was offered at 88, twelve per cent. *below* par, and of 125,000,000 offered, only 80,000,000 were subscribed. It is true that the unsubscribed balance was entirely withdrawn from the market, and that the bonds actually issued have since advanced from 88, the issuing price, to 94 or 94½, or precisely the same figure at which American bonds are quoted that bear the same rate of interest. But the fact remains that the five per cent. bonds of the nation which holds by far the largest amount of our securities, and whose credit can in no sense be considered inferior to our own, are not readily taken *at home* at five or six per cent. below par. Why should we expect the same people to take ours at par and over? Would peace, if declared to-morrow, alter this state of affairs? Scarcely any thinking person doubts that peace would almost immediately bring France, as well as every German state, into the markets of the world as borrowers. Would this additional competition improve the demand for our bonds? The competition of governments is not even the only competition to be considered. Since the breaking out of the war, the idle transferable capital of both Germany and France has been added in large amounts to the idle capital of England, swelling the coin reserve of the Bank of England to almost unprecedented figures, and reducing the interest rate for money in London to a merely nominal one. A considerable portion of this idle capital is reported to have been temporarily invested in American securities, thereby helping to maintain the price under the sales of both German and American investors. Peace will not only restore this idle capital to its former owners or employers, but will create a demand for further amounts of English capital, to be employed in repairing the waste and destruction of war. Who does not remember how, from 1865 on, and to this present day, the capital of the world has been pouring into our country to replace what we had destroyed? Something similar, though less in degree, will no doubt take place in France after peace, and to some extent even in Germany. The capital of all nations will be in a measure drawn upon to repair *their* waste. While thus the individuals of two great nations are likely to compete with their own governments for the idle capital of the world, it would be palpably unreasonable to expect a decline in the ruling rates of interest in the European money-markets. And if, at the extremely low rates of interest recently prevailing, bonds as good as our own could not be sold in the home market better than 94, or six per cent. less than par, it does not seem sound reasoning to expect that ours will advance to par, *as interest becomes higher and money scarcer*. And again, if there is little probability of Mr. Boutwell getting par for his $200,000,000 of five per cents., how much probability is there of his getting par for his $300,000,000 of four and a half per cents., or his $1,000,000,000 of four per cents?

"Banks and responsible bankers will be designated for the negotiation of the loan, and paid a commission upon the amounts negotiated by them respectively." There may lie hidden in this clause, or in some other part of Mr. Boutwell's programme, a charm of potent virtue to stimulate the foreign or domestic banking interest to overcome the laws of trade and finance. But to the insight of all ordinary financial observers, Mr. Boutwell's resumption of his funding scheme at this momemt is only one more illustration of his complete inability to recognize the essential fact: that the finances of any one great nation cannot be administered successfully without some regard to the financial situation of other nations of equal rank. Congress or the Secretary of the Treasury may decide upon the rate of interest they would *like* to pay. But the rate they will be *obliged* to pay is not settled by them, but rather by a silent and unconscious congress of other nations, whose verdict is not announced in "notices of an intention to give notice," but is quietly recorded upon the price-lists of two or three stock exchanges. Unless we much misread the signs, that record is likely to be that some time must yet elapse before we can hope to refund our debt at 4, 4½, or even 5 per cent.

THE COMPARATIVE MORALITY OF NATIONS.

WE had, four or five weeks ago, a few words of controversy with the *Christian Union* as to the comparative morality of the Prussians and Americans, or, rather, their comparative religiousness—meaning by religiousness a disposition "to serve others and live as in God's sight;" in other words, unselfishness and spirituality. We let it drop, from the feeling that the question whether the Americans or Prussians were the better men was only a part, and a very small part, of the larger question, How do we discover which of any two nations is the purer in its life or in its aims, and is not any judgment we form about it likely to be very defective, owing to the inevitable incompleteness of our premises? We are not now going to try to fix the place of either Prussia or the United States in the scale of morality, but to point out some reasons why all comparisons between them should be made by Americans with exceeding care and exceeding humility. There is hardly any field of enquiry in which even the best-informed man is likely to fall into so many errors: first, because there is no field in which the vision is so much affected by prejudices of education and custom; and, secondly, because there is none in which the things we see are so likely to create erroneous impressions about the things we do not see. But we may add that it is a field which no intelligent and sensible man ever explores without finding his charity immensely stimulated.

Let us give some illustrations of the errors into which people are apt to fall in it. Count Gasparin, who is a French Protestant, and as spiritually-minded a man as breathes, once talking with an American friend, expressed in strong terms his sense of the pain it caused him that Mr. Lincoln should have been at the theatre when he was killed, not, the friend found, because he objected in the least to theatre-going, but because it was the evening of Good Friday—a day which the Continental Calvinists "keep" with great solemnity, but to which American non-episcopal Protestants pay no attention whatever. Count Gasparin, on the other hand, would have no hesitation in taking a ride on Sunday, or going to a public promenade after church hours, and, from seeing him there, his American friend would draw deductions just as unfavorable to the Count's religious character as the Count himself drew with regard to Mr. Lincoln's.

Take, again, the question of drinking beer and wine. There is a large body of very excellent men in America who, from a long contemplation of the evils wrought by excessive indulgence in intoxicating drinks, have worked themselves up to a state of mind about all use of such drinks which is really discreditable to reasonable beings, and leads to the most outrageous platform excesses, and, we are sorry to say, to considerable unscrupulousness of speech, and is perfectly incomprehensible to Continental Europeans. To the former, the drinking even of lager bier connotes, as the logicians say, ever so many other vices—grossness and sensuality of nature, extravagance, indifference to home pleasures and repugnance to steady industry, and a disregard of the precepts of religion and morality. To many of them a German workman, and his wife and children, sitting in a beer-garden on a summer's evening, which to European moralists and economists is one of the most pleasing sights in the world, is a revolting spectacle, which calls for the interference of the police. Now, if you go to a beer-garden in Berlin you may, any Sunday afternoon, see doctors of divinity—none of your rationalists—but doctors of real divinity, to whom American theologians go to be taught, doing this very thing, and, what is worse, smoking pipes. An American who applied to this the same course of reasoning which he would apply to a similar scene in America, would simply be guilty of outrageous folly. If he argued from it that the German doctor was selfish, or did not "live as in the sight of God," the whole process would be a model of absurdity.

Foreigners have drawn, on the other hand, from the American "diligence in business," conclusions with regard to American character far more uncomplimentary than those the *Christian Union* has expressed with regard to the Prussians. There are not a few religious and moral and cultivated circles in Europe in which the suggestion that Americans, as a nation, were characterized by thoughtfulness for others and a sense of God's presence would be received with derisive laughter, owing to the application to the phenomena of American society of the process of reasoning on which, we fear, the *Union* relies. Down to the war, so candid and perspicacious a man as John Stuart Mill might have been included in this class. The earlier editions of his "Elements of Political Economy" contained a contemptuous statement that one sex in America was entirely given up to "dollar-hunting," and the other to "breeding dollar-hunters." In other words, he held that the American people were plunged in the grossest materialism, and he doubtless based this opinion on that intense application of the men to commercial and industrial pursuits which we see all around us, which no church finds fault with, but which we know, bad as its effects are on art and literature, really coexists with great generosity, sympathy, public spirit, and ideality.

Take, again, the matter of chastity, on which the *Union* touched. We grant, at the outset, that wherever you have classes, the women of the lower class suffer more or less from the men of the upper class, and anybody who says that seductions, accomplished through the effect on female vanity of the addresses of "superiors in station," while almost unknown here, are very numerous in Europe, would find plenty of facts to support him. But, on the other hand, an attempt made to persuade a Frenchman that the familiar intercourse which the young people of both sexes in this country enjoy was generally pure, would fail in ninety-nine cases out of a hundred. That it should be pure is opposed to all his experience of human nature, both male and female; and the result of your argument with him would be that he would conclude either that you were an extraordinarily simple person, or took him for one. On the other hand, we believe the German, who thinks nothing of drinking as much wine or beer as he cares for, draws from the conduct of the American young women whom he sees abroad, and from what he reads in our papers about "free love," Indiana divorces, abortion, and what not, conclusions with regard to American chastity very different from the *Union*; and, if you sought to meet him in discussion, would overwhelm you with facts and cases which, looked at apart from the general tenor of American life and manners, it would be very hard to dispose of. He would say, for instance, that we are not, perhaps, guilty of as many violations of the marriage vow as Europeans; but that we make it so light a vow that, instead of violating it, we get it abrogated, and then follow our will; and then he would come down on us with boarding-house and hotel life, and other things of the same kind, which might make us despise him, but would make it a little difficult to get rid of him.

There is probably no minor point of manners which does more to create unfavorable impressions of Europeans among the best class of Americans—morally the best, we mean—than the importance attached by the former to their eating and drinking; while there is nothing which does more to spread in Europe impressions unfavorable to American civilization than the indifference of Americans, and, we may add, as regards the progressive portion of American society—cultivated indifference—to the quality of their meals and the time of eating them. In no European country is moderate enjoyment of the pleasures of the table considered incompatible with high moral aims or even a sincerely religious character; but a man to whom his dinner was of serious importance would find his position in an assembly of American reformers very precarious. The German or Frenchman or Englishman, indeed, treats a man's views of food, and his disposition or indisposition to eat it in company with his fellows, as an indication of his place in civilization. Savages love to eat alone, and it has been observed, in partially civilized communities relapsing into barbarism, that one of the first indications of their decline was the abandonment of regular meals on tables, and a tendency on the part of individuals to retire to secret places with their victuals—probably a remnant of the old aboriginal instinct which we still see in domesticated dogs, and which was, doubtless, implanted for the protection of the species in times when everybody looked on his neighbor's bone with a hungry eye, and the man with the strong hand was apt to have the fullest stomach. Accordingly, there is in Europe, and indeed everywhere, a tendency to regard the growth of a delicacy in eating, and close attention to the time and manner of serving meals and their cookery, and the use of them as promoters of social intercourse, as an indication of moral as well as material progress. To a large number of people here, on the other hand, the bolting of food—ten-minute dinners, for instance—and general unconsciousness of "what is on the table," is a sign of preoccupation with serious things. It may be; but the German love of food is not necessarily a sign of grossness, and that "overfed" appearance, of which the *Union* spoke, is not necessarily a sign of inefficiency any more than leanness or cadaverousness is a sign of efficiency. There is certainly some power of hard work in King William's army, and, indeed, we could hardly point to a better illustration of the truth, that all the affairs of men, whether political, social, or religious, depend for their condition largely on the state of the digestion.

Honesty, by which we mean that class of virtues which Cicero includes in the term *bona fides*, has, to a considerable extent, owing, we think, to the peculiar humanitarian character which the circumstances of the country have given to the work of reform, been subordinated in the United States to brotherly kindness. Now, this right to arrange the virtues according to a scale of its own is something which not only every age but every nation has claimed, and, accordingly, we find that each community, in forming its judgment of a man's character, gives a different degree of weight to different features of it. Keeping a mistress would probably, anywhere in the United States, damage a man's reputation far more seriously than fraudulent bankruptcy; while horse-stealing, which in New England would be a comparatively trifling offence, out in Montana is a far fouler thing than murder. But in the European scale, honesty still occupies the first place. Bearing this in mind, it is worth any man's while who proposes to pass judgment on the morality of any foreign country to consider what is the impression produced on foreign opinion about American morality by the story of the Erie Railroad, by the career of Fisk, by the condition of the judicial bench in the commercial capital of the country, by the charges of corruption brought against such men as Trumbull and Fessenden at the time of the impeachment trial; and by the comically prominent and beloved position which Butler has held for some years in our best moral circles, and by the appointment of such a man as Sickles as a national representative, and by the condition of the civil service.

The truth is that it is almost impossible for anybody to compare one nation with another fairly, unless he possesses complete familiarity with the national life of both, and therefore can distinguish isolated facts from symptomatic facts. The reason why some of the phenomena of American society which shock foreigners greatly do not shock even the best Americans so much, is not that the latter have become hardened to them—though this counts for something—but that they know of various counteracting and compensating phenomena which prevent, and are sure to prevent, them in the long run from doing the mischief they seem to threaten. In other words, they understand the checks and balances of their society as well as its tendencies. Anybody who considers these things will be careful how he denounces people whose manners differ from his own for want of spirituality or morality, and we may add that any historical student engaged in comparing the morality of the age in which he lives with that of any other age which he knows only through chronicles, will do well to exercise the same caution for the same reasons.

WHAT CITIZEN-SOLDIERS MAY DO FOR FRANCE.

NEAR TOURS, October 8, 1870.

SLIGHT as it may be, there is an undoubted change for the better; faint as it is, there is the possibility of a ray of hope. There is this possibility, because, through the most frightful misfortunes that have ever crushed a nation in modern times, the situation of France seems likely to become a true instead of a false one.

I must explain. So long as France was fighting for institutions and ideas of the past, the situation was a false one; as false as it would have been if the ghosts of the volunteers of 1792 had risen from their graves to fight with an Austrian army against Italian freedom. So long as France fought thus, she was doomed, for her German adversary represented a higher and more forward state of civilization than she did.

Now, it was not merely the fact of fighting for the maintenance of Imperial despotism which condemned France to retrogradism and therefore to defeat. It was something worse, even, and more radically false than this: it was the belief in the *professional* soldier, in the hired butcher set apart, fed, and fattened for the sole purposes of dynastic massacre—the most hideous of all remnants of the dark ages in this our age of light. Unable to understand the pure national power which, armed for the right, struggled on through four years to ultimate and inevitable victory in the United States; convinced that the German element of weakness would be found in that which constitutes its strength—in its all but countless regiments of armed citizens—France relied on the professional cut-throat, and fell. She believed to the very hour of her disgrace that the honor of a country can be surely defended by those who are either more or less than men—tyrants or slaves, as the case may be, never plain, honest men—and, leaning on this utterly obsolete creed, she gave way.

But there is a higher, fuller national life in France than this, and if *that* is developed in her to its utmost she may yet be saved. Now, at the present hour, and not at Reichshofen or Sedan, is the crisis of her fate. If she can rise to the level of our time, if she can once discard the fictions of the past, and learn that by their worth are nations powerful, and that no worth is above that of a duty-loving, true man—that right is always easy to uphold, and that standing armies are only needful to support possible wrong—if France can learn this, she will eventually drive the Germans from her soil.

Herein lies the truth of the situation of this country; and if I have ventured to speak of a ray of hope, however faint, it is because I think I see certain signs of a proper apprehension of things as they really are in the French. There are many in Tours who, thank God! agree with me in all this, and circumstances seem to be forcing on all the creed which is that of our age. Wherever the mere professional soldier appears in this war, he is beaten—not merely beaten, but panic-stricken, and he flies in abject terror. There is no worth in the man, for the plain reason that he is not a man, but an instrument, a machine. Not all the preaching or scolding or shooting of General Trochu, or any other general, will infuse the requisite ardor into these wretched linesmen or Zouaves; they have no worth—they must go—they are of the past; and in their place must rise up the citizen-soldier, the man of this our time; the man who, for defending what he defends—his home, his loved ones, his right to live in freedom and peace—is more a man, a man in a higher and better sense than before.

Now, as I said, there are certain signs—faint and far between as yet—that this is in progress; and when it becomes the general condition of things, France will be saved, for France will then be stronger than Germany. The moment that to the million of armed men of Germany France opposes the two or three (or, for that matter, four) millions of French citizens, fighting to defend their liberty and their homes, France becomes invincible; because, if she gets rid of her belief in professional butchers, she represents a larger amount of liberalism than does Germany; and Germany knows it. Politically and socially, all Germany (and even Prussia) is still shackled by feudal customs and distinctions, whereas, if France resolves to deserve, she is in advance of the whole of Europe. Her weakness has been her readiness to let slip the radical gains of the Revolution of '89. Having secured equal rights and a relative degree of freedom, she allowed military glory to dazzle her, and utterly lost sight of the fact that the worth and power of a nation depend on the worth of its individual sons. The present lesson is a severe one, but perhaps nothing less would have sufficed; and if this lesson is duly learnt by the French, no price can be esteemed too high for it.

I have said that everywhere the beaten armies have proved worthless; but there are signs that the young citizen troops may not be so. Such a revolution as France is now going through must needs proceed slowly, and step by step. Well, the steps taken hitherto are favorable to the energetic, though it may be inexperienced, defenders of the soil. At the first sortie made by the garrison of Paris the Zouaves ran away like scared rabbits, whilst the Mobile Guard stood its ground manfully, and, when forced by the panic of the professional soldiers to retreat, retreated in good order. Since then, on every occasion where the armed civilian has been called into action, he has done his duty, and on more than one occasion has succeeded in routing the enemy. Three days ago, the dislodging of the Prussians from several small points occupied by them in the neighborhood of Orléans was again the work of the Garde Mobile, and, in truth, this is the first *serious* success of the second campaign. On the other hand, the correspondents of the London *Times* all record the mischief done on the line of the Vosges mountains by the local free-shooters; and throughout the north and northeastern parts of France you may now hear of Francs-tireurs having managed to intercept provision-wagons or repulse reconnoitring detachments. All this, you will say, is very little when compared to the tremendous gains of an army that has swept away in forty days the entire army of Imperial France. So it is; but I set out by saying that the possibility of hope was the very smallest in the world, and it must also be remembered that Imperial France is what has been ruined (and most righteously so), and that what is now attempting the gigantic work of salvation is Republican France. It is not because here and there a few skirmishes have within the last week ended favorably for the French that even the faintest ray of hope is allowable; it is because each of these miniature successes has been achieved by the pure democratic element, by the citizen armed for the defence of his home, and not by the professional soldier—by the slavish instrument whose monstrous trade it is to fight, and do nothing save fight. Let there be time for the nation to rise here and resolve upon resistance, and the Germans may yet be expelled, for they have this time the disadvantage of being the aggressors, and more than one respected and honored voice in Germany is raised to remind them energetically of this.

There can be no doubt that since Count Bismarck refused the offers of peace made to him by Jules Favre, he has morally changed the relative positions of the two countries, and taken upon himself a responsibility almost as heavy as that assumed by Louis Napoleon in the month of July. When the King of Prussia agreed to the abandonment of the claim of Prince Hohenzollern to the Spanish throne, war need never have broken out; and by forcing it on, Louis Napoleon committed the most heinous crime that modern history chronicles. He committed it for purely selfish, dynastic (and, probably, pecuniary) ends. He paid for his guilt. When the destruction of the entire French army, and the annihilation of the shameful and dangerous Empire, had made France harmless for aggressive purposes, and when the men at the head of the new Government frankly avowed the wrong she had been made to share, and courageously said she must bear the penalty of it, then peace might have been made, the war *need* no longer have gone on, it might have been quickly and most honorably ended for both sides. And by determining upon its continuance, Count Bismarck and his master have committed an undoubted wrong, sacrificing, as did Louis Napoleon, what was just and right and Christian for dynastic and selfish ends—for the mere lust of conquest.

To succeed rapidly and completely becomes, therefore, now as great a necessity for Count Bismarck as it was for Louis Napoleon when he unjustifiably declared war upon Prussia. If the German armies, having now assumed the part of aggression, can enter Paris quickly without paying very dearly for this satisfaction, such bystanders as have no rule for their judgments save success will say Count Bismarck was right in rejecting peace, and that in so doing he "knew what he was about;" in this case, he can inflict his own terms, leave France resolved to seize the first opportunity for making war anew, and disperse to the winds all and any notion of disarmament in Europe. But if the French *nation* rallies—if by the virtue of republicanism men, money, and arms are forthcoming throughout the land, and the prolonged resistance of Paris forces the Germans to pay a very high price for entering it, that price will probably be voted too high, and the terms of peace will be modified by the invaders. It must not be forgotten that Germany has obtained already all, and more than all, she wished for; she has secured her absolute unity; she may be "the empire" once more if she chooses, or a federation, or whatever she likes best; she is utterly her own mistress, and becomes, without doubt, the strongest power in Europe. Nor must it be forgotten how just and reasonable a people are the Germans generally, how devoid of mere glory-hunting tendencies.

If, then, I say again, there is such a genuine upheaving of the national spirit in France as to oppose to the invading (and now aggressive) Germans an armed and determined *nation*, the Germans will have to retire. In that case, they will have to do so because they themselves will admit that the price to be paid for Paris is too dear, and because a really strong republic will always be stronger than any monarchy.

Correspondence.

THE PRUSSIAN WAR LOAN.

To the Editor of the Nation:

Sir: The *Nation* of the 8th instant, amongst other most valuable and excellently written articles, contains the one headed "Prussian War Loans." (This expression is not quite correct, for it is the loan of the North-German Confederation.) This article, written evidently with some very good knowledge of financial matters in general and of Prussian financial affairs in particular, is only to some extent correct in its arguing and trying to prove the loan an utter failure. Pardon, therefore, my endeavor to correct some misstatements which, in my opinion, led the financial writer of the *Nation* into some errors.

1. I cannot call the not taking up of the loan in full a "total failure," since of the 125 millions only about 80 were offered to the public, and actually a subscription of about 66 millions took place.

2. The insufficient taking up of the loan cannot be considered a "surprise," since, although the commencement of the article speaks of the *favorable terms* of the loan, yet in the further arguments, and more particularly by comparison with the then quotation of the 6 per cent. American bonds, it proves that the terms were by no means favorable—the issuing price of the loan being 88 per cent. and the 5 per cent. Prussian stocks being down as low as 82 per cent. And to this reason, chiefly, I attribute the failure (though not *utter* one) of the subscription.

Besides this, it was a mistake on the part of the Treasury to make Berlin the chief subscribing place, for though one might subscribe at any other place of the Northern Confederation, he was charged with the cost of transmission, chiefly postage to and fro, on the amount paid up as, or deposited for, security—and in Prussia the charge is rather heavy for registered money-letters—and other accumulating costs, which amounted in all to about ½ per cent., thus lessening the "favorable terms." Had this mistake not been made, a good many smaller cities would have participated in the subscription, for there is more "idle money" (one of the three sources spoken of) in these small towns than at the capital or the chief provincial cities. At places where "exchanges" exist, every penny of idle money is immediately invested, either in speculation or for interest, which the minor places have less chance to avail themselves of.

I doubt whether the loan would have been more successful if Prussia had opened the subscription at foreign markets also, or if Prussian stocks had had a quotation at places out of her own borders. Had this latter been the case, Prussia would have been obliged to take up a large amount of returned stocks, and I think Prussia was saved a good deal of financial embarrassment by her stocks not being in foreign markets. In proof of this, take the return to France, chiefly from England, of an immense amount of French "rentes" at the time of issuing the new French loan, causing a depression of at least 3 per cent., or rather 3 in 65.

It is stated that the true nature of the negotiation has not transpired. Begging your pardon, it has, and the statement of the correspondent of the New York *Tribune*, telegraphed on the 18th of August, that 40 millions were sold at 63, is not only incredible, but decidedly incorrect, to use no stronger phrase. For it is well known here (and every banker at this place will affirm it) that 80 millions only were offered for subscription; that 66 millions were actually subscribed for; that the remaining 14 millions were taken up by the Seehandlung at above 88 per cent. (not 63), and that the unissued 45 millions are up to this moment not even brought into the market. An application of a party of Berlin bankers (Mr. Bleichröder, agent for Rothschilds, at the head of it) to take those 45 millions at 94 per cent. was rejected, the Government stating that it wanted no more ready cash at present.

By the bye, the Seehandlung, of which the article speaks rather disparagingly, stating the establishment to have dwindled down from the position of a "Matschapey" or East India Company to a Crédit Mobilier or Crédit Foncier, is no more than a financial agent of the Government, like any other banking establishment. Those two French Imperial institutions, which are mostly answerable for the financial ruin of France, have ruined through their swindling transactions (benefiting only the Péreires, Mornys, and a few others) thousands of French families. The Seehandlung could never take up, with a capital stock of 12 millions only, a subscription of 60–70 millions without being looked upon as a swindling establishment. For with a loss of 20 per cent. only on so heavy a sum—and in war-times such a loss is easily possible and would have been quite certain had Germany been less successful in repulsing the shameful French attack—the establishment would have been ruined. Calling such a transaction a mere blind to hide the Treasury defeat is an ill-chosen accusation against the establishment as well as against the Government, for, thank heaven, in Prussia financial matters are all so much above-board that such illegal proceedings could not well be hidden, since the Government as well as the Seehandlung are responsible for their respective budgets to the legislature of the country. It has hardly been heard of that transactions of a cloudy nature were ever entered into by Prussian ministers with their subaltern officials, and such are the directors and board of administration of the Seehandlung.

Finally, I believe the failure of the subscription is *chiefly* to be attributed to the high price at which it was issued, as is easily proved by comparison with the price of American 6 per cent. bonds then made, viz., 80 per cent.

$1,000 6 per cent. at 80 per cent. or at 1 5-12 R. Th. = R. Th. 1133.10, giving at 6 per cent. R. Th. 85 interest.
R. Th. 1,000 5 per cent. at 88 per cent. = R. Th. 880, giving at 5 per cent. R. Th. 50 interest.

Capital has neither conscience nor patriotism, and it is, therefore, not to be wondered at that a good many people rather held their American 6 per cent. bonds (not to speak of the difference in the security between a bond of a state that enjoys peace and a loan issued by a Government that stands before a struggle of such magnitude as a war between Germany and France) than sell and exchange them for a *dearer* 5 *per cent. war loan.* And the proof of this financial pudding is in the eating. Let me invite you to the dinner to-day, at 12 o'clock, at the Berlin exchange:

1,000 R. Th. at 96 = R. Th. 960, against R. Th. 880, as above;
$1,000 at 95 = $950, R. Th. 1345.25, against R. Th. 1133.10, as above,

besides the difference of 1 per cent. per annum interest. On about 700 million dollars invested in American bonds in Germany, the difference of *profit* amounts in these few weeks to more than one-half of the whole war-loan.

I think I have proved the contrary to the "*surprise*" of the *Nation*, and, in my opinion, it would have been a surprise if the loan had been taken up in full or subscribed for above the sum total. It was not cheap enough, and German capitalists know how to calculate; that is the reason of the failure. Patriotism has nothing to do with it.

R. W. & Co.

BERLIN, September 27, 1870.

[We take pleasure in making room for the foregoing communication, the signature to which will probably be recognized by many of our readers among business men as that of one of the leading banking-houses of Prussia. It is especially interesting to us as admitting in the main the fact at which we then expressed our surprise, viz.: that in spite of the marvellous war enthusiasm of Germany, a loan on favorable terms for a very small sum had been virtually a failure. With the imperfect knowledge of the facts then in our possession, many of which (like the *Tribune* telegram referred to by our correspondent and discredited by us at the time) have since proved to be untrustworthy, we sought to explain this remarkable anomaly. Our correspondent takes exception to our statement of the facts, and repudiates our explanation. With regard to the latter we must be permitted to adhere to our own opinions, which are not, indeed, controverted by R. W. & Co. But with regard to the former we are bound to accept our correspondent as an authority not to be questioned, and hence recommend his statement to our American readers as the only complete and trustworthy one which we have met with anywhere.

An interesting feature of our correspondent's letter is the unquestioning faith in American securities, the safety of which is, in this case certainly, as we have always claimed, admitted to surpass that of any loan offered by any European nation in times of war. But it is also noticeable that we should be warned, by the example of France and the anticipations of Prussia, of the fate likely to overtake our own finances in case of war here.

The indignant rejection of our qualified comparison of the Seehandlung with the Crédit Mobilier, and the emphatic defence of the Prussian Government against our implied charge of financial "manœuvring," is an illustration of the spirit of honesty which has repeatedly been recognized in these columns as the foundation of German successes. That the balance which the Seehandlung subscribed for, and which repeated and detailed telegrams clearly showed to be a very large one, was in reality, as our correspondent explains it, only a much smaller sum, alters somewhat the nature of the transaction which we condemned; but it does not seem to us to remove the reproach, that the Government became morally compelled to subscribe nominally to a large part of its own loan. However, the very idea "that the responsibility of a financial institution to the legislature of the country" is considered proof positive "that illegal proceedings could not well be hidden," raises us to such heights of financial purity that our own financial atmosphere seems doubly pestilential and miasmatic by comparison; and possibly even that remnant of reproach may be undeserved.

The most striking statement of the whole letter is this, that the profit from the advance of American bonds held in Germany during a few weeks was sufficient to pay more than one-half of the entire war-loan. Query: Whose is the gain by this advance, and—whose is the loss?—ED. NATION.]

MR. WENDELL PHILLIPS'S "PHILOSOPHY."

TO THE EDITOR OF THE NATION:

SIR: I read with pain, though without surprise, your recent articles entitled "Tertullian in the Amphitheatre," etc., in which you treat of Mr. Wendell Phillips and his school of political thinkers. Your remarks betray a failure on your part to appreciate the true functions of these philosophers—for philosophers, believe me, they are, your authority to the contrary notwithstanding. I speak with the more confidence on this point as I once thought of them as you do now; but they demonstrated their superior wisdom in a method I could not ignore.

Let me illustrate my meaning. In his speech in Boston, on the 18th inst., Mr. Phillips thus defines his past and future sphere of utility: "Into everything, it (the Republican party) has been forced by an outside criticism—every single step. . . . What are we doing to-day? Just what we have done for ten years: watering the Republican party to make it grow; pressing it in order to make it act; drawing off somewhere by some method a force that shall compel its recognition of the duty of the hour. . . . Well, gentlemen of the press, correspondents, and editors, I belong to a section of men whose example taught you about all you know as to political matters. . . . I intend to teach you a great deal more before I get through."

Holding myself to be "an advanced thinker," I pronounce every word of this true, and find profit in my own individual experience. During the war of the rebellion, I was in the army. I saw no little service, and got some hard knocks. Then I had not attained the development of political thought which I hope I now have. I did my duty to the best of my ability, and fought the enemy before me. I almost laugh now as I recall my great but simple indignation, at that time, when Mr. Phillips, in opposing the re-election of President Lincoln, made his famous comparison between him (Lincoln) and a mud-turtle—coax him, drive him, turn him over; he only draws his head within his shell, and is impenetrable; if you want to make him move, put a live coal on his back. The Cleveland Convention was the "live coal," and Mr. Phillips applied it. At the time, the jeopardizing, in this way, all the results of the war made me very angry; from my position at the front, it seemed like a fire in the rear. I have, however, long seen how wrong I was, and how correctly Mr. Phillips judged. No one, I presume, will now deny that we owe the whole work of reconstruction to the Cleveland Convention.

Again, you doubtless remember Mr. Phillips's extreme ground in regard to Southern repression and confiscation. Here, too, he was right; again he was applying the "live coal" to the back of the mud-turtle. Our people were too generous, too good-natured, too merciful; I was myself, I know. Mr. Phillips took the extreme ground in order to force public opinion up to even a moderate degree of sternness, and the fruit of his labors is apparent to all in the present reliable and satisfactory Republican organization throughout the Southern States. This course was a painful one for Mr. Phillips, for he is always and ever a philanthropist—one who loves to bind up wounds and alleviate misfortune. How painful it was, you might, if you chose, form an idea from his recent utterances as regards Count Bismarck and France after the surrender of Sedan. There the philanthropist had full play, and the political teacher felt no duty incumbent upon him; his voice was loud and clear for mercy and humanity; he abhorred and denounced even a moderate exercise of the hard-won privileges of victory. The friend of men could afford a protest for prostrate France; the instructor of his countrymen had a duty to perform as regarded the conquered South; did he not, I ask you, perform it? Think you it was pleasant exacting that pound of flesh?

One point as regards Mr. Phillips has not been sufficiently dwelt upon; I wish now to do justice to it: I refer to his magnanimity. I do not think that even General Grant exceeds him in this respect. And the mention of Grant's name suggests an instance of the trait referred to in this very speech. You doubtless remember that Mr. Phillips was formerly bitterly opposed to the election of Grant; he opposed him politically, he opposed him morally. In a public speech, he referred to him as having been seen, on one important occasion, "drunk in the streets of Washington." No one will deny Mr. Phillips's devotion to the cause of temperance. The speech of last evening, from which I have quoted, was delivered by him as the candidate of the temperance party, and was largely devoted to that subject. If one thing could demand from Mr. Phillips a sterner sacrifice than another, it would be, under a sense of public duty, to place in the President's chair, as an example to all the land, a victim of intemperance. Here you see Mr. Phillips's magnanimity. In this Boston speech—made, mark you, as candidate of the Prohibition party, he frankly withdraws all his opposition to the President—he does more, he yields him a hearty support: "I care a great deal that Ulysses S. Grant shall be the next President of the United States." Is not this real magnanimity? The exponent of temperance, he yet recognizes in public servants other things more important than temperance. Overcome by the lofty policy, searching political reforms, elevated moral tone, and pure example of that Administration the selection of which he so bitterly opposed—unable to retract the painful charge which he evidently feels he had but too good occasion to advance—he yet silently ignores both his own past utterances and the principle of which he is the exponent, fairly vanquished by the lofty moral and political attitude of a great man.

Before, sir, you again exercise your wit at the expense of Mr. Phillips, ask yourself whether you could make the same frank confession of error to one as regards whom you had committed yourself by a censure equally harsh. Meanwhile, in a recent number of the *Nation*, you divided the class to which Mr. Phillips belongs into "the Cæsarists and the Sentimentalists." I certainly am not a Cæsarist, but you doubtless would set me down as A Sentimentalist.

Boston, October 19, 1870.

[We shall, perhaps, best dispose of the sophistries on which the above feeble production is based by stating the facts which our "Sentimentalist" tries so clumsily to manipulate. Mr. Phillips has been "in politics" just nine years. During that time he has proposed one grand piece of tactics, which was brought out at the Cleveland Convention—that is, the division of the Republican party in the most critical period of the war, for the purpose of procuring a change of Presidents, or, in other words, of throwing the whole administrative machinery of the country into confusion. What the result of this would have been, the American public then guessed at with tolerable clearness. Their previsions have since been curiously verified by what is passing in France. We there see what a change of administration under the guns of a determined enemy means. Had we tried it, Mr. Phillips would, doubtless, have consoled us as his brother, Victor Hugo, consoles the French, by "scathing" the enemy with epigrams. He next opposed the election of Grant on the ground that he was a street drunkard; and when Senator Wilson bore testimony to Grant's sobriety, he replied that Wilson was a shocking example of the badness of the men whom Democratic institutions brought to the surface, and that his denial that Grant was a drunkard satisfied him (Phillips) that it was only too true. He now, two years later, calls savagely before a prohibitory audience for the re-election of this same Grant. Our "Sentimentalist" calls this "magnanimity," which it may be, but it is something besides. The one great contribution which Mr. Phillips has made to the philosophy of politics is, "that you should never forget or forgive at the polls." He has for six months been hawking this chunk of wisdom round the country, exhibiting it to admiring crowds, and protesting that it is entirely his own work, which nobody ever doubted. But how can he expect even the most docile colored man to put much value on it, in the face of his own forgiving and forgetting in the case of the President, and his asking people at a temperance meeting to re-elect to the highest office in the country a man who has been seen drunk in the streets, and to whose sobriety Mr. Wilson has testified? It may be that there are Boston editors who have got their political training from Mr. Phillips; but if there are, they ought to give occasional *séances*, at which the public might be allowed to examine their bumps and specimens of their work. The later Phillips "ideas" run through the average brain of his editorial disciples, and would always be interesting at least as curiosities.—Ed. Nation.]

SCHOLARS IN THE PRUSSIAN ARMY.

To the Editor of the Nation:

Sir: Allow me to send you a little contribution to your further answer to "A. T."

In the battle at Mars-la-Tour, Aug. 16, fell Dr. Jul. Brakelmann; and in the battle at Rézonville, Aug. 18, Paul Herlth, both estimable and esteemed contributors to the *Magazin für die Literatur des Auslandes*, which is published in Berlin and ranks as high as any literary journal in Germany.

Brakelmann was lately in Paris, studying the Provençal and old French literature, and left Paris on July 17 in order to join his regiment. In 1866, he stood in the army of the Main under General Vogel von Falkenstein. He also was an occasional contributor of the *Augsburger Allgemeine Zeitung*.

Herlth was in Goldberger's banking-house in Berlin correspondent for Italy and France. In his leisure hours he studied modern languages, and gradually mastered most European tongues. Sanskrit he had studied at the University of Breslau. His translation of Calderon's "Life a Dream" was played in Weimar with great success. His latest work was a translation of Longfellow's "Evangeline." For the *Magazin für die Literatur des Auslandes* he furnished valuable reviews and articles on the literature of Sweden and Spain. He fought, 1864, in Schleswig, and, 1866, at Sadowa, where he was promoted to a lieutenancy. The *Magazin für die Literatur des Auslandes*, of Oct. 8, contains an account from a member of the Sanitary Commission, wherein the writer mentions his meeting, on the chain-bridge between Corny and Novéaut (near Metz), "Dr. M., now professor of political law (Staatsrecht) in Halle, who closed his lectures and entered the army with his students."

In some German bookstore in New York they may, perhaps, have a catalogue of the University of Halle, where the full name could be found.

Yours, respectfully,

E. C. F. Krauss.

Boston, Oct. 22, 1870.

Notes.

LITERARY.

The *American Law Review* has so raised the standard of law periodicals that new ones cannot expect to satisfy easily the profession. The remark is applicable to the *United States Jurist*, for example, which Messrs. W. H. & O. H. Morrison announce that they will publish on January 1, at Washington, as a monthly "devoted to the practical wants of the American bar." It will contain "articles on subjects of professional interest, discussions on law reform, a regular summary of legal intelligence, and reviews of the latest law books;" besides passing notes on Congressional legislation, a digest of decisions in the U. S. Courts, abstracts of changes made by acts of Congress, noteworthy decisions of State courts, leading English cases, etc., etc. Mr. James Schouler, author of a recent treatise on "Domestic Relations," is to be the editor. The first volume will be rendered attractive by a series of familiar letters on the "Lawyers of American History" from the pen of an experienced writer. In what way the subject will be treated is not stated, but a good many volumes might without difficulty be filled exclusively with sketches, more or less complete, of men who have stepped from the bar into politics and official position.——Mr. Henry Brooks Adams, it is understood, is to assume the editorship of the *North American Review* with the January number, the publishers being, as heretofore, Messrs. Fields, Osgood & Co. Mr. Adams has been appointed to the new chair of history at Harvard, so that the University does not lose its immediate connection with the *Review*, while the *Review* will gain not a little, we may expect, from Mr. Adams's past attention to politics, and in general from those qualities which the descendants of John Adams have inherited in a marked degree, making them valuable allies and very uncomfortable adversaries.

—A glance at the contents of Mr. Edward McPherson's "Hand-book of Politics for 1870"—in reality for 1869 also—recalls attention from the great political changes which are taking place in Europe to those which this country has witnessed in the past two years. We have, to be sure, no month of September to compare with that which will be ever memorable for containing the overthrow of Napoleon III., the fall of the Pope's temporal power, and the recovery of Strasbourg by Germany. Our famous battle-months, perhaps as precious to the human race, were past when the Fortieth Congress opened its third session in December, 1868, and listened to the last annual message of President Johnson. Mr. McPherson's manual begins with naming the members of the Cabinet and then of Congress at the time mentioned—and it seems long since Mr. Seward was Secretary of State and Mr. Evarts Attorney-General, there have been so many Cabinet changes meantime! Then we have the action of Congress in burying repudiation and passing the Fifteenth Amendment; the members of Grant's Cabinet and of the Forty-first Congress; Grant's inaugural address, message on reconstruction, and various proclamations; then the progress and end of reconstruction; the votes by yeas and nays of State Legislatures on the Amendment; statistics of the Presidential election and of several State elections in 1869. The financial record embraces the measures proposed and adopted by Congress to increase the currency and fund the national debt, and to reform the revenue and revise the tariff, together with those declaratory resolutions which from time to time were deemed necessary, touching repudiation and inflation and the tariff, and other minor questions of policy. The judicial record contains decisions of the Supreme Court on some of the most important issues, also very diverse, that can arise in any country. Such were those in regard to the Legal Tender Act, the McCardle case, the right of colored men to hold office in Georgia, intermarriage of blacks and whites in the same State, the validity of contracts in Confederate money; the right of States to tax United States certificates of indebtedness and notes and United States National Banks, and the right of the United States to tax State banks; the validity of coin contracts, etc., etc. There is also a very valuable list of land subsidies from 1827 to 1870, and statement of the amount of public land still left to be given away or plundered; the national debt statements; the fortunes of female suffrage in Congress and Massachusetts; the new constitution of Illinois; and other documents of permanent interest, down to July of the present year. We cannot too much praise the industry and intelligence of the compiler, whose services, it should not be forgotten, are not rendered to one party at the expense of the other, but impartially to the whole people.

—It is rather late to notice a little guide-book published by the Messrs. Appleton, called "Skeleton Tours through England, Scotland, Ireland, Wales, Denmark, Norway, Sweden, Russia, Poland, and Spain," of which Mr. Henry Winthrop Sargent is the editor. The design is a novel one, and is so well expressed by the remainder of the title that we give it here: "with various ways of getting from place to place, the time occupied, and the cost of each journey to a party of four; with some of the principal things to see, especially country-houses." No better basis for a guide-book can be had than carefully-kept notes of actual travel, and these are what Mr. Sargent seems to have used, with good results. The attempt to compete with Murray or Baedeker in the grand tours would, of course, have been out of the question; but the editor having had the taste and good fortune in journeying to leave the beaten tracks, he has opened up fresh regions even for those who have "done" Europe till sated. This is especially true of England, where he and his party carried out a plan of visiting all the country places worth seeing, large or small, all the cathedrals, the university and school towns, and the various watering-places and spas. We do not doubt that, as Mr. Sargent pretends, any one who follows the same course will see and know more of England than most Englishmen. The expenses, it ought to be stated, which are here reckoned, are lower *pro rata* than they would be for a single person travelling in the same way, by first-class conveyances and with every comfort of food and lodging, but still amount to from eight to ten dollars a day. The English tour, however, is precisely adapted to pedestrianism—in everything except the light in which a pedestrian is commonly regarded by English country people, to whom "the tramp" is apt to be the pedestrian type; and we trust that some who enjoy walking for its own sake, as well as those to whom it is a necessary economy, may be able to express their obligations to Mr. Sargent for directing their steps. For the sake of Americans who believe in knowing something of their own country before going abroad, as well as of foreigners who come over here, we may as well mention in this place "Appleton's Hand-book of American Travel," of which we have before us in a neat volume the Northern and Eastern Tour—from Canada to the Maryland line. One must not consult it for out-of-the-way places without being prepared for occasional disappointment; but it is nevertheless full, if not complete, and has evidently been carefully revised. For this reason, we call the editor's attention to two slight errors which we have observed in passing—the statue of Everett in the Boston Public Garden was not made by Powers, but by Story; and Bashbish Falls are not in Connecticut, as the index, apparently misled by Mr. Beecher, states, but belong either to New York or to Massachusetts, being nearly on the border line.

—While speaking of-guide-books, we must not overlook Robert von Schlagintweit's brochure on the Pacific Railroad—"Die Pacific-Eisenbahn in Nordamerika" (New York; L. W. Schmidt). The author had the privilege of passing over the entire line on the day following the opening, and again subsequently, and having taken some pains to gather trustworthy statistics of the great enterprise, used them for a series of sketches in a German periodical. These he now by request republishes in their present form. The book, notwithstanding Herr Schlagintweit's scientific predilections, is a strictly practical one, and he half apologizes for mentioning that between Omaha and Platte City he took plaster casts of the heads of four Indian males and five squaws. But the story of how the road was built, and what one sees by the way, is anything but drily written, and an American especially will read with satisfaction the author's praise of American good-nature at railway-stations, of the absence of haste and worry in the depot at Omaha (so different, he says, from one's experience on German roads), the punctual start (wonderful!); the generous allowance in regard to baggage, the system of checks, the construction of the cars. He does not fail to note that these grow more comfortable the further West one gets; and in describing the Pullman sleeping-cars he does not omit the spittoons nor the colored attendant; and puts both the bell and the cow-catcher into his picture of the much-praised locomotive. The wood-cuts, by the way, are all from photographs, and give a fair idea of some of the chief features of the road and the country. There are numerous tables; showing the equivalence of English and German miles—as that 9 of the former equal nearly 2 of the latter, 60 nearly 13, 300 nearly 65, and 3,200 exactly 694; also the fares from all parts of the United States to San Francisco; the rate at which the two roads were built; the cost of freight; the stations and number of miles (both English and German) from New York to Omaha, and the same data, with elevation added, for the remainder of the route. At the end is a serviceable map of the road, with stations marked from Chicago to San Francisco. We do not know of any work in English that contains more information, more agreeably told, on the same subject.

—In explaining why we in this country cannot produce a comic paper, no hypothesis wears better (or, to borrow a slang phrase, "washes" better) than that our national humor is so diffused as to seek and to have a thousand channels for its expression, and that what thus becomes our daily food, as it were, in all our newspapers, cannot be served up as a delicacy in any one. This view is certainly supported by the number and diversity of our more prominent humorists; and it is worth observing that, with Artemus Ward only lately deceased, we should have as contemporaries Mark Twain, Nasby, Josh Billings, Bret Harte, Orpheus C. Kerr, and the irreverent and matchlessly impudent Town-Crier of the *News-Letter*, all writing actively, and each entirely distinct from the others—which may be said even of the three California humorists here mentioned. For sustained humor, independent of cacography, Mark Twain will probably be allowed the place that we have assigned him at random in the enumeration; and he is quite the antipodes of Josh Billings, who indulges in no prolonged efforts, who does have "bad spells," as he says, and whose humor finds vent in short aphorisms on all phases of human experience and conduct. His "Farmer's Allminax" last year was immensely successful, and that for 1870 is even better. Our English cousins have, we believe, taken kindly to Billings (whose real name, by the way, is Shaw), and we can recommend them to count his "Allminaxes" among their regular aids to digestion. To be sure, he is humorous on rather a low level, but he is seldom guilty of a *double entendre*, and often writes in what would be high style if expressed grammatically. His attentions to the mule are as persistent as they are droll, and almost constitute a distinguishing feature. Thus, in his "Housekeeper's Guide," he says: "To find the solid contents ov a mule's hind legg, feel ov it clussly;" and of coons: "They want az much waiting on az a blind mule on a tow-path." And this might almost be offered as an addition to Christian evidences: "The man who wont beleave enny thing he kant see, aint so wize az a mule, for they will kick at a thing in the dark."

—The one figure in the French kaleidoscope whose change of position since the beginning of the summer has moved nobody to pity, is Émile Ollivier. He came into office inspiring the highest hopes in the friends of constitutional liberty, and seemed to hold in his hand the destiny of personal government. He kept his place long enough to develop the weakness of an easily flattered vanity, to make inexcusable and fatal mistakes of policy, to serve as the despised instrument of the Opposition, to share in bringing on his country the most humiliating war in all her history, and then fell, carrying with him the sympathy of no party and scarcely of any individual, and has passed into the obscurity of virtual exile, disregarded when not remembered with bitter reproaches. It is now stated on his behalf that he went to Italy to engage the Government to interfere to save France from her self-invoked fate, when his brother chanced to fall sick at Turin, and required his attentions. While thus occupied he heard of the proclamation of the Republic, which determined him not to return to France. He accordingly retired, upon his brother's recovery, to Pollone, near Biella, and there, as the guest of the Deputy Valerio, he is preparing a work in two volumes entitled "Mon Ministère du 2 Janvier." Volume one will discuss "le plébiscite;" volume two, "la guerre." As might have been supposed, Ollivier will undertake to prove that the war was provoked neither by France nor by Napoleon III., but by Prussia. That will be good reading after the capitulation of Paris, and about as instructive as Alexander H. Stephens's "Constitutional View of the Late War between the States."

—On the 1st of October an eminent Italian author, Luigi Cibrario, passed away both from political and from literary life. He was of humble origin, but died a senator, count, knight, minister of state, and fellow of the first academies in the world. He was born in Turin in 1802, became a doctor of laws at the age of twenty-two, and already had signalized his talent by several historical monographs when, in 1839, he acquired a European reputation by his "Political Economy in the Middle Ages," which ran through several Italian editions, and was translated into French and German. In 1840 appeared his "History of the Monarchy of Savoy," by which he is best known, and which was followed by a work on "Artillery from 1300 to 1700." In the midst of these graver studies, he found time, with extraordinary but truly Italian versatility, to write poetry and novels, and edited Petrarch's *Rime*. His history had won for him the attachment of Charles Albert, whose liberal innovations he discussed in a brochure entitled "Pensieri sulle Riforme di Carlo Alberto" in 1847. He assisted in the campaign which ended with Novara, and was deputed to visit the king at Oporto, after his abdication, in order to persuade him to return to Italy. This suggested the narrative known as "Ricordi di una missione in Portogallo." The work which engaged his waning strength was worthy of his learning: "On Slavery and Serfdom" ("Della schiavitù e del servaggio").

—Under the signature of "Cantoniensis," a writer holding, we understand, an official position under the British Government, furnished the late *Notes and Queries on China and Japan* with some curious details of the Chinaman's domestic expenses, which are worth reproducing for the bearing they have on the problem of Chinese labor in this country. It may be well to state as a preliminary that three monetary denominations exist in China: the *tael*, or ounce of silver, worth at par \$1 33⅓; the Mexican dollar (our U. S. dollars are rejected as containing too much alloy); and the *tsien*, or "cash," of which nominally 1,000, but usually from 1,200 to 1,500, constitute the dollar. This infinitesimal coinage has obvious advantages in the facility it affords for the purchase of goods in small quantities. Its queer-looking appearance is familiar to most people, the thin casting being perforated by a square hole in the centre, through which strings of native grass or bamboo filaments are rove for convenience of carriage. The prevailing material is slightly alloyed copper; but iron, brass, and even clay, the two former pure, and the latter in combination with iron, have at times been used to serve as mediums of exchange. It having been stated that a Chinese beggar can sustain life on 30 *cash*, or but little over two cents, per diem, "Cantoniensis" admits that life can be, and frequently is, sustained for a considerable time on even a less sum by the wretched beings who form the pariah class of the Chinese population. He prefers, however, to place the average somewhat higher—say 90 cents per month for food and lodging—if lodging, indeed, it can be called. And this he estimates as the lowest sum upon which existence can be indefinitely prolonged. Ascending to the ordinary laborer, or "coolie" as we denominate him, food alone is estimated at from \$1 20 to \$2 per month. On the latter sum he would live sumptuously, and above the average style of his class. Upon one *tael* per month he would have a sufficiency of rice, fish, and vegetables; pork (the common meat of the poorer classes) once a day, and some of those little extras in the way of sauces, oils, etc., in which the Chinese palate especially delights. Upon one dollar per month he might for a time exist in a condition fit to labor, but would probably succumb before long to cutaneous or other diseases especially resulting from poorness of diet, combined with exposure and hard work. Amongst the better classes who are enabled to live comfortably, but without display, "Cantoniensis" estimates the monthly expense for food to each individual at \$4 per month. These number in their ranks the lowest grade of officials, writers, and copyists in the public offices, doctors, etc.

—In the matter of rent, the Chinese enjoy superior advantages; for in no country in the world can a man live so cheaply in proportion to his means and position. If the laborer be married, he will probably share equally a house, having three rooms, with another similarly situated, at a total rental of \$2 per month. The cheapest domiciles for a single couple run as low as 840 *cash*, or about 70 cents, per month; and even these are, in many cases, shared by two or more families whose poverty compels them to put up with such straitened quarters. The remarkably pliable and contented disposition of the Chinese is herein strikingly exhibited, the utmost concord usually existing between the partners in these limited establishments. But then drunken husbands are almost unknown amongst our "debased" fellow-creatures on the other side of the Pacific. The class above alluded to as expending an average of \$4 a head per month for provisions, would generally occupy a house renting at from \$72 to \$96 per annum. Attendance is, of course, an item which falls only upon the well-to-do classes. The average rate of wages is from 60 cents to \$1 40 a month, in addition to food. Three servants form the ordinary establishment of a married man with children; and in this case two dollars per month is supposed to cover the expense of each. Sometimes, however, they are found in clothes, especially when engaged by mandarins. The total expenses of a Chinese laborer for self and wife may therefore be fixed at \$2 80 for food and \$1 for rent, making a monthly disbursement of \$3 80, irrespective of clothes. The lowest sum on which they could live and labor would be \$2 35 for food and rent. It is impossible to particularize the various grades between the common laborer and the lower "better class." But the expenses of the latter—say a man, wife, and three children—may be put at \$30 per month, thus divided: Rent, \$8; food for three servants, \$3; do. for parents, \$8; do. for three children, \$8; wages of servants, \$3; total, \$30. Cheap as are the prime necessaries of life in China, the silly stories of Chinese want of nicety in devouring offal and garbage are devoid of foundation as they are ill-natured, none but the lowest beggars eating anything which would offend the fastidious palates of "Hans" or "Patrick." In the matter of clothes, the Southern Chinaman is greatly favored by the climate, which permits him to dispense with any but the lightest upper garments. In the agricultural districts even the cotton jacket is seldom worn, the field laborers being naked from the waist. The average expenditure of a native in the rural districts does not amount to much over $6 or $7 per annum. With the richer classes, the scale of expenditure varies precisely as it varies here. Nothing is more untrue than the assertion, so frequently made, that Chinese fashions are unchangeable. The cut of his coat is as important in the eyes of a Chinese dandy as in those of his brother swell on Broadway; and it generally happens that Chinese clothing is, owing to the materials used by the "respectables"—silk in summer and valuable furs in winter—more expensive than the broadcloth and tweeds in which we choose to encase ourselves. Upon the whole, living in China appears to be cheap for the Chinese. That they find no difficulty in living cheaply when removed to other countries, we know very well. It remains to be seen what effect upon their tastes their surroundings here will produce, and how much tradition and custom will shield them from the temptation to eat, dress, and lodge like native Americans.

THE PROPOSED REVISION OF THE ENGLISH BIBLE.

III.

THE PLAN PROPOSED.

THE revision of 1611, usually styled the "authorized" or "standard" translation of the Bible, because it was executed and "appointed to be read in churches," by royal authority, has been generally accepted by English-speaking Protestants as both an eminently beautiful and, in the main, a sufficiently accurate version of the sacred Scriptures. It has, nevertheless, been much criticised, and numerous attempts have been made, sometimes by dissenting sects, sometimes by individuals both in and out of the English Church, to correct its alleged errors, to improve its diction, or to supplant it by an entirely new translation. These experiments, though frequently begun under imposing auspices and conducted with much labor and learning, have met with but indifferent success, and we believe that no English Protestant denomination now habitually reads the Bible in any other text than in that of the Version of 1611.

The necessity of a new authoritative recension of the English Bible has been much discussed in the Anglican Church, and measures have at length been taken, by a branch of that organization, for carrying into effect a proposal so often made and so often rejected in the ecclesiastical councils of the State Church of England. On the 10th of February, 1870, Dr. Wilberforce, Bishop of Winchester, submitted to the Upper House of the Convocation of the Province of Canterbury a resolution providing for the appointment of a "joint committee of both Houses, with power to confer with any committee that might be appointed by the Convocation of the Northern Province, to report upon the desirableness of a revision of the Authorized Version of the *New Testament*, whether by marginal note or otherwise, in all those passages where plain and clear errors, whether in the Greek text originally adopted by the translators, or in the translation made from the same, shall, on due investigation, be found to exist." The resolution was favorably entertained, but, to use the words of Blunt,* "in the course of half an hour it underwent a gigantic transformation, by being made to comprehend the *Old Testament* and the Hebrew text also." Seven bishops of the Upper House and fourteen members of the Lower were appointed on this committee.

The committee, for reasons not stated by Blunt, "met with no co-operation from the Convocation of York," but on the 11th of May, 1870, it submitted a report, recommending a revision of the Authorized Version, "comprising both marginal renderings and such emendations as it may be found necessary to insert in the text of that version." The third article of the report was thus worded: "That, in the above resolutions, we do not contemplate any new translation of the Bible, or any alteration of the language, except where, in the judgment of the most competent scholars, such change is necessary;" the fourth, "That in such necessary changes, the style of the language employed in the existing version be closely followed;" the fifth, "That it is desirable that Convocation should nominate a body of its own members to undertake the work of revision, who shall be at liberty to invite the co-operation of any eminent for scholarship, to whatever nation or religious body they may belong."

The report was accepted by the Convocation, though not without opposition in the Lower House, and a joint committee of sixteen persons was appointed "to consider a scheme of revision on the principles laid down," and "to invite the co-operation of those whom they may judge fit, from their Biblical scholarship, to aid them in their work."

On the 25th of May, 1870, the committee adopted ten resolutions, the first seven dividing the members into "two companies, the one for the revision of the Authorized Version of the Old Testament, the other for the revision of the Authorized Version of the New Testament," nominating the members of the two companies, and advising that several "scholars and divines," indicated by name, but not belonging to Convocation, though all, we believe, Englishmen, and nearly all clergymen of the Established Church, "be invited to join" the respective companies. The eighth resolution lays down the general principles to be followed by both companies, among which are:

"1. To introduce as few alterations as possible into the text of the Authorized Version consistently with faithfulness.

"2. To limit, as far as possible, the expression of such alterations to the language of the authorized and earlier English versions.

"3. Each company to go twice over the portion to be revised, once provisionally, the second time finally.

"4. That the text to be adopted be that for which the evidence is decidedly preponderating.

"5. To make no changes in the text, except two-thirds of those present approve the same.

"6. To refer, on the part of each company, when considered desirable, to divines, scholars, and literary men, whether at home or abroad, for their opinions."

The remainder of the resolutions refer only to the mode of proceeding and form of the revision, and are of no special interest, except as indicated hereafter.

The report and resolutions of the committee were adopted by Convocation, and it is understood that the two companies of revisors have begun their labors.

The proceedings of the Convocation excited a good deal of interest in England, and, on the 14th of June, Mr. Buxton moved, in the House of Commons, "that an humble address be presented to her Majesty, praying that she would be graciously pleased to invite the President of the United States to concur with her Majesty in appointing commissioners to revise the Authorized Version of the Bible." This motion was supported by Mr. Buxton in a very able speech, and a debate followed, in the course of which Mr. Gladstone, in the name of the Ministry, opposed the motion, chiefly on the ground that it was inexpedient, or at least premature, for the Government to take any steps in regard to a revision, and that it was better to leave it to the "free agencies of those powers of piety, zeal, and learning" which, as Mr. Gladstone had no doubt, "existed in England in ample sufficiency for the attainment of the end." Many eminent members of Parliament took part in the debate, and, among others, Mr. Beresford Hope, proprietor of the *Saturday Review*, whose speech was distinguished by that minute and intimate knowledge of the American people, their history and their institutions, that candid and generous appreciation of their character and their action, and that conscientious and painstaking regard for exact truth, which are so conspicuous in all this gentleman's writings and discourses on the United States, as well as in most of the articles on American subjects in his *Review*. Mr. Newdegate also enlightened the House on an obscure point of American history by informing the members that, "when Washington desired to establish a church in the United States, he was prevented by Jefferson, behind whom was Carroll, the brother of the first Jesuit who was made a bishop, and in the Jesuits' history that achievement was boasted of as one of the successes of their order."

In consequence of the opposition of the Ministry, Mr. Buxton withdrew his motion, and the sole responsibility of the undertaking now rests with the Convocation of the Archbishopric of Canterbury.

Two objections suggest themselves at once upon a view of this plan. The first is that it is a purely sectarian, not to say schismatic, movement, and, as such, calculated to widen rather than to narrow the divisions which exist between the different Protestant churches of the English speech; the other, that it is evidently a half-measure, aiming at no thorough work which shall establish the readings of the original text and of the English Bible on a reasonably satisfactory and permanent basis.

It is remarkable that the scheme recommended by the Committee of Revision is narrower and less liberal than that proposed by the report of the Bishop of Winchester, which is itself again less broad and comprehensive than the resolutions first moved by that prelate in Convocation.

---

* "A Plain Account of the English Bible, from the Earliest Times of its Translation to the Present Day. By John Henry Blunt, M.A., F.S.A." London: Rivingtons. 1870.

The Bishop of Winchester's original resolutions provided specifically for the correction of errors in the English *New* Testament arising from the adoption of a faulty "Greek text" by the translators of 1611, and they were amended in Convocation so as to comprehend the *Old* Testament and "the Hebrew text also." The report of the Bishop of Winchester accepted by Convocation does not refer at all to the Hebrew and Greek texts, but it authorizes the Committee of Revision "to invite the co-operation of any eminent for scholarship, to whatever nation or religious body they may belong." The scheme of the Committee of Revision, in the fourth section of its eighth article, directs that, "when the text adopted differs from that from which the Authorized Version was made, the alteration be indicated in the margin," but otherwise it nowhere alludes to the original texts at all, and, instead of inviting the co-operation of learned foreigners and dissenters, it empowers each of the two companies "to refer, when considered desirable, to divines, scholars, and literary men, whether at home or abroad, for their opinions."

It would be uncandid to deny that some critical revision of the Hebrew and Greek originals is implied in this scheme, but it is evident that such revision—a labor which ought to form the very basis of the whole undertaking, and which requires for its execution the most advanced Oriental and Biblical learning of our times—occupies but a very subordinate place in the minds of the committee, and that when they narrowed down "the co-operation" of eminent scholars, without regard to nationality or religious denomination, to simply asking "the opinions of divines, scholars, and literary men, whether at home or abroad, when considered desirable" by either of the companies, they meant to exclude all such scholars, except the few English divines and laymen whom they invited to join the companies, from any general participation in the work, and from all equality of authority in the decision of questions of reading and interpretation.

But, as an indication of the superficial character of the work proposed by the committee, the third section of the eighth article is the most remarkable and the most important. It is in these words: "Each company to go twice over the portion to be revised, once provisionally, the second time finally, and on principles of voting [by two-thirds] as hereinafter is provided." Upon two readings, then, the recension of the original Hebrew and Greek texts, and the wording of the translation—a translation which, as has often been shown, is the growth of many centuries—are to be definitively settled by a two-thirds vote of such members of the respective companies as may happen to be present when the vote is taken! The proof-sheets of the simplest writing in our own language require much more than "two readings" before an experienced compositor feels any confidence in the accuracy of the typography, and certainly not one of the reverend gentlemen of the committee would allow a sermon of his own to go forth to the world upon such a revision as this. We freely admit that it is probable the committee means by this language more than it expresses, and that, in the way of critical labor, its members will perform more than they promise; but making every allowance which a liberal construction of the articles, and a due respect for the intelligence of the divines who compose the committee, authorize, it is not too much to say that the plan in question manifests, in itself, no just appreciation of the real character and extent of the duties and responsibility involved in the satisfactory performance of the important task the revisers have undertaken.

On the other hand, so far as the rules go, nothing can be sounder or more judicious than the principles laid down by the Committees of Convocation and of Revision in regard to the extent of changes in the standard translation and the diction of those changes. They are these:

1. To introduce as few alterations as possible into the text of the Authorized Version consistently with faithfulness.

2. To limit, as far as possible, the expression of such alterations to the language of the Authorized and earlier English versions. We say these rules are sound, *as far as they go*, but they leave us wholly in the dark on one of the most important points involved in this whole discussion—the question, namely, to what extent they propose to modernize the vocabulary and style of the standard version. The first rule allows as few alterations as possible "consistently with faithfulness." But faithfulness to what? To the original text, or to the idiom of the English language considered as altogether a *living* speech? Will they retain all Wright's hundreds of archaisms, provided they are, or rather once were, true translations, or will they replace obsolete by still current words and phrases, and, if so, by what principles will they be guided in the substitution? On this question—a question which more than any other concerns the taste and intelligence of the ordinary reader, a question upon which, more than upon any other, will depend the quality of attractiveness of form in the new revision as compared with the old—the report of the committee gives us no information whatever.

We spoke of the plan of Convocation as a sectarian, if not a schismatic, movement. It is sectarian, because it was originated and organized, and is to be controlled wholly, by divines of a single sect—the Established Church of England; and it is not uncharitable to ask, whether a proposal to remodel the English form of the authoritative basis of the Christian faith by a fraction of that sect, and upon a plan in which one of the two great ecclesiastical provinces of that church refuses all participation, does not savor of that tendency to schism which the Anglican Church, beyond all others, condemns as evincing an antichristian spirit.

The Bible of 1611 is the common property, and substantially the religious oracle, of sixty or seventy millions of English-speaking Protestants, of whom scarcely a tenth are directly or indirectly represented in the Convocation of the Southern Province of England, or in any manner admit the spiritual or ecclesiastical supremacy of that body. The proceedings of the Convocation do not recognize the remaining fifty or sixty millions—except their recusant brethren of York—as having any acknowledged religious status, or any common interest in the true interpretation of the law to which all Protestants alike appeal.

It would be invidious to discuss the personal fitness or unfitness of individual members of the companies of revision for the labor they have undertaken. Indisputably, there are among them many of England's most learned divines, as well as several gentlemen eminent for a thorough knowledge of the English language; but it will not be pretended, by any unprejudiced person who is acquainted with the sacred learning and literature of the day, that these companies embrace the ablest living Biblicists of Protestant Europe, or that, as Hebraists, Grecists, or Scriptural exegetists, their members have yet given proof of superiority to the foremost class of American scholars in the same departments.

If it is worth while now to undertake a new recension at all—which we by no means admit—the interests of Christian harmony require that the labor be inaugurated under the most catholic auspices, and that the composition of the board of revisers, and the principles upon which the revision is to be conducted, shall furnish every guaranty that the task shall be executed with all possible learning, all possible discretion, all possible fairness, charity, and candor. We find no such guaranties in the plan before us. It does not appear that the revisers propose to avail themselves of the amplest existing instrumentalities, or of the ablest living scholarship, or that they take sufficiently into view the claims, the capacities, and the wants of Protestants educated in theological schools different from their own. We admit—and this expectation is founded on a high appreciation of the general intelligence of the committee, not on satisfactory evidence of their special qualifications or of the soundness of their views in regard to the duties they have assumed—that their labors will result in an English text probably superior in accuracy of interpretation, and possibly even in uniform felicity of expression, to the standard translation. But we see no ground whatever for expecting that this recension will satisfy the reasonable demands of learned criticism, or that it will be a text which any considerable body of Protestants will adopt in place of what they have so long reverenced as an authoritative rendering of the original Scriptures, still less a version which the Christian public of England and America will accept, or ought to accept, as the only substitute which can be justifiably offered for the English Bible of 1611—namely, the best translation which the Biblical learning of the world and our present mastery of our mother tongue are capable of producing.

G. P. M.

PROFESSOR PORTER ON AMERICAN COLLEGES.*

Of all forms of literature, perhaps, there is none more carefully shunned by general readers than so-called educational works. Even when not distinctly and specifically technical, they are apt to be one-sided, are usually dry and limited in treatment, and often puerile. The weary associations of the *shop*, of the dull fagging at grammars and sum-books, is apt to hang about them; and whoever reads them does it as an unwelcome duty, not otherwise. But such a work as this of Professor Porter's claims the interest, or at least the attention, of all cultivated men. Even those who are not warmly interested in popular education as such, who care little or nothing about Pestalozzi and Froebel and Horace Mann, and nurse themselves with the soothing conviction that Tim O'Flaherty, and the other budding Presidents his playmates, will "tumble up" somehow without the necessity of such elaborate educational apparatus as is now lavished upon them—even these will be likely to recognize the supreme importance to the educated classes of the college and the university. That essential differences in these institutions produce specific results among the higher classes of the community cannot be overlooked or denied. In that compound function which we call national character, to the three principal variables, race, climate, and political organization, must be added a fourth—school and university education; and no one who believes that social influences act from above downward can fail to recognize the immense effect in this regard of the college and college systems. It would be a lively illustration of this point to take the three types, the Yale or Harvard "graduate," the Oxford "honor-man," and the Berlin or Heidelberg "doctor," and examine in how far his marked individuality is a product of his peculiar university course, and in what way he in turn reacts upon the community which has trained him. But for the present we are concerned only about the American student and the American college.

---

* "American Colleges and the American Public. By Noah Porter, D.D." New Haven: Chas. C. Chatfield & Co. 1870.

Among the advocates of various educational systems, Dr. Porter occupies what a Frenchman would call the Right Centre, or certainly a very moderate Right. To state his doctrine briefly, he is prepared, in a liberal spirit, but firmly, to *stare constitutis.* He accepts the conventional college system as it existed thirty years ago, as, in its main outlines, the right and the best, and the modifications which he consents to, or in some instances proposes, are corrective, not subversive.

In his first, or historical and introductory chapter, he reviews the efforts made in the last thirty or forty years to give greater scope and elasticity to the prescribed courses in the American colleges, and to open the way to a more liberal study of the so-called practical branches of science and literature. Without formal statement as an argument, considerable emphasis is laid on the fact that these efforts are by no means as new as many suppose, but date as far back as 1825–6, and that they have been experimental and not always satisfactory; that, indeed, to quote from Dr. Wayland, "we have been taught that the public does not always know what it wants, and that it is not always wise to take it at its word." By a candid statement that he does not "regard the college system as faultless," but, on the contrary, believes it "to be capable of some very important modifications and improvements," he clears the way for Chapters II. and III., the "Studies of the American Colleges" and "The Prescribed Curriculum."

In these chapters he plunges at once into the vexed question—perhaps the most important one in College Reform—the great case of Prescribed Studies *vs.* Electives, or, more properly, of Classics and Mathematics *vs.* Modern Languages and Natural Science. Here he takes decided though not bigoted ground. Admitting that an exclusive attention to the studies of the conventional course may be injurious, and should properly be supplemented by a fair quantum of History, Modern Languages, and Elementary Science, material and moral, he vigorously contests the expediency of omitting them, or even of materially diminishing their rank in the course. Assuming that college education is not, and in general should not be, professional and technical, but gymnastic, or, as a German would say, *propædeutic,* he earnestly defends the value of the classics and mathematics as pure training. He lays great stress on the fact that the study of the ancient languages is not, as has been asserted, a mere study of words and practice of memory, but, from their subtle and complicated grammatical structure, a very high and delicate metaphysical training, the most effective, perhaps, at least in connection with mathematics, which the youthful mind is in the average capable of receiving. This gymnastic merit he in great measure denies to the less philosophic structure of the modern languages, but consoles us with Mill's assertion that "the mastery of Latin makes it easier to learn four or five of the Continental languages than it is to learn one of them without it." As good mental furniture, and as a liberalizing and humanizing influence, he makes an eloquent defence of ancient literature, and quotes Goldwin Smith to the effect that, "though the classics are no longer what they were in the sixteenth century, they are still, perhaps, the best manual of humanity, and they are capable of being practically enlarged in their scope, and *liberalized* to an almost indefinite extent in the way of commentary and illustration." Professor Porter's suggestions as to various minor methods of rendering the study of the classics more attractive in character and fruitful in results to average college classes are worth serious attention from practical instructors.

His argument against substituting for these studies that of natural science, though somewhat diffusely stated, may be summed up in this, that a mind untrained by the preparatory work he commends is not in condition to turn to physical science with the requisite vigor, nor with the philosophical breadth and acuteness, of the thoroughly trained student. This argument he further develops in the chapter on elective studies, in which he urges that a too great extension of the elective system leads to onesidedness, overhaste, and superficiality in the choice and method of studies, and condemns the attempt to engraft the purely technical preparation of the professional schools on the more universal curriculum of the undergraduate department. On this point he makes a bold statement, which, however, most friends of the highest culture will probably view with favor—that "the student who begins the study of theology or law in his sophomore or junior year, or pursues a course of reading which has special relation to his future profession, in ninety out of a hundred instances becomes a greatly inferior theologian or lawyer in consequence, and does not appreciably abridge the time required for his professional preparation." Very noteworthy, too, is his reminder that the German *universities* form no standard for the American *college;* that the true counterpart of our college in studies, age of the students, previous preparation, and the like, is rather the German *gymnasium,* which in its whole character is precise and strict, and as far removed as possible from the democratic freedom of choice now sought to be introduced into our own institutions.

It would have been interesting to follow our author from step to step with argument or comment, but he tells his own story so well that we are fain to let him do it for himself. So far, probably, a fair share, perhaps even a majority, of the most discriminating friends of thorough intellectual culture will be inclined to agree with him that the classics and mathematics in reasonable measure and up to a reasonable age are, on the whole, the best average pabulum for the average human mind; that, this being so, it is wise to surround the study of them with certain safeguards of prescription; and that, in postponing the more special professional studies till the period of physical and mental manhood, we are only following the profound common-sense of the French proverb, "reculer pour mieux sauter." We are equally inclined to approve the chapter on college recitations in contrast to examinations and lectures, but could have wished to see more attention given to the objections against the marking system as a distracting weariness to the professor, and more emphasis laid on the necessity of careful classification in the recitations, to avoid the utter demoralization consequent on setting the best scholars, for some hours per day, to listen to the blundering and shirking of the incapables. But we can heartily commend the professor's comments on the duty of self-sacrificing work at actual *teaching* to many aspiring professors *in ovo,* as well as to many actual incumbents, who, like Browning's alderman, with slight alteration,

> "Hope because they're old and obese
> To find in the furry *college* robe ease."

The chapter on the Religious Character of Colleges is one of those thorny tracts which the reviewer would gladly step over as gingerly as possible. Undoubtedly, in all quarters of the country out of sound of the bells of Brattle Street and the Old South, this chapter will find almost universal approval. With many of its arguments and its conclusions we are disposed heartily to go along, but the general question, whether it is wise to attempt to engraft any formal religious instruction, so-called, on the college course, or to imprint any technically religious character on the college as a body or a system, seems to us still open, spite of the Professor's well-meant efforts to set it at rest. In view of his avowed liberality and aversion to sectarianism, it might be pertinent to remind him that what he stigmatizes with the name of "irreligion," "atheism," and the like—the doctrines of men like Emerson and Parker or Longfellow—might, by a not very forced construction, be considered to form a sect or sects of religious belief at large, though not perhaps of the Christianity which Professor Porter believes to include all religious possibility. In view, too, of the wide and almost preponderating influence of transcendental doctrines among the cultivated classes of New England, the Professor, according to his own theory of allowing any important sect a university or college organ, could hardly grumble if Harvard College came to represent even more distinctly than at present the extreme left of these tendencies.

It is to the credit of the Professor's heart and temper that, in the chapters on Internal College Discipline, the Dormitory System, etc., he warmly defends the social intramural life of the students as a necessity to the full enjoyment of all the advantages of university residence. In this chapter, as in all the others, let us say, once for all, his suggestions of useful modifications in the college government, the appointment of fellows, the intercourse between officers and students, and, in short, all the practical minutiæ of college life, are extremely valuable. Nor are his hints less worthy of attention when he treats of broader matters, and throws out propositions as to the establishment of professional and scientific schools, and the enlightening and modifying, though not subverting, of the conventional systems hitherto existent. It is with regret that, in deference to the limits of time and space, we drop the consideration of this very able, earnest, scholarly, and, in almost all points, liberal treatise. We cannot refrain from quoting, as the key-note of the whole, a few of its last words:

> "As long as study is valued for the money or position it procures, and the theory of disciplinary study and of liberal culture is openly scouted in the forum and the market-place and attacked in the newspaper and the review, so long will the true university be unknown among us. It is in the name and interest of true progress and of real reform that we protest against the supercilious and positive spirit in which the professed guides of the people—some of them graduates of colleges—have treated the aims and objects of education, as well as the contemptuous and ignorant appeals to the prejudices and ignorance of their readers which many have allowed themselves to employ."

Robert Falconer. A Novel, by George Macdonald, author of "David Elginbrod," "Alec Forbes of Howglen," etc. (Boston: Loring. 1870.)—Unless our memory serves us ill, the hero of this novel was first presented to Mr. Macdonald's readers in his last year's story of "David Elginbrod," where he figured toward the close of the book in the character of an amateur detective, possessed of a sort of Scotch second-sight, which stood him in good stead when he had on hand the business of discovering and restoring to her friends a young lady who had been spirited away by a villain who had thrown her into a magnetic slumber. That he was a remarkable person, whose history was well worthy to be recorded, even by his present biographer, we were assured even then—and it is, of course, a by no means bad story in which he now appears. Mr. Macdonald is always readable, both for what he says and for his way of saying it, although, for our part, we have never succeeded in liking him so well as in "Alec Forbes," in which we first made his acquaintance. In the present story, Robert Falconer appears as a boy of fourteen, a half-orphan, living with a Calvinistically-religious and severely-kind grandmother, and with a disreputable father, whom he has never seen but once and never hears mentioned, roaming somewhere about the world. It was to be expected that Robert's grandmother should occupy a very prominent part in this history. What would become of Mr. Macdonald, or, indeed, of many another writer of Scotch novels, if he could not draw us a character crushed or else drawn awry between the natural religious sentiment which inspires a belief in the benignity of God and the Calvinistic theory which contemplates his justice only? It is a sort of retribution, we suppose, which provides that what miserably edified the last generation should drearily amuse the present.

Robert is brought up by his grandmother after the straitest Calvinistic fashion; deprived of all amusement, made to study hard and to pray aloud in a corner of the parlor, not allowed to solace himself with music, for which he has a passion, and even doomed to see his grandfather's violin, a genuine Stradivarius, which he had found, and on which he had secretly learned to play, laid on the kitchen fire as a burnt-offering to the supposed divine decree against pleasure. Nevertheless, being a boy unusually large-hearted as well as large-brained (or else, the reader is told, he would not have been Mr. Macdonald's hero), and being informed, likewise, with a true Scotch sense of duty much akin to his grandmother's own, he sees under all this apparent harshness the real kindness and profound love with which she regards him—a love held in check, it is true, by the doubt whether he is foreordinate unto salvation, but for that very reason all the more painfully sincere. He grows up, therefore, with undiminished respect and affection for his grandmother, but with growing doubts as to whether she has a true conception of God. Presently he falls in love with a woman several years his senior, who is herself in love with his dearest friend. Having an opportunity to go abroad, he tries to dissipate his grief by travel, and at the same time to provide himself with a theory of the universe which shall not only satisfy his theological doubts, but at the same time furnish him with a satisfactory answer to the questions of why he should suffer and how he shall best provide for his immediate future. Such a theory he works out for himself in the course of his meditations on the four Gospels; what it is, Mr. Macdonald states in a number of propositions which we do not quote; the practical result being that his hero betakes himself to a life of philanthropy—having first been furnished by a relative with the means of living without a profession. As the particular object of his life, he proposes to himself the discovery and reformation of his father, and in the pursuit of this filial end becomes a familiar and affectionately respected acquaintance of all the poor and vicious people in London.

What particular end Mr. Macdonald proposed to himself in the creation of such a character as his hero, we find it difficult to conjecture. Beyond the story of his life, which is more interesting than probable, he seems to be intended to point a moral which we do not find it easy to draw. If it be, as we suspect, that Mr. Macdonald feels sceptical of accomplishing any really good work except by individual effort, and regards all organizations for effecting moral purposes as mere appendages to the individual which he does well to shake off as soon as possible, he seems to us to be elaborating in his own mind and suggesting in his novel a fallacy which a consideration of his own methods with his hero might perhaps show him. Undoubtedly, as he says, "God will take care of the man" when he undertakes God's work—but before he can undertake it on this wise even Mr. Macdonald has to provide him with an exceptional character, exceptional training, send him a disappointment in love, condemn him to a single life, and last, but by no means least, endow him with a fortune before starting him on his solitary philanthropic pilgrimage. His heroine, too, who, after her lover's death, betakes herself also to works of charity, and whose co-operation is almost the only one that Falconer will accept, has likewise to be rich and have a house of her own, where fallen women and stray babies may be taken in without the painful restraints of rules and regulations. Is it that an effectual call to good works may be known by its being accompanied by private means and perfect freedom from private duties? Mr. Macdonald would, doubtless, not say yes to such a question, but if he has any purpose at all it seems to be the preaching of individualism as opposed to combination; and that, in matters of charity at least, besides doing greatly less good to the innumerable objects of it, is likely also to ruin the charitable themselves, by inducing such spiritual pride as in the case of Falconer himself.

Still, apart from any consideration of the ideas suggested by the book—considerations which it is not so easy to set aside as it would be if Mr. Macdonald were less of a born preacher than he is, his story is readable and interesting.

The Lifted and Subsided Rocks of America. With their Influences on the Oceanic, Atmospheric, and Land Currents, and the Distribution of Races. By George Catlin. (London: Trübner & Co.)—Mr. Catlin's narrative of what he has seen in traversing North and South America and among the Antilles is, as usual, interesting to read, albeit his theories are little likely to attract the attention of the scientific world. That the Gulf of Mexico and Caribbean Sea have been the scene of vast volcanic disturbances, and that Central America and the West Indies have undergone one or more submersions, is, to be sure, no speculation, but a fact for which there is abundance of testimony. Whether the two continents were ever continuously united, as Mr. Catlin thinks, or whether the cataclysm to which we owe the ruins of Uxmal and Palenque gave rise to the Gulf Stream, is yet to be established. The origin, or any modification, of this heated current evidently holds an important relation to the climatic changes that have taken place on both sides of the Atlantic along its course, and is worth ascertaining if possible. The destruction caused by nature's cataclysm naturally leads our author to compare it with the subsequent destruction of the aborigines caused by the European settlement of this continent. From the fate of the Indians in this country—always a source of melancholy and shameful reflections to the American people—he passes in an appendix to his personal griefs, more particularly to the injurious slanders committed to print by the late Mr. Schoolcraft, and embalmed in the libraries of the world, under the sanction of the United States Government. Mr. Schoolcraft's defects as an Indian historiographer are now, however, so well understood that it seems at first a little unnecessary in Mr. Catlin to seek to protect himself against attacks from that source. Something, nevertheless, must be allowed to the sensitiveness of a man who in other ways has seen his labors dishonored by his countrymen; and we are quite sure that Congress might properly order the number of copies of "O-kee-pa" which Mr. Catlin wishes to have distributed as an antidote to Schoolcraft, and still more properly redeem that invaluable collection of Indian portraits and relics which is now in pawn to Mr. Catlin's necessities.

The Nation.

NEW YORK, THURSDAY, NOVEMBER 3, 1870.

The Week.

THE great event of the week is the surrender of Metz and the entire army of Bazaine, which took place on the 27th of October. This is another Sedan and another Strasbourg in one, if we take Napoleon for no more than he was worth on the 1st of September. The figures of the captures, unparalleled in all history, are perfectly stupendous: three marshals, three corps commanders, forty division generals, a hundred brigadier-generals, sixty-seven infantry regiments, thirty-six cavalry regiments, thirty-one battalions of chasseurs and depot troops, one hundred and fifteen field-batteries, seventeen batteries of mitrailleuses, and thousands of position guns. The total number of sound prisoners is stated to be 140,000, all that is left of the 230,000 commanded by Bazaine on the 14th of August, when he began his disastrous retreat from the right bank of the Moselle. The battle of that day, those of Mars-la-Tour and Gravelotte, a number of sorties, and diseases—the consequence of scanty food—destroyed or disabled the other 90,000. Whether the ravages of disease and the scarcity of food within the walls and camps were so terrible as the first somewhat sensational reports received depict them, and actually rendered a longer resistance impossible, will soon be revealed. The French, in their first burst of grief and shame, have no hesitation in branding Marshal Bazaine's capitulation as an act of treason; and their histories, even in calmer moments, may continue thus to stigmatize it. Impartial observers will at least severely condemn the strategy—whether it was Bazaine's or Napoleon's—which made it possible to the victors to stop in its retreat, to beat and force back, to isolate and imprison, so vast an army in its own country. The Prussians themselves will justly inscribe this unexampled achievement, executed with a strategical precision and a staunch perseverance the merits of which no French blunders can diminish, among the greatest marvels of military history.

How little, however, the Prussians are inclined to rest on their laurels, and slacken their operations, is shown by the fact of one of the corps of their army before Metz receiving orders to break camp even before the capitulation was finally concluded. The two hundred thousand of that army will now spread in every direction, reducing the neighboring fortresses—of which Longwy and Mézières are first to be besieged—preventing the formation, announced by General Bourbaki, of an army in the North, strengthening the besieging camps around Paris, and chiefly increasing the forces operating on the Loire and against Lyons. That all further resistance, in the field, by compact French bodies, is henceforward impossible, is now evident to everybody, and King William has accordingly begun to distribute the highest rewards of victory. General von Moltke, the great planner of the campaign, who on the day preceding the surrender of Bazaine completed his seventieth year, has been created a count, and the Princes "Fritz" and Frederic Charles, of whom the former commanded before Sedan and the latter reduced Metz, have each received a field-marshal's baton. In the same pleasant mood the King has ordered General von Falkenstein to remove all obstacles, imposed by the state of siege, in the way of free voting in the pending elections for the national assemblies of North Germany, to allow public political meetings, and to release all persons arrested for violating the former restrictive regulations. We also hear that Prussia has promised Denmark to fulfil the so long disregarded stipulation of the Treaty of Prague in regard to the restitution of North Schleswig, and has announced to the Government at Madrid her readiness to acknowledge Amadeus of Aosta, if elected, as King of Spain, unmindful of the Hohenzollern candidature. On the other hand, we hear that the negotiations for the final settlement of the general affairs of Germany are soon to be crowned by the unanimous proclamation, north and south of the Main, of William of Prussia as Emperor of Germany. This will probably not take place before Paris opens her gates. She was summoned to do this on the fall of Metz, and the refusal, if persisted in, is to be followed by a bombardment, for which all the preparations are said to have been completed. The city is beginning seriously to feel the hardships of the siege, but as late as Oct. 28 Trochu continued to make warlike demonstrations, a sortie on that day driving back the German outposts at Le Bourget, east of St. Denis. The French fortified the position thus gained, which was, however, retaken by the besiegers on the 30th, after a hot but decisive fight.

Whether the news of the surrender of Bazaine will ultimately have the effect of making the Parisians, both people and Government, inclined to yield to the dictates of common sense, at the last sacrifice ot national pride and vanity, can as yet only be guessed at; for the doings in the besieged capital are now more than ever wrapt in impenetrable obscurity. The first impression produced by the announcement of the catastrophe at Tours and in the regions not immediately threatened by the armies of invasion, seems to have been one of patriotic rage, and loud vent is given in proclamations, resolutions, and addresses to the determination to die rather than submit to the terms of the conqueror. The proclamation issued by Crémieux, Glais-Bizoin, and Gambetta, though calling upon the French nation "to rise above misfortune," has the merit of announcing almost the full extent of the disaster, and, among others, the saddest of truths, namely, that the corrupting power of Imperialism, to which France submitted for twenty years, "extinguished in her the springs of greatness and of life." From "the extremity of misfortune" they expect the renovation of the nation's "political and social morality and manhood"—and they expect it now, forgetting, or feigning to forget, that the history of the two months that have elapsed since the day of Sedan does not warrant even the faintest belief in the possibility now of a national revival so sudden and so powerful as to save the honor and integrity of the country. While Tours resounds with patriotic oaths and exhortations, the French camps in its vicinity offer a disheartening spectacle of weakness, both material and moral, and in no part of France is any display of energy visible corresponding to "the fearful height of the perils" which have broken upon her. Besides some slight successful skirmishes reported from the neighborhoods of Amiens and Chartres, we hear only of one considerable French success, said to have been achieved between Besançon and Montbéliard—and this decidedly lacks confirmation, the report coming from Switzerland, and the capture of Dijon by the Prussians, on Sunday last, proving that the advance of the latter on Lyons is unchecked, and takes place through the valley of the Saône, and not through that of the Doubs, which the Basle news seems to imply. Garibaldi is with a very small force in Dôle, on the last-named river, and, as stated by a *Tribune* correspondent, rather low in spirits. The French army facing the Prussian forces south of Orléans seems to be shifting its position from the vicinity of Salbris, between that city and Bourges, to the left, towards Blois and Vendôme, with the object of covering Tours. A considerable concentration of Gardes Mobiles is taking place in Maine and Brittany.

What is the object of holding Paris, now that Metz has fallen, and that all hope of raising the siege by assistance from any army outside has absolutely vanished, it would be hard to say. "The Army of the Loire" is, of course, as we have often said, a shadowy and half-organized body, which a division of Prussians is sufficient to scatter. The formation of anything worthy of the name of an army in any part of France has, indeed, become impossible in the presence of the large force which the Germans now have disposable. The pretence which the Provisional Government is keeping up of being able to accomplish anything more in the field against the invaders is simply—to speak plainly—a piece of cowardly imposition on a credulous and excitable people. What they can accomplish, and what they are fast accomplishing by their irregular levies and bombastic proclamations and "Francs-tireurs," is the total destruction of French industry and the dissolution of the social bonds among a people singularly dependent on the administrative machine for the preservation of order. The calling in of Garibaldi, after his incapacity against good regular troops had been demonstrated both in the campaign of 1859 and his raid on Rome, is a melancholy evidence of the broken-down condition of the French morale. General Trochu, indeed, in his famous book, cites Garibaldi as an illustration of the worthlessness of irregular troops in great modern wars, and Gouvion St. Cyr gives an awful account, in which Napier heartily concurs with him, of the influence of guerillas in Spain in producing complete social disorganization and filling the country with robbers. Thousands, we may be sure, who begin as Francs-tireurs in France, will soon become common brigands, and very few there will be of them but will, if the struggle last long, return to a peaceful life after having suffered irreparable injury, both moral and mental.

We do not venture to predict that Paris will fall within the present month, but it is difficult to see what is to prevent it. The most sanguine and boastful of the French chiefs has never pretended that it was provisioned for more than two months, and it has now been six weeks cut off from communication with the outer world. It is pretty certain that the army and people are both on short rations—and short rations, of course, mean severe suffering to the large body of delicate persons which must exist in a population of a million and a-half. There will, no doubt, too, be great loss of life from this cause long before the extreme point of endurance has been reached by the majority. Count Bismarck has called attention, in a circular to the German ministers at foreign courts, to the terrible consequences which are likely to result from a prolongation of the resistance to the starving point. The railroads and canals have been destroyed by the French for many miles in all directions from Paris, so that on the day on which the city surrenders from lack of food there will of course be nearly two millions of people on the verge of perishing, and no means of supplying them in less than a week, if so soon. The mere contemplation of such a possibility ought to be sufficient to put an end to the barbarous practice of enclosing populous cities in fortified lines, of which the French have in this war given us three examples—Paris, Metz, and Strasbourg. The only good military reason for making Paris an entrenched camp is, that it is not only the seat of Government, as London and Berlin are, but that Frenchmen have been accustomed by two centuries of minute centralization to look on it as the only possible seat of Government. The consequence is that its fall into an enemy's hands is equivalent in the popular eyes to the loss of everything. The remedy is to throw the provinces more on their own resources, by teaching them the art of local self-government. If the Republic will do this, it will not only do much for the national character, but render the Paris fortifications useless. The best defences of the capital are not *enceintes* and outlying forts, but unconquerable and self-reliant hearts in Brittany, and Normandy, and Picardy, and Languedoc, and Auvergne.

It is to be presumed, of course, that the members of the Provisional Government know their own countrymen, and that, when they loudly accuse Bazaine, and, indeed, nearly every other officer who fails in high command, of treason, they have reason to believe that the accusation, whether true or false, will stimulate the popular ardor. But to the foreign looker-on, who sees that the great difficulty in the way of organizing new French armies is the profound distrust of all commanders, great and small, entertained by the levies, it would seem as if this perpetual crying of treason was as good service as could possibly be rendered to the invader. Organization is impossible as long as all but universal distrust of military men pervades the community. There is not the least reason to suppose that any French generals have really been guilty of treachery in the present war, shameful as have been the *insouciance* and incompetency of a great many of them. The Provisional Government seems to forget, too, that it is impossible to accuse a man like Bazaine, whom it was only a fortnight ago lauding to the skies, of betraying his country, without producing in the minds of all foreigners a profound sense of the thorough rottenness of French society. If a French soldier of forty years' standing—a "Marshal of France" to boot—can make up his mind to surrender a great fortress and a great army to the enemy for anything the enemy can give him, people not unnaturally will conclude that the country which can produce such a moral monster can hardly be worth saving.

On the 9th of October, amid great rejoicing at Florence, a Roman deputation presented to the King the result of the plebiscitum. His reply was remarkable for not alluding to the transfer of the capital, which last month was announced to take place immediately, with a rashness which the Ministry have since had leisure to repent of. The fact is, there are no accommodations at Rome, even of a temporary character, for the Government, and if the proper buildings were to be erected, a space of two or three years would be required. The Government, on other accounts, would be not unwilling to postpone removal. They have undertaken to guarantee the Pope's independence, but it is not so easy to see how they will accomplish this, or how they can reconcile it with the presence of the King in the same city. Giving the former a separate post-office and telegraph office, as has been done, does nothing to settle the difficulty, which on the one hand may involve international obligations, and on the other affects the relations of parties in the Peninsula. As good advice as has yet been offered the Government by its own friends appears to be this: to leave the Romans and the Pope to adjust themselves to each other for a few years, the capital remaining where it is until the new provinces have had time to be educated in liberty, and to indicate the natural solution of the Papal question. The Pope, however, is only a part of the Roman elephant. His debts being annexed along with his territory, the deficit of the Italian budget will be increased by about three millions of dollars in the shape of interest and necessary outlay for various purposes of administration, and the Romans have yet to be tested in regard to their endurance of taxation. Their behavior, however, thus far, has been very generally complimented, and they are said to have exhibited a greater aptitude for organization than that possessed by any other part of the population. On the day of voting, they marched to the electoral urns by guilds and companies, with appropriate banners, as if they had been used to it for centuries.

What effect the surrender of Metz will have upon the success of the new French loan now being negotiated—or should we say offered?—in London, it is dangerous to foretell in this age of financial as of military surprises. The news concerning this loan, although it is announced as introduced by the highly respectable Anglo-American banking firm of J. S. Morgan & Co., seems as yet to partake somewhat of the character of the French postal arrangements generally, being slightly airy and indefinite. On the 24th, it was first announced by telegraph that ten millions of sterling bonds bearing 6 per cent. interest would be offered at 85 (about 14 per cent. less than our 6 per cent. are selling at), and it was "believed that it would be promptly taken up." Nevertheless, the buoyancy in the London stock market was checked by the announcement. On the 25th, the city was excited, "the loan project is received with great favor, and the subscriptions to it are of very large amount already." On the 26th, "books of subscription have been opened in seventy out of the eighty-nine departments of France," and "the success of the loan is now assured." On the 27th, "the prospects are said to be very favorable," since when we are without any additional information from this excellent source. The aspect of the London money-market—scarcely, however, owing to the French loan of fifty millions of dollars—is certainly somewhat less favorable, and prices, including American securities, have slightly declined. But there is nothing as yet to indicate any important change.

In our own markets, neither war nor peace seems to produce any influence worth noting, although the varying rumors of peace created some little excitement in the cotton market, with a general tendency to greater firmness in spite of liberal receipts and favorable crop prospects. Breadstuffs continue unchanged, the supply being rather in excess of the export demand, the latter being limited by a deficient supply of shipping and high freights. General trade is not active—many articles, especially groceries, being affected by the new tariff which comes into force January 1, before when many people will not lay in supplies. Coal, much to the satisfaction of all classes, has materially declined. The most interesting feature of general business at the present time is the condition of real estate, which has been largely dealt in during the week, and generally at lower prices, some large pieces of unimproved property having been sold for one-fourth of what they would have brought a year ago; which must be very encouraging to the insurance and other companies, who have been advancing money on mortgage of similar property to the extent of one-third or one-half its recent market value. Money continues easy, although some efforts have been made to render it artificially scarce. Stocks are dull and without any speculative movement, interested reports to the contrary notwithstanding. Business all over the world appears to be gradually settling down into a far more steady state than it has ever been in since the influence of the great California and Australian gold discoveries first began to be felt in the markets; and as business becomes too tame to absorb all the activity and ambition of fiery spirits, there are indications in other quarters as well as in New York City that public affairs are about to receive some portion of the attention to which they are fairly entitled.

The correspondence between the President and Secretary Cox has been published, and confirms all we have said with regard to the causes of the retirement of the latter from the Cabinet, and puts an end, we hope, to the spread of the impudent invention that it was due to personal reasons. It is, however, on the whole, rather melancholy reading. Mr. Cox says, in plain terms, that his attempts at reforming in his department had roused against him the hostility of the politicians to a degree which might prove embarrassing to the Administration, and that therefore he had, for the President's peace and comfort, better go. The President does not gainsay this statement of the facts of the case, does not offer to support his reforming Secretary against his enemies, and does not even allude to the reasons given by Mr. Cox for his withdrawal, but simply utters a commonplace expression of good-will, and bids him good-by in terms such as would be appropriate if Mr. Cox had been simply taking him for a fast drive on a plank road.

We believe there is little doubt that Mr. Fish will follow Mr. Cox early in the winter, and for similar reasons, and then General Grant will be fairly under the control of the old hands, and without, as we have remarked once before, that familiarity with the ways of politicians and that share of their low cunning which kept even such men as Pierce and Buchanan from getting into worse scrapes than they *did* get into. It would be difficult to imagine a more deplorable termination not only to General Grant's administration, but to his public career. He was elected as emphatically an independent President, but the fact is that he has sunk rather deeper in the mire of abuse than any of his predecessors, except Andrew Johnson. The compensation for all this is found in the fact that nothing has yet happened which has fixed public attention so strongly on the necessity of a reform in the civil service as Mr. Cox's failure and resignation. It is now plain that it will not do to trust even to the most promising President, and that a system must be enforced by law which will save honest officers from being made the victims of the wretched gang who have driven Mr. Cox from the Department of the Interior. We do not remember to have seen on any similar question an expression of indignation from the press so nearly unanimous. The thing for Mr. Cox to do now is to get home to Ohio, and make a clean breast of it before his neighbors; and the thing for his neighbors to do, and everybody else, is to agitate the question till we have the reform of which he has been one of the martyrs.

The most striking political event of the week has been the production by the Democrats of Fisk as an orator, at a ratification meeting, at which such men as Belmont, the banker, and Horatio Seymour figured also, apparently without shame. Fisk's remarks, which were loudly applauded, were in every way characteristic and curiously full of a droll contempt both for the laws and morals of the society in which he lives. He did not say in express terms that he considered the whole machinery of popular elections a humbug, but he indicated it very clearly. The incident was altogether striking and suggestive, and we commend it to the attention of all the moralists, philanthropists, and political philosophers in the country. Fisk is not the product of "caste," about which so many of these gentlemen are troubled in mind; he is the product of corruption, dishonesty, falsehood, and chicane, and you can't get rid of him, or the like of him, simply through "equality" or the ballot.

We said recently that some of the Woman's Suffrage champions seemed inclined not to wait for the Republicans to insert their plank in the party platform, "but were determined to have their plank in some platform or other, and accordingly talked of carrying it to the Democrats, and seeing what they would do." The *Woman's Journal* alleges of this statement "that it would be difficult to condense into the same space a greater amount of untruth than is contained in it," being apparently exasperated into this strong language by our deduction from this and other things that the female leaders of the movement "were displaying a remarkable capacity for a low order of political intrigue." It quotes, in proof of its charge, three resolutions passed at a meeting at the Tremont Temple, in Boston. The first binds "the friends of Woman's Suffrage not to support any candidate for a State or local office who is not in favor of Woman's Suffrage;" and, where no such candidate is nominated, "to nominate and support independent candidates of their own." The second instructs a committee to ask the Republican and Democratic Conventions to insert Woman's Suffrage planks in their platforms. The third directs all friends of the movement to meet in their districts and work for the election of Woman's Suffrage members of the Legislature. With regard to the pleasing little charge of condensed falsehood, therefore, which the writer in the *Journal* brings against us, all that the tenderness of our nature will allow us to say of it, after reading the above resolutions, is that it amazed us; but we may add that nothing of this kind will amaze us much longer.

Anybody who peeps "inside politics" in Massachusetts just now will there witness a fearful scene. As soon as Wendell Phillips got in, extraordinary noises began to issue from the premises, accompanied by dust, tufts of hair, and pieces of coat-tail, and now the bursting open of the door from within has revealed a shocking struggle to the heartless gaze of the worldlings outside. Wendell Phillips is laying on lustily in company with his friend, one Cummings, a "labor reformer," who, according to Mr. Frank Bird, sold the "labor reform" votes to the Hartford and Erie Ring, last winter, for money which he is now using in the present "labor reform campaign," and Mr. Bird challenges Cummings to come into court, where he says he will prove it, or pay Cummings "more money than he ever earned by honest labor." But Wendell Phillips says Mr. Bird belongs to a club of base "managers" who meet in a "grog-shop," whom he describes in terms which, if true, would prove them a disgrace to humanity; wherefore Bird says Phillips has "either lost his wit or memory, or is a deliberate liar," and he is now publishing a series of articles on Phillips in the Boston *Journal*. "Warrington," of the Springfield *Republican*, is publishing another series, and the beauty of the affair is that they have at last got to accusing each other of "lying." The fact is, however, that Mr. Phillips is now doing to the Radical chiefs in Boston what he has been for some time doing to a good many other people; and as these chiefs enjoyed it as long as they had him on their side, we believe that most honest men take satisfaction in seeing him rub their own gunpowder into their wounds. A vituperator and falsifier is always a dangerous animal to train and use, for there is no knowing the day he will turn on his masters. Wendell Phillips has not for ten years rendered any better service to the world than pour forth spicy but incoherent abuse of anybody who caught his attention as he ran along, or the cut of whose coat he did not like, and without any more regard to the correctness of his assertions than Brignoli has for the sense of the libretto. The revelations that his old backers are now making, that he says one thing at one time and another at another, and does not care what he says at any time, is simply a confession of their own fatuity or of something worse, and the world owes them no sympathy either in their sorrow or indignation. Truth, we trust, they will hereafter remember, is not a bit too good for the service of any cause. We hope nobody will separate the combatants until all the crockery and furniture of the establishment are broken. "Politics" will gain by their ferocity, and so will other and better things.

THE IMMEDIATE PROSPECT IN FRANCE.

In judging of the expediency of the persistence of the Germans in prosecuting the war, after the French have suffered what every military man knows and acknowledges to be irremediable defeat, we have no right to consider the conflict now raging as having been begun in July last. Those who say that King William ought to have been, and might safely have been, satisfied with his victory of Sedan, can only have reached this conclusion by shutting their eyes to the whole of French history during the century and a half previous to the battle of Wörth, and by carefully refraining from any examination of French character. As a matter of fact, the absorption of enough of German soil to make the Rhine the eastern frontier of France has been the one fixed object in French policy since the accession of Louis XIV. No régime or dynasty has since dared to abandon it openly. Napoleon I. attained it; Charles X. felt it was necessary to recur to it, and had in contemplation an active effort for it when he was dethroned. Louis Philippe owed much of his unpopularity to his having failed to keep it more prominently in view, instead of turning the national attention to Algeria. The Second Empire, almost as soon as it was founded, began talking of it in pamphlets, maps, speeches, and articles. If anybody will look at the debates in the French Chamber in 1866–7, he will find the battle of Sadowa, which apparently rendered the realization of the scheme impossible, treated by all parties as one of the greatest calamities which ever befell France; and, indeed, the unification of Germany, and the consequent strengthening of its hold on the Rhine, made such a mournful impression on the French mind that the Emperor felt that the safety of his dynasty required him, if possible, to put a stop to it. Had King William, therefore, marched home after Sedan, he could only have justified himself to the German people by being able to show that the French had abandoned an ideal which had been cherished by six generations of the rich and poor, learned and simple, simply because Prussia had inflicted a terrible humiliation on French arms in a struggle in which the feelings of all Frenchmen were so far enlisted as to lead Jules Favre, the leader of the Republicans, to talk the other day of Bazaine, one of the most unprincipled and guilty tools of the Empire, as "our glorious Bazaine."

But to make this theory even plausible, he would have had to go further back, and show that there had occurred in the French character a change so great as to make the people bear serious defeats with perfect equanimity, and look on them as inflicted on them by the chastening hand of Providence as a punishment for their sins and to disgust them with military glory—that is, with the thing which has had for two centuries almost undivided possession of the national heart; for the sake of which, when just emerged from a great revolt against a degrading tyranny in 1794, they deliberately submitted for twenty years to one still bloodier and more degrading, and actually learned to love it so much that the man who was overthrown at Sedan owed his elevation to the popular remembrance of it. That any such change had occurred in French character nobody pretends—not even those who criticise the Prussians most severely. The sole reason they give for desiring Bismarck to trust the frantic promises offered by Favre on behalf of the French people, is that it would be a handsome, kind thing to do, and sound well at public meetings. But the man who did it, and who—when, ten or fifteen years later, France had recovered from her comparatively slight injuries, and her broken armies had returned home to madden the people with stories of the way they had been betrayed by their generals and of the humiliations inflicted on them by the Germans, and opposition orators and poets had begun to fire the popular heart against the government of the day by cries for vengeance on Prussia—turned to the German people for levies to resist a fresh French onslaught on the Rhine, would be a bold and bad man if he could look without wincing in the face the widows and orphans of those who fell at Forbach and Wörth and Gravelotte. No German statesman dare end such a war with such a people by a merely romantic peace. If an American statesman did such a thing, the denunciations of those who are now railing against William and Bismarck would rend the ceiling of every hall in the land.

There may be, of course, a great variety of opinions as to the nature of the guarantees the Germans should exact. We have already given several reasons for thinking the annexation of Alsace and Lorraine cruel and inexpedient. But it is safe to say that no arrangement which left the fortresses of Metz and Strasbourg standing, and in French hands, would be fair and satisfactory. After having stood so long as a menace to German peace, they ought to be levelled or taken away from those who have misused them. To make any peace lasting and effective, too, it would, in the absence of a government sure of the confidence of the French people, be folly to stop the war before the mass of Frenchmen had felt its effects, and were acquainted with its general results.

After the battle of Sedan, what with rage, and with the persistent falsehood and misrepresentation of the Government in Paris, and the bombast of the poets, novelists, and rhetoricians, the French people did not know the full extent of the disaster which had overtaken them. Paris was waiting for the Prussians, "the thunder in her hand," as Hugo said; the Francs-tireurs were going to cut their communications and slaughter them in detail; the Uhlans were "weeping," as they rode about the country, at the thought that none of their comrades would ever see Germany again; and, above all, "the Army of the Loire" was organizing, and "the glorious Bazaine" was holding Prince Frederick Charles in a grasp of steel, till he could get at him and finish him, after having massacred the Crown Prince on the way. There could be no permanent or honorable peace made till this mendacious fog had been cleared away, and the French people were brought once again face to face with the cold, stern, but wholesome truth of the situation.

But even when all France knows, what the world now knows, of its own condition, there would still remain a serious difficulty in the way of anybody who, having vanquished her, proposed to form with her a lasting peace. This difficulty lies in the serious deterioration which, no matter how, has apparently taken place in French society, and which the events of the last five months have brought to light. In the first place, there is something positively childish in the attempts one constantly hears, and which the Republican leaders are now busily making, to establish a broad distinction between the Empire and the nation. All governments not imposed by foreign force are the products of the society over which they rule. There are plenty of unscrupulous adventurers in every civilized country like Louis Napoleon, Morny, and Fleury, who would like to get hold of the government, and make themselves emperors and dukes, and to use the public treasury for their private needs. But in no other civilized country, it is safe to say, could such a gang have done what they did in France. There would everywhere else be enough conscience, and honor, and pride in the people, if not to overthrow them at once by force of arms, to overwhelm them with such hatred and indignation as would make their rule impossible.

In France, they found, after one small fight in the streets of one city, complete and passive obedience. In one short month after their crime, they obtained the popular condonation of it by an overwhelming majority of votes. They afterwards obtained another when the nature of their system had become well known, and the character of its founder been fully revealed. All this did not prove that the Empire was the government best suited to the French people—the ruin it has left behind it shows that it was not—but it makes it somewhat absurd to deny that the French people were responsible for it; and we confess we do not remember a piece of quibbling in every way less respectable than the pretence one constantly hears put forward, that because the people did not approve of the present war by a formal vote, therefore the Germans ought to treat it as a quarrel with the Emperor individually, and sheathe their swords on taking possession of his body. The people approved and upheld for eighteen years the government which engaged in the war, well knowing its character and tendencies; and the doctrine that, under these circumstances, they can avoid the consequences of its blunders and defeats when quite ready to profit by its triumphs, would not simply be something new in international law, but would, perhaps, prove in practice as fruitful a source of political immorality as was ever opened. The follies and barbarities by which the French people avenged its first checks were, too, a sorry preparation for the plea which they now put forward. Nothing more cruel and inhuman has ever been committed since the Revocation of the Edict of Nantes, than the expulsion from France of the 80,000 peaceable and inoffensive Germans—a distinctly popular act, which followed the news of Forbach and Wörth. It was worthily succeeded by weeks of "spy-hunting" which would have dishonored Turks, and by which dozens of helpless foreigners were done to death, not one voice being all this while raised for peace. Bad as was the mendacity of the Empire, too, it is safe to say the mendacity of the Republic has far surpassed it; and small as was the control over the resources of the country which the Emperor appears to have exercised when he went into the field, and insane as were the delusions which he appears to have cherished and spread about the strength of the enemy, it certainly cannot be said that in either of these particulars he outdid his republican successors.

It is undoubtedly the interest of civilization that France should be both great and free, and that her people are capable, with time and harmony, of being both one and the other, nobody can doubt. But they are not true friends of hers who seek to hide from her, now, the extent of her own weakness, and the real nature of the defects which have brought her to her knees before the invader. That these defects are, in the main, moral, nobody can deny. The Empire was born not of force only, but of ignorance, want of principle, want of courage, and want of truthfulness; and any foreign nation which, having suffered from it, and having overthrown it, is called on to make peace with the community which produced it, may well be pardoned if it asks for stronger guarantees than the verbal protestations of those who six months ago confirmed the hero of the *coup d'état* and of the Mexican war on the throne by an overwhelming vote. The fact which has recently been revealed, that the poor man whom this vote crowned for the second time found no difficulty in getting the President of the Court of Cassation—the French equivalent of the Chief-Justice of the Supreme Court, or the Lord Chief-Justice of England—to act as a go-between to negotiate, with a concubine, his release from the paternity of an illegitimate child, gives one a glimpse into a moral abyss which must, in some way, be filled before France can find real political repose, or win the hearty sympathy of those who have—as who has not?—the strongest admiration for the many great qualities of her people and a real human pride in the glories of her history.

THE CANADA BANKS AND THE USURY LAWS.

We have repeatedly pointed out in these columns the fact as well as the cause of the great decline in speculation everywhere and of every kind. Speculation is nothing but a more or less successful attempt to reap advantage from a correct discernment of the fluctuations of prices likely to result from natural causes. Wherever in a civilized community natural causes produce violent fluctuations in prices, there will be much speculation, and then speculation is not only justifiable on the strictest grounds of public or private morality, but becomes positively beneficial, by anticipating the fluctuations, preparing for them, and thus actually preventing or moderating them. The moment the natural causes cease to operate, that moment speculation declines and becomes reduced again to its minimum amount.

There is an entirely different class of operations, which is apt to be confounded with speculation, which indeed grows out of speculation, and which has been the main cause of the general disrepute in which speculation is commonly held, but which is in reality no more necessarily connected with speculation than breaking into a bank vault is with the art of safe-making. If there had been no safe, there would be no temptation for the burglar; if the construction of safes did not become known to burglars and their associates in the process of making them, it would be almost impossible for burglars to break them open. So it is with the operations we refer to. Were there no speculation, could the position of speculative markets be kept a close secret, it would be impossible to do what has in the last few years become known, in contradistinction to speculation, as "manipulating the market." This manipulating of markets, which, though not a crime in the eye of the law, is yet nothing but sheer robbery, comprises operations and combinations of such variety and complexity that it would require columns to give even an imperfect description of them. Some of the schemes have become historical. Nolte's great manipulation of the cotton-market is still remembered by men now living. Two or three bright campaigns in the early days of the great California crash, one or two Chicago corners in grain, the gigantic Harlem harvest credited to Mr. Vanderbilt, the Erie swindle, and, *facile princeps*, the great gold bubble of September, 1869, are fresh in the memory of most of us. Almost all of these manipulations were based upon the existence of large speculative operations, intimately known to the prime manipulators, and out of which they expected to reap their profit. Wall Street, as the great centre of speculation of every description, has naturally been more exposed to these manipulations than any other market. But speculation in Wall Street being more thoroughly dead than it is everywhere else, manipulations there have become next to impossible. There are, however, men who, blind to the fact that all their power, all their wealth, all their unscrupulousness, cannot affect prices without the aid of natural causes, still believe that they can fleece the community, even when the latter refuse to deal with them. Two or three of these men, who are noted only for an occasional and open defeat of their nefarious plans, are now engaged in a manipulation of this kind, which would not deserve notice were it not that it threatens to have a most injurious influence upon the entire financial community in a direction perfectly indifferent to these professional tricksters, but of the utmost possible importance to the entire community, as well as to New York City.

It appears that one of these manipulators, in anticipation of a natural or artificial rise in railway and other stocks, had purchased a very large amount of these stocks, with the intention of selling them at the advance. There being few or no dealings in stocks, the market refused to rise except when the brokers of this "bull" manipulator bought for the purpose of putting up the price. At the same time, another manipulator, in anticipation of a natural or artificial decline in these same stocks, had sold a large amount of them, with the intention of buying them back as soon as prices should go down. The same absence of dealings which prevented prices from going up prevented prices from coming down, and the two manipulators thus stand face to face prepared for battle, each one counting on the events which refuse to come to the aid of either. All Wall and Broad Street stand idly by to watch this fight between a dark, hidden, half-mysterious, silent spider and a gay, lusty, pugnacious, bright-colored blue-bottle fly—the one from his marvellous den weaving dangerous, tenacious webs, the other boldly tearing them aside, trusting to his active wings to escape the meshes.

But now another element appears upon the scene, which alone lends dignity to this petty fight. At this season of the year two changes take place in the affairs of commerce. Our import merchants pay their debts abroad by buying bills of exchange upon London. These bills are drawn principally by foreign banking-houses (who are not, however, as many people think, foreigners, but mainly Americans engaged in banking with foreign countries) upon their correspondents in London, payable sixty days after the time when they are first presented to the London house. These bills, when drawn by responsible firms on well-known English bankers, although not due for sixty days, are almost as good as cash to the holder, for they can be readily discounted at the low rates of interest (two or three per cent. per annum) now prevailing there. The drawer here is not, however, obliged to pay the banker on the other side until the bill is due, so that if at any time within the sixty days he sends over bills drawn by other parties here (which can in their turn be readily discounted), he complies fully with his obligation to his correspondent. Now, at this season of the year we commence the export of our principal staple, cotton, which annually pays for one-half our imports. Sixty days from now, we shall be shipping large amounts of it to Europe, when the shippers will be drawing bills in large sums upon their customers there for the cost of the cotton. These bills will be bought by the foreign banking-houses here, and remitted to their correspondents in London in payment of the bills drawn by them to-day and sold by them to the merchandise importer, who has his debts to pay abroad. It is evident that the foreign banker who carries out this operation in reality borrows money in London for sixty days and lends it here, for although he does not actually bring any money here, he gives to the importing merchant something which is just as good as money in London and without which the importing merchant would be obliged to take the money, the actual cash gold, from here and send it to Europe by steamer. This, then, is one of the two changes that take place in financial affairs about this season—foreign banking-houses lend European capital here, and thereby save this market from the temporary withdrawal of its own capital which would otherwise be inevitable.

It is not to be presumed that these foreign banking-houses carry on this operation from motives of philanthropy—indeed, they derive very handsome profits from the operation, in a way which we will not now stop to explain; but it is very certain that, while deriving a just and liberal advantage themselves, they are at the same time materially and largely benefiting the entire community. For, in the first place, if the bills were not drawn by them, the importer would have to send the gold, and after a little while the cotton-exporter would have to bring it back again, at a double and unnecessary expense, which ultimately would have to be borne by the cotton-planter on one hand, and the buyer of imported merchandise on the other. In the second place, if the gold were shipped away to Europe, it would largely aggravate that other change in financial affairs which we are now about to explain.

About this season the supply of gold is generally at its lowest point. During the summer months we are at all times exporting more or less of it. The production of it is frequently diminished by the dry weather, which stops the essential water supply. The Pacific coast, instead of sending us gold, pays us in bills drawn upon London for California wheat sent to Liverpool and Havre. The merchants have been large buyers of gold to pay duties on their summer importations, and the Treasury has paid out nothing for four months, as during that time no interest falls due. For these various reasons, gold at this season always becomes scarce. If, therefore, the importers were obliged at this time to buy gold for export to pay their debts, which would be the case if the foreign bankers did not draw on London as described, we should probably witness at this season of the year complications of the most serious kind, violent fluctuations in the price of gold, and a consequent general disturbance of our entire foreign and domestic trade. It is, therefore, clearly true, as we have stated, that the drawing of these bills by the foreign bankers is an essential benefit to the entire community.

Now, the largest drawers of bills of this character are the resident agents or branches of some of the Canada banks, which are powerful corporations, controlling large capital of their own and of others, and consequently able to draw large amounts of bills. This fall, as usual, these Canada banks have been large sellers of bills to importers and others, in anticipation of buying sixty days hence, or during the next sixty days, the bills of cotton-exporters to remit to their London branches in payment. While waiting for the cotton to come forward and the bills against it to be drawn, these banks hold, of course, the entire amount of the money received from the importers for the bills sold them, frequently rising to very large figures, and reported now, but no doubt with exaggeration, in the case of one bank alone to exceed ten millions of dollars. This large sum of money the bank naturally lends out on interest until required to pay for the cotton bills which it expects to purchase subsequently, and it is from the high rates of interest which ordinarily prevail at this season (and which would be very materially higher if this money were not lent) that the bank derives the largest share of its profit by the operation. And thus it happens that about this season the Canada banks, as they are loosely designated, become the largest lenders of money in the market; and it is in this character that they become suddenly involved, as third party, in the "blue-bottle-and-spider" fight just referred to.

In a city like New York, where, in spite of our boasted wealth, loanable money is extremely scarce when wanted, and where, owing to habitual "high-pressure and small-margin" bank management the least increase in the demand, or the smallest diminution in the supply, leads to instant and serious perturbation, the temporary ownership or absolute control of even a much smaller sum than ten millions of actual cash is a tremendous power in affecting the prices of stocks; and naturally the two contestants eagerly sought the alliance of the Canada Bank manager, who seemed to them a very god of battles, holding within his hand victory and defeat. The one party naturally sought his alliance so as to borrow his money, in order to buy more stocks and put up the prices. The other party, less naturally to outsiders, but quite as intelligibly to Wall Street, sought to borrow his money or to induce him not to lend it, in order to prevent his antagonist from getting it, and thus compel him to sell his stocks and put prices down. It is said that the manager of the largest Canada bank has not in the past always been prudent enough to keep clear from such entangling alliances, but that he has on this occasion been ever so remotely compromised remains to be seen. It is far more probable that he has lent money to both parties in turn—perhaps to both parties at the same time—and that each in turn has thought to wield the bank's entire power and influence. However this may be, one of the parties to the contest is evidently seeking to gain his object by involving the bank in another difficulty, which is the one that concerns the public in general, and which increases in importance from the fact that it seems likely to enlist considerable sympathy from the press and people, and may, if thoroughly agitated, lead to a repeal of one of the silliest and most mischievous enactments ever recorded upon our statutes.

The enactment we refer to is the usury law. It is highly probable, nay, all but certain, that during the eager contest for the money which the bank had to lend, the borrowers offered, and the bank may have accepted, more than seven per cent. annual interest, placing itself thereby in a very dangerous position for a corporation that has any money to lose, to wit, in the position of a desperate criminal in the eyes of our immaculate, efficient, and ever-watchful city officials. It is boldly given out, possibly only as a threat, that the farce of eighteen months ago, an indictment by the Grand Jury, is to be repeated, but this time with more serious determination, and already public sentiment is being officiously manufactured against the culprit, on the ground that he is, or represents, a foreign corporation, which "comes here to violate our laws and plunder our citizens." It is said that the same parties who were somewhat prominent in last year's prosecution have secured the aid of the same legal talent to convince the District Attorney of the necessity there is of vindicating the majesty of outraged law, and to arrange the ultimate compromise, should one be effected. It is scarcely possible to exaggerate the importance to the entire city of New York of this scheme, should it ever be carried out. With a tariff to destroy our shipping, with an Opera-House manager to ruin the credit of our railroad enterprises in the markets of Europe, with a few more swindling usury prosecutions to drive foreign banking capital away from us, we may soon find ourselves at that goal before reaching which, Mr. Tweed is reported to have said, we shall never resist. "New York, sir, will stand anything while it has one dollar left, and the hope of making twenty-five cents more by dickering with it." Is it true?

BUSINESS MEN AS LEGISLATORS.

A PAPER by Mr. Hamilton A. Hill, of Boston, was read by Dr. Eliot before the Social Science Association at Philadelphia, on "The Relations of Business Men to National Legislation," which is, especially at this moment, deserving of more attention than it is likely to receive as merely a part of the discussions of a society commanding unfortunately but a limited share of public attention. The essential part of this paper commences with a statement which is not new to our readers, but which seems to be entirely lost sight of by the great majority of even the more thinking portion of our voters: "From this time forward," says Mr. Hill, "it will be incumbent upon Congress to devote its time and thought chiefly to material questions. What is the adaptation of Congress, as now constituted, for meeting such a responsibility? Sixty-one per cent. of the members of both Houses of Congress are members of the bar, while only twelve and one-half per cent. are connected with trade, transportation, or finance."

Few persons are aware to what an extent Mr. Hill's description of the future duties of Congress is correct. The seemingly vague term, "material questions," disguises to many minds his true meaning. He should perhaps have said, questions affecting the material welfare, the business prosperity, the income and expenditure, the profits and earnings, the bread and butter, as it were, of every citizen. It is unfortunately true that, in a large measure, all these things are dependent upon the action of Congress in relation to measures which affect them all. The great war of the rebellion rendered necessary, or was at least thought to have rendered necessary, a series of Congressional enactments the result of which has been far different from what was anticipated; which have led to the most remarkable change in the distribution of wealth ever before accomplished without violence; which have entirely arrested the production of wealth in some directions, and in others have led to an unprofitable production; which nothing but the intelligence of our people and the amplitude of our resources have made possible without individual exhaustion and national prostration. It is these enactments that the people are determined to have changed. It is this change that now lies before Congress as its most imperative duty.

There can be no doubt of the correctness of Mr. Hill's statement of the issues to come before the Congress now elected; for the platforms of both leading parties, whether issued by Congressional committees or State committees, or more local organizations, give almost, without exception, most prominence to questions affecting the material welfare of the people. From a very imperfect list of the platforms issued during the pending canvass, we find that no less than eighteen make important planks of the tariff question, eleven take strong ground on the subject of the public lands, eight make an important issue of the national-bank privileges, five complain of legislation injuriously affecting our ship-building and navigation interests, almost every one has reference to the internal revenue, while only three make it a distinct issue. Only two demand a civil-service reform. While these platforms of themselves, or separately, are not entitled to overmuch consideration; while many of them display a profound ignorance of the true nature of the questions with which they attempt to deal; while some of them are contradictory in their various parts and inconsistent with themselves; and while our collection of them is quite imperfect—and a full list might materially change the result—yet the figures given show conclusively enough what questions the politicians at least thought were uppermost in the public mind, on what issues they could best hope to gain popular support. The politicians agree with Mr. Hill, and they are right. The questions now before the country *are* material ones.

Mr. Hill's conclusion is that, the questions now before the country being material ones, the best men to solve them are those who are most in the habit of dealing with material questions—the business men of the community. He proceeds to show, upon somewhat questionable data, that the business men of the community amount to eighteen per cent. of the whole, and that the entire wealth of the country is either produced by them or else is constantly passing through their hands—while they are represented in the councils of the nation by only twelve and one-half per cent. of the whole, against sixty-one per cent. of lawyers and twenty-six per cent. of all other professions. But here occurs a complete hiatus in the argument; for he does not attempt to prove that evil results from this imperfect representation, or that a more perfect representation is possible, or that merchants would necessarily make better legislators than lawyers. The speaker assumes that a more perfect representation of commercial interests by commercial men is highly desirable, and then goes on to show how that may be obtained. But it is precisely this assumption that we feel inclined to contest.

Judging by analogy, we should certainly not be disposed to look to business men for good legislation on business questions, since in a Congress consisting of sixty-one per cent. of lawyers, almost any work is better done than the regulation of legal proceedings or the administration of justice. The various Reconstruction Acts, and, above all, the Georgia Bill, were striking illustrations of the confusion which is allowed to make its way into legislation even under legal auspices; the spirit displayed by Congress in its actual and proposed legislation concerning the Supreme Court of the United States is a still better illustration; the Bankrupt Act, exclusively the work of Congressional lawyers, needs endless tinkering, and furnishes probably more business to our courts of law than any other statute; and, not to go further, the very enactments in which Congress expresses its own will on miscellaneous subjects are frequently so imperfectly constructed as to accomplish results the very reverse of what was intended.

But if analogy leads us to doubt the superior fitness of men of any one occupation to legislate upon the interests of their class or of any other class, what is there in the training and experience of business men to make them an exception to this rule? Nothing whatever. From the earliest ages, when a merchant or a trader was an object of contempt to soldiers, priests, and princes, the mercantile community has been looked upon as the convenient victim of rapacious or necessitous rulers. Even to this day the commerce of all civilized countries is called upon to contribute the largest portion of the expenses of the state, and half the evils suffered by our people during the last ten years of war and war consequences are systematically attributed not by the ignorant only, but by those who ought to know better, to the trading portion of the people—from the hucksters that disturb the rest of the *Times* and the *Tribune*, through the foreign importers who absorb the profits of the interior dealers, to the bankers and brokers of Wall Street, who revel in their ill-gotten gains at the expense of every member of the rural districts, and in open violation of every rule of public and private morality. Since merchants have been merchants, they have been victims of law. Law has hampered them, regulated them, interfered with them, injured their business, and taxed them beyond all patience; and hence the one prominent sentiment regarding law in all business communities is, that it is almost certain to be inexpedient and to discriminate against them unjustly, but that it is useless to struggle against an overwhelming majority, and that all they can do is to adapt their business, as far as possible, to the laws as they find them, or else transfer their skill, knowledge, activity, enterprise, and capital to other fields of operation less injuriously affected by mischievous enactments. No one at all acquainted with men of business can fail to hear our assertion emphatically confirmed, or can have any difficulty in learning detailed cases of the immense injury inflicted upon business by legislation during the last few years alone.

It may be said that this is only another argument in favor of electing more business men to Congress, and apparently the argument is good. But we are considering the question of their fitness for legislation acquired by the training and experience of business, and we say that the habitual struggle with bad laws, the almost unavoidable contempt for all laws, and, worse than all, the daily necessity of seeking to adapt one's self to the consequences of injudicious legislation (and adaptation often means evasion) is the worst possible school for a lawmaker.

There is another reason fully as weighty, and just as little thought of. Trade of all kinds is an endless succession of bargains, a ceaseless repetition of petty struggles between two individuals, each striving to get as much as possible, and to give as little. Whatever the nature of commercial, financial, or even of manufacturing business, it ultimately resolves itself into giving as little as possible and getting the largest possible return. Let us not be understood as joining in the silly outcry against bargaining or dickering. There is nothing dishonest or dishonorable in it; there is no deception connected with it; it is perfectly fair and aboveboard. But it is just the nature of trade that success in it depends upon always getting much and giving little. Of no other occupation is this true in the same degree. The lawyer—the more time, skill, study, and labor he gives to his clients' cases, the more likely he is to win; the more certainly his practice will increase. The mechanic, the artist—the better work they give, the better their pay. The farmer looks for larger crops from fields bountifully manured and industriously tilled. The physician, the clergyman, need no bargain to obtain their reward; their talent, their conscientious labor, bring prompt recognition and pecuniary advantage. The merchant alone at every stage of his career is compelled to keep up the daily struggle to give little and to get much. In no other occupation is it necessary to keep the ultimate gain so constantly before the eyes, and look so steadily at the profit in dollars and cents.

This habit, this necessity, while it creates men of clear, practical insight, of incessant industry, of rapid decision, men of much knowledge of men and of much knowledge of things, at the same time diminishes the ability to look on any subject except for its prospective profit; it disables men, incessantly occupied in the study of their own interests, from examining, much less understanding, the interests of others; it incapacitates them for deep thought on all questions the direct, practical results of which are not readily visible; it produces the habit of considering the entire community as engaged in incessant trade, where each one is supposed to be capable of driving his own bargain, and thereby fosters the belief that no consideration is due to the helpless, feeble, or ignorant.

The very first quality of a legislator should be unselfishness; not only the minor principle which prevents a man from prostituting his position to individual gain, but the broader virtue which enables him to understand the wishes, to study the interests, to assume in thought the position of those for whom he is to legislate. Unselfish, fair-minded, earnest—these are what might be called his moral qualifications. His mental qualifications should be of an equally high order. Nothing is more erroneous than the belief that so-called practical men would make good laws. Law-making is essentially a matter of theory; and although theory without a knowledge of facts is a non-existent delusion, or, at best, the dream of a brain imperfectly developed, yet the knowledge of facts alone is useless, nay, injurious, without the theory that classifies them, that knows their relative importance and their connection with one another as cause and effect. It is only too evident that nothing in the training or experience of men of business is likely to develop in them, to any special degree, either the moral or mental qualifications necessary to make good legislators. They may not make worse law-makers than lawyers are generally found to be; but it is idle to anticipate that a larger infusion of the business element into Congress would necessarily lead to better legislation on the material questions now before the country.

ENGLAND.

LONDON, Oct. 14, 1870.

THE *Times* of this morning announces in its opening leader an event of such thrilling interest that even the approaching bombardment of Paris will for the time cease to monopolize attention. This overwhelming event is nothing less than the approaching marriage of the Princess Louise to the Marquis of Lorne, the eldest son of the Duke of Argyll. The existence of a common bond between royalty and ordinary humanity has been acknowledged in this way before now, but not for some time, and we are once more invited to be overcome by the gracious condescension of our rulers. The daughter of a Queen is to be led to the hymeneal altar—no less poetical language will suit the occasion—by the son of a duke; and as instances are not infrequent of dukes marrying commoners, we may arrive by a mathematical proportion at some estimate of the distance between royalty and vulgar flesh and blood. I could not do less than give to this announcement the place of honor in my letter; though I must regret that the telegraph, with its usual impertinent interference, will deprive the intelligence of the charm of novelty. Of the persons principally concerned I believe that nobody has anything to say but what is in their honor, and British loyalty will, of course, indulge itself in appropriate manifestations.

I sometimes ask myself what is the true value of that passion. As a mere personal sentiment, it is probably weaker than usual at the present moment, in spite of various protestations to the contrary. The Queen has retired more than is exactly wise in a great official destined to be the ornamental summit of our constitutional edifice, and therefore suffering to a rather unfair degree from any social eclipse. The Prince of Wales is distinctly unpopular, although the stories which were current to his prejudice a short time ago do not seem to have had any serious foundation. And yet, in spite of such temporary clouds, the power of what some people call loyalty, and others spitefully describe as flunkeyism, every now and then reveals itself with unexpected intensity. I do not speak merely of such avowed manifestations as may now be seen in Hyde Park, where the monument of the late Prince Consort is beginning to display its gorgeous decorations to passers-by. The statue of the prince is placed beneath a Gothic canopy of solid architecture, surmounted by a lofty cross, with angels at the top and the four quarters of the globe below, and all kinds of historical or allegorical personages looking on from different niches. The quantity of carving and gilding and enamelling is something amazing, and when one reads the inscription, stating that the monument was erected by a sorrowing Queen and people in recognition of a life devoted to the public good, we can only suppose that, if affection be accurately measured by the quantity of money spent in its name, the prince must have been loved more warmly than Chatham, or Peel, or Wilberforce, or any of the great patriots and philanthropists of England. It is true that we have found out some of his virtues since his death, and that, though our affection was previously of a very calm and temperate character, we now generally acknowledge that he was really a very able and useful man in his generation. Supposing, however, that we deduct from the sums spent upon this and the other monuments in his memory with which England fairly bristles that part which is due to genuine enthusiasm, and supposing that that enthusiasm was equal to that with which we regard our purest heroes, there remains an enormous balance to be accounted for in some other way. I do not venture to decide how much is to be set down to the genuine loyalty which is one form of patriotism, and how much to the more objectionable variety which is nearly allied to snobbishness. The task would be in many ways ungrateful; and I will confine myself to the remark that, in my opinion, the genuine article is rather dwindling, whilst the kind which commends itself to the souls of footmen and court tradesmen is undoubtedly rampant and powerful.

We have lately heard some talk about English republicans. The name is rather more common than formerly, and we have some fair specimens of the reality. Yet republicanism does not show itself, nor indeed is there at present much reason why it should show itself, in any unequivocal shape. A certain impulse has been lately given to it by the popular sympathy with France; for I think—though it is difficult to form any accurate opinion—that the working classes are beginning to incline rather to the French side of the question. The Comtists continue to make speeches and call meetings; but the enthusiasm which they excite seems to be still of a languid character. The general impression that the war ought to cease, and that Prussia is chiefly responsible for its continuance, is the only sentiment to be distinctly discriminated. Though I do not sympathize with the contemptuous tone in which these meetings are treated by the press in general, and especially by the poor *Standard*, whose conservative sympathies for France are terribly perplexed by the apparition of these unhallowed allies, I cannot attribute much importance to them. After all, non-intervention is still at the bottom of our hearts, and it is not to be wondered at. A workingman observed the other night that, if we sent an army to France, as Prof. Beesly wished, the Prussians would "eat them for breakfast." There was a painful degree of truth in the remark, and, though Prof. Beesly said that our soldiers were amongst the best in the world, he was obliged to add that perhaps the Prussians would be too much occupied to attack them—which does not suggest a brilliant strategical prospect. Till we can hit harder, we must be content not to strike at all.

As I have been speaking of loyalty, I will notice one fact in this connection. Mr. Trevelyan, a young and able member of parliament, who found himself unable to submit to certain necessities of official subordination and therefore left the ministry last session, has been just addressing his constituents. He spoke upon the subject of army reform, to which he has paid considerable attention. The papers have generally praised his remarks, but they have passed over or treated with great delicacy one observation which was of some importance. He said that the army would never be reformed so long as the Duke of Cambridge was at the Horse Guards. The duke is a well-meaning man, but an obstinate conservative in military matters; and there can be no doubt that the presence of a royal duke in a position of this kind very much hampers reform, and renders more ineffectual than it could otherwise be the supposed responsibility to parliament of the military authorities. This is a fact which may not improbably excite some feeling before long; and Mr. Trevelyan deserves credit for speaking out plainly on the subject. The strange thing is that the divinity which hedges the royal family should have kept reformers so quiet as they have actually been; but there is probably the tacit consideration that if kings are not to have a hand in the management of the army, it will be rather difficult, as the old woman said of the devil, to see what is the use of having any kings. And as I seem to have got fairly into these sublime regions, it is impossible not to be reminded of the great Dr. Russell. An amusing incident has made him specially notorious at the present moment in connection with great personages. He was sent out by the *Times* with a great flourish of trumpets to continue the duties which he discharged in the Crimea, India, and America. There is no doubt that on the first of these occasions he made the position of correspondent more important than it had ever been before, and wrote some really admirable letters. But the poor doctor has somehow lost his old vigor of style. It is to be feared that, in his recent expedition with the Prince of Wales up the Nile, he caught a certain contagion which is apt to be very dangerous to dwellers in courts. The book in which he recorded the history of that journey was a really melancholy performance. And unluckily he seems now to be working in much the same vein. The Prussian authorities received him so civilly that it has been insinuated—not, as I think, with any probability—that the *Times* was attracted to the Prussian cause by the civilities extended to their correspondents. At any rate, Dr. Russell's letters have been devoted to the war only in a secondary degree; and the real pith of them has been the description in the most flowery terms of all the grand personages who have treated him with condescending familiarity. If the impression given be not inaccurate, Dr. Russell must have been hand-in-glove with the Crown Prince, with Bismarck, and with all manner of other notabilities. This being so, he gave us the other day a narrative, which you have no doubt seen, of the conversation between the King of Prussia and the Emperor Napoleon, derived "from the best sources." The best sources could scarcely mean in such a mouth anybody lower than the Prussian Chancellor. Hereupon Count Bismarck telegraphed to all the papers that the conversation in question was founded on "pure invention." So cruel a rebuff was really calculated to appeal to our sympathies. The *Times* did not publish the telegram; but to-day it comes out with an explanation of the circumstances. The official organ of the Prussian Government says something civil about Dr. Russell, explains that the narrative in question was "slightly inaccurate," and declares that the doctor was no doubt honestly convinced that he had it from the best sources. The *Times* is of course triumphant, and says that Count Bismarck's disavowal was merely one of those hasty denials which statesmen are apt to give to any inconvenient revelation. I leave the puzzle to the reflection of your readers. I know not whether Dr. Russell will forgive his antagonists in a Christian spirit; but if it be one of the consequences of this blow to teach him not to put too much faith in princes, or to presume too closely on their intimacy, it will give him a lesson of which he seems to be urgently in need. I may remark that by far the ablest correspondence throughout the war has been that of the *Daily News*, which still retains the superiority in an interesting series of letters from Paris. If it tells us less about dining with princes, it gives far more important details as to the progress of the war.

THE BOMBARDMENT OF PARIS AND THE EXPENSES OF THE WAR.

BERLIN, October 15, 1870.

THE eyes of Germany and of all Europe are once more turned towards Paris, where the finishing stroke of the present war is every hour expected. The French capital is now on all sides surrounded by German troops. They are numerically too weak for the investment of a circle of about sixty miles in circumference—so large is the *enceinte* of all the fortifications around Paris—but, nevertheless, our excellent cavalry has succeeded in hermetically closing all ingress into and egress from the city. If not sooner reduced by hunger, which I for my part do not believe, or by disorder and anarchy, which is more probable, the German generals expect to capture the place before the end of this month—some of them even put down the time between the 23d and 26th for the occurrence of this great event.

It is extremely difficult to move the heavy ordnance and place it in proper position. It must be brought from fifty to sixty miles over a common turnpike, as the railroad has been destroyed by the French between La Ferté and Meaux. The ground around Paris is uneven, often precipitous, and almost all the roads are in a bad condition. Whatever the energy of the commanding officers and the zeal of the soldiers can do will be most cheerfully done, for every man of the army knows that with the surrender of Paris the miseries and privations of the war will substantially be ended. The guns will be put in position by the 18th inst., and can then begin their work. The Parisians are under the impression that their city cannot be bombarded so long as the surrounding forts are not taken, as the distance from the city is supposed to be too great. This view is erroneous, for they are ignorant of the carrying distance of our improved heavy pieces. It is true the centre of Paris is about five miles from the forts, and as our rifled twelve and twenty-four pounders carry only two or three miles, they can only reach the outskirts of the city. Nevertheless, our forces will first try to take one or two forts, and thus gain a foothold for the bombardment of the interior of the city. Besides, our large rockets carry 11,000 paces, and we have also other town-breakers at our disposal—I mean our 72 and 96-pounders, which, being 15 to 17 feet long, and weighing 180 to 200 cwt.—throw, when directed high enough, bombshells of 200 to 300 pounds a distance of five miles. About two weeks ago, I saw them pass through Berlin; they came from our eastern fortresses, and are now being placed in position before Paris. They will open the negotiations for the surrender of the city by demonstrating the terrors of war to its boasting and vaporing population, whereupon the faubourgs will be attacked by the rifled 12 and 24-pounders. The effect of the 72 and 96-pounders is so tremendous that a common house in which their bombs explode is blown to atoms, and that the houses in the immediate neighborhood are so fearfully shattered that they are unfit for further use. A few of these bombshells would be sufficient to destroy the Hôtel de Ville and the other possible centres of resistance. As, with the assistance of detailed plans of the city, the distances can be precisely calculated, these tremendous instruments of destruction do not fire at random, but strike any given point. In this line of its business the Prussian artillery has won some practical experience. Besides Toul and Strasbourg, where it has lately profited in its profession, the Prussian fortress of Jülich (Rhenish Prussia), which had lost its significance in consequence of the new artillery inventions, was, some ten years ago, by order of the Government, used as a target to test the efficiency of the heavy pieces. Thus the Germans feel quite sure of their present undertaking. The late capture of Orléans, and the defeat of the new French army which was in the process of formation south of the Loire, has swept the last possible difficulty which could have disturbed the German armies round Paris out of the way, and has placed one of the richest and most fertile territories of France at their disposal, from which they will be provided with victuals, wines, and other necessaries. The Germans will hence profit from the strategical importance of Orléans as a centre and terminus of the southeastern and southwestern railroads. The next consequence of the capture of the city will be the removal of the Government from Tours south to Toulouse, Bordeaux, or some other place.

The only gain, if gain it can be called, France has made during the last week is the arrival of Garibaldi, who has been appointed commander-in-chief of all irregular French forces. What a perversion of political ideas! One of the most prominent men of that country which owes the possession of Venetia and Rome to the success of the German arms, now fights against us for the benefit of our common enemy, who has torn Nice and Savoy from Italy. But, nevertheless, I pity poor Garibaldi. The old hero has deserved a better end for his past services to humanity than to ruin himself on a Quixotic errand. He fancies himself fighting for the most beautiful of all ladies, the noble maid Dulcinea, whom he imagines to be adorned with all the charms of pure womanhood, while cool matter-of-fact people take her for what she really is—a common and ugly peasant girl. Garibaldi is the most eminent exponent of that radical doctrine so common on the continent of Europe, which confounds the means with the end, and whose believers make the revolution a creed. Thus they become sectarians, and consider it their holy duty to make propaganda all over the world, and threaten the present state of civilization. Every intelligent historical student will admit that the French Revolution was a blessing and a necessity, but he will not deny that its calling and business were only of a negative character. The rotten European society could by no other means be saved from its stagnation and lethargy than by the rupture of its component parts. The French nation, with a real fanaticism for destruction, devoted itself to this business, and thus made itself well deserving of humanity. But the masters of destruction have proved themselves poor bunglers in erecting a new building in place of the old one, and out of the enthusiasm of a great historical movement only imprudent and frantic successors have grown, who fancy that they have the monopoly as undertakers of revolutions, and firmly believe that the world exists for the sole purpose of being pulled down by them. "Everything must be ruined" is their motto—to make room for the new Utopia. "The Empire is peace," Napoleon III. said; but to establish peace there must first be war for the benefit of France. The international league of European revolutionists, presided over by Garibaldi himself in 1867 at Geneva, substantially spoke and acted on the same principle. They will also secure eternal peace to the world, after first destroying everything in their way. This policy emanates from the same arbitrariness of the individual, which puts its own selfish caprice in the place of organic development, and which turns revolutionary infallibility into religion. Its adherents speak the same slang, use the same obscure and abstruse phrases; and as the Catholic Church in "holy Rome," so this radical church of faithful believers sees the centre of the world in "holy Paris." Victor Hugo is not an isolated fool, but the representative man of a whole class, which is spread all over Europe, and even has its apostles among a few hundred Germans and French residing in the United States.

The first duty we have to attend to in Europe is to terminate the era of revolution. Each people is ruled by moral laws, but it has its own national and individual development; each people must work out the forms of its polity and of its civilization, which cannot arbitrarily be checked or accelerated, or forced into strange laws. The question of German nationality having been settled by this war, we have next to build up a commonwealth in the heart of Europe, founded on nationalism in place of Cæsarism, parliamentary institutions instead of personal government, peaceful development under constitutional laws rather than military glory—in short, a state which, working out the oldest and noblest political tendencies of the Teutonic race, will rest on self-government and popular freedom. Garibaldi will do us no harm; on the contrary, his stepping in for the present French republic will clear the ideas of many good but simple men. It will thus contribute to a better appreciation of more rational principles, and finally advance our interests more than injure them.

In order to have a guide for the calculation of damages to be assessed upon France in the negotiations for peace, Bismarck has ordered a synopsis of all the payments made in cash and contributions by the provinces, districts, and cities to the French while they occupied Prussia, then a poor and exhausted country of not quite five millions of inhabitants. The *Staats-Anzeiger*, the official paper, publishes a statement, according to which the amounts paid for the two years from November, 1806, to the end of 1808, foot up to 245,091,801 thalers, to which among others the following cities and districts have contributed, viz.: Berlin and Magdeburg, 57,717,855 thalers; Neumark, 12,252,237 thalers; Pomerania, 25,196,101 thalers; East Prussia, 57,080,261 thalers; West Prussia, 34,319,901 thalers; Lithuania, 10,088,886 thalers; and Breslau, 18,520,659 thalers. The French occupation of what was then called Prussia lasted about six years and a half, so that in the above proportion she paid for the whole time about 750 millions of thalers. The other German territories which now belong to Prussia were bled in the same way; it is consequently a very moderate estimate if we assume that, besides the losses in war material and the contributions paid by the defeated government, what constitutes present Prussia paid 2,000 millions of thalers to the French. At that time, money was worth three times as much as in our days. If we nevertheless ask only 2,000 millions of francs, or about 500 millions of thalers, as cash damages from France, I think the demand will be a very moderate one. In making up a final settlement, our diplomatists will probably arrive at a somewhat higher figure, as, for instance, the damage done to our shipping interest and to the brutally expelled Germans from France, as well as the expenses for boarding 160,000 French prisoners, are not included in the above bill. Each of our poor landwehrmen should have his daily wages paid at a moderate rate of say one-third of a thaler—24 cents—from the moment of his leaving home to the hour of his return. The costs for buying even, small annuities for our cripples and invalids will amount to at least 50 millions of thalers, for which France, of course, will have to come down. Besides, there are thousands of losses which cannot be compensated. Apart from the field-hospitals, we have at present in our military and private hospitals alone not less than 78,000 sick and wounded, not one-half of whom will fully recover.

FRIEDRICH KAPP.

THE PRUSSIANS AT VERSAILLES.

[THE following remarkable piece of description is from an American boy of 16, and sent to his father in this country.]

VERSAILLES, Sunday, Sept. 18.

Just now, Louis (the servant) came in and said the Hulans were at the Mairie. We all rushed out; on the way I passed some officers of the Garde Nationale calling to arms, drums beating, people excited, some running, others talking in knots. I hurried on, and soon saw a large crowd in front of the Mairie. It appears three Hulans, rambling ahead, had lost their way, and had stumbled on Versailles while reconnoitring. They were bold enough to ride up to the gate and demand admittance, which the porter—who was a buzzard of the first water—gave them, and they came prancing in, driving terror and dismay with them. They said they wished to be directed to the Mairie, after having looked round as much as they liked. When they got to the Mairie they asked the Mayor on what conditions Versailles would surrender. The Mayor said "he didn't wish to have anything to do with them, but would see their officers." They answered, "Very well, there are five hundred of us outside. You come to the gates." He agreed, and they galloped off. By this time there was a dense crowd and lots of Garde Nationale, all talking and wishing "to put a couple o' balls in their nobs, and prevail on them to stop." But they got off all right, and in a short time the Mayor and a lot of old pods got into a large carriage, and (with an escort) started to meet the Hulans at the gates, and soon returned. Not a single Hulan was to be seen at the place where the three foxy Prussians had agreed that five hundred should meet the old pods. These knowing fellows had been into Versailles, seen the place, the Mayor, the people, found how few soldiers there were, and what large accommodations for soldiers, in fact, all that the enemy wanted to know, and then quietly rode off unmolested.

Every one was awfully mad, and the crowd were all swearing, when all of a sudden a soldier, such as I had not seen before, galloped up full speed, covered with dust, and rushed to the Mairie; the gates opened, and he went in, leaving the crowd waiting outside in suspense. In two minutes out he came and galloped off. All this seemed very mysterious. In ten minutes he returned from the woods with two others and a bugler. Every one thought they were Prussians, but they were "Guides" sent out from Paris to scout, and bring information of the enemy. They said there was a battle then going on. Two of their party had just been shot, and they called for a surgeon for somebody who was wounded somewhere, and then dashed off in desperate haste, to get back to Paris before the enemy could cut them off. This was very exciting, and I staid about a long time, but didn't hear more.

Monday, Sept. 19.—This morning, on coming down to breakfast, we found a great commotion. We heard heavy cannonading, and could distinguish the deadly roll of the mitrailleuse. There was a great deal going on in and outside of this house (Hôtel des Réservoirs). All along the streets were every kind of cart and carriage, men tacking on red crosses, surgeons and *infirmiers* hurrying round. We found they were going to the field of battle. Great numbers of men were offering aid, and numbers of priests and Sisters of Charity were getting the stretchers ready. I ran down and filled lots of tin cans with water for the wounded. At length all was ready, and they went off. Aunt Mary and I then went to the work-room, where they were very busy, and everything to be done right off. The Prussians had sent word to send all "secours aux blessés" immediately to the field. So Aunty sewed, and I tore paper for cushions and cut out red crosses for three hours, and then went home to breakfast. After breakfast L. and I went to the Place d'Armes, and saw two wounded Hulans being helped into the palace. At the Mairie there was a great crowd, and we stopped a minute. All of a sudden there was a shout and a rush of people, and up galloped eight Prussian cuirassiers with an officer. They had light hair, and were very thickset, but small, covered with dust, dirty and torn clothes. They had good horses, but they looked very tired. They wore the Prussian helmet and spike, a sabre on one side, and on the other a huge horse-pistol two feet long; and they carried little carbines in their hands, all ready if they should be necessary. But all the French had left, except a few harmless Nationales. So they met with no opposition. They waited a minute, then clapped spurs to their horses and went off full speed. The people seemed very sad. Many women were crying, and many men looked as if they would like to.

Then we walked on and looked down a road, and through an arch in the distance, beyond which the road made a turn, and we could see no further. Suddenly we saw a troop of horsemen come through the arch; behind came more and more and more. We were uncertain whether to run or stay, so we stayed, and they came up. The first were fifty Hulans; then fellows in blue, on horseback, very handsome; next three very funny ones, with silver death's-heads and cross-bones on their hats; then hundreds and hundreds of mounted fellows with needle-guns and sabres. Then three regiments of infantry, marching in superb time. Every five hundred men had a drum corps and fifes playing in perfect unison. You could almost feel the ground shake with the steady thud, thud, thud, tramp, tramp, tramp. I declare it was splendid.

All these men looked dirty and tired, but fat, jolly, and laughing. Looking down the road as far as we could, we still saw the helmets, spikes, and guns, all leaning exactly the same way, and glistening in the sun. All the officers looked like perfect gentlemen, with great whiskers, and jolly, fat faces. None of the men talked, much less sang, the way the French do.

At last these passed, and then came a splendid band of sixty pieces, playing beautifully, and then regiment after regiment of cavalry (not carrying nearly so much as the French cavalry do), but horses in excellent order, many very handsome. Lots of the soldiers were smoking great German pipes (such as you see in Brown, Jones & Robinson's). This was the army of the Crown Prince—less than a third of all that have come. They passed through Versailles, only stopping to mend the roads which the peasants had torn up. After these came artillery and baggage-wagons and carts of ammunition, more infantry, more bands, fifty pontoons on carts, more cavalry, then hundreds of soldiers on peasants' carts, which they had stolen, then ambulances and carts full of wounded (who were brought to our house and to the palace). They began to come at a quarter past one, and passed our house till half-past four; and I saw just as many more going by another road, where they passed till seven at night. I saw all along the street the people saying "Oh!" in such a sad way, and the women crying; and I noticed two French soldiers surrounded by little Prussians. One was a soldier of the line; he was crying like a child, all his arms were taken away; it was very sad. The other was a giant of a cuirassier, who stalked along in a most dignified manner, with his head up in the air, and hands in his pockets, looking as if he despised these dirty little fat Prussians, and was "merely overcome by numbers." He stepped along in a jaunty manner, and I couldn't help thinking how much he looked like that picture of Jones being carried off.

There seemed at times to be a hunting corps, for every man would have a fat hare or rabbit, and hens, ducks, pheasants, partridges, slung on his back. One man I saw with a live sheep, full size, over his back.

Only four regiments of infantry, one of cavalry, and four batteries of artillery remained here all night. They camped upon the Place d'Armes, and lit fires and cooked. Everything was in perfect neatness—the cannon and powder-carts arranged in order in a circle; horses all fastened inside the circle; soldiers all sleeping round outside. They took off their knapsacks, stacked guns, put their helmets on top of their bayonets, unrolled their greatcoats, and lay down, still having on swords and pistols, and their guns at arm's length. Thus they pass the night, rain or shine (no tents), and they look as hardy and strong as lions. Their discipline is something wonderful. I saw a drum-major tell his corps to stop drumming, and all did but one, who hit his drum with one stick after the others had stopped. The major rushed up and cuffed his ears, and took away his sticks, and then told the others to go on, while the crowd laughed.

All last night, till twelve (and long after, I dare say), there was a continuous rumble of carts and gun-carriages. In the evening the ambulances returned, bringing lots of fearfully wounded men. We saw them as they were taken to the Palace. In the afternoon, officers came to our house, and marked in chalk the names of the counts and generals, and all the rest of them, on the doors of the rooms they were to occupy.

To-day (Tuesday) the barracks are filled. You understand I began this letter yesterday, Monday, and am finishing it to-night.

I feel that this is the greatest sight I ever shall see, and enjoy it greatly. It alone is worth coming 3,000 miles for. Now, I don't wonder that the Prussians beat, since I've seen what soldiers they are. The people seem much less frightened, and more friendly to them than I supposed. Lots of the peasants can talk German; and when the Prussians halt, they chat away, and interpret to the eager listeners, who laugh and give them wine and water. One Prussian asked L. for some "schnaps." L. said he had some for the wounded, but none for him, and added, "There are plenty of schnaps in Paris," at which he laughed, and said "he would soon get it then." Lots of the soldiers asked us the name of this place, and whether Paris was fortified, and how far off it is.

I saw a young girl give a handsome Prussian officer some claret, and when she came back, an old man and woman called her all sorts of names and slapped her. There was a great row, and she fled with her sister. A Prussian patted me on the head as he passed. All the infantry are small men, and the officers large, tall, and very handsome and clean.

When they stopped, they seemed to have good dinners of bread, cheese, butter, sausages, and wine. In the evening they were very jolly; lots of fires flickered all round, the soldiers singing and smoking; many were milking cows they had stolen, and cooking game. It was all very pretty. The formal way in which everything is done is very curious. At every gate where officers live there are two guards, and every time an officer passes, these sentinels go through five movements with their guns. On all the doors of all the houses are marked, in chalk, the names of the men stationed there. To-day they laid a telegraph through the street, connecting every officer's house with the Mairie.

Wednesday.—To-day I got up at seven, and went down to the Place d'Armes, and found it filled with Prussians; some sleeping, some cooking, building fires, eating, grooming horses, washing cannon, and all smoking. There were but two tents, belonging to high officers. In front of one was a great swell dressing. He had two men waiting on him, and a guard pacing up and down in front of his tent, with a drawn sword. When I got there he was brushing his hair and putting on his cravat; a little French boy was holding a glass for him; he had a bright-red shirt on, and boots up to the hips, and large silver spurs. When I came back he had dressed himself, and his horse, a beautiful great black one, was brought up. His coat was covered with decorations, and he had a very brilliant sword. He looked exactly like Mr. T. S., and was a very big wig, evidently.

In the other tent there were two officers at a table, writing. They had about fifty bottles of claret and champagne piled up by their tent, and a guard by it.

In a little while all was bustle, but no confusion. All the cannon and powder-carts were arranged in numerical order; the horses the same; and every bucket and every pot was numbered like the cart to which it belonged. Soon the bugles sounded; every man jumped, and knew what he had to do. There was a ringing and rattling of chains, and the horses were fastened to the cannon; soldiers gobbled their last mouthful, strapped on their knapsacks, and in a few minutes everything was moving; officers giving their orders; the horses neighing; the line was formed, and off they went.

When I got home I found the ambulances just going off again, and Prussian officers giving orders about the rooms to be prepared for the Crown Prince, who was to arrive at one o'clock.

After breakfast the troops began to pass again in a steady stream: "The King's guard of honor" they were called. Some brought in prisoners—poor peasants who had made a faint resistance against their houses being pillaged, and horses, and cows, and sheep being stolen. They had fired on the Prussians, and were to be shot; it was very sorrowful. We heard that the Crown Prince had pardoned them, but it is not confirmed. Also, some noble Zouaves were brought in, and the crowd cheered them. L. saw a German boy with a French bayonet, and the people were laughing at him, and a little French *gamin* went up and gave him an awful kick; it caused much merriment.

About one o'clock came a squad of Hulans, with long lances and black and white flags. After them came men on horseback leading other horses, all very beautiful, and belonging to the Crown Prince. About two hundred passed—then the royal baggage, cart after cart, mostly painted purple, with a great gold crown. Amongst them were some carts which had belonged to the French. One of the bands had a brass drum with the Imperial eagle and "3d Zouaves" painted on it; the soldiers showed it to the people and laughed. After the baggage-train came a group of the most elegant and beautiful soldiers I ever saw, every one different; they came to get things ready for the Prince. We found he was to be received at the prefecture, which is a large and handsome building with a huge court in front and a black-and-gilt fence and gate, such as they have round the Park and Palace.

We went there at once. The *Garde d'Honneur* were drawn up in front, and a full band on each side of the gate. In a few minutes up galloped some hussars with great silver skull-and-bones on their hats, and all the troops presented arms. Then came lots of Hulans, and more death's-head hussars, and then the Crown Prince surrounded by his splendid and numerous staff. Gen. Sheridan was not there. The Prince is quite handsome, with large bushy beard and moustache. He was dressed like the others, and wore a cap such as they all wear, with a scarlet band, and he had lots of decorations and a large diamond star. They all had most beautiful horses and looked very kingly. It was a splendid sight; the bands all played a smashing tune, and the soldiers all presented arms. The Prince rode in front of them; then they marched into the court-yard and took possession (as it were), and the Prince and his suite dismounted and entered the house. There was a great crowd, and it was indeed a fine sight.

Next day he went to the palace on foot with two generals. Gen. Sherican arrived and has the room next to ours. I met him and his aid in the entry. He spoke to me in German, then in French, and then said, "Well, what are you?" He seemed to be pleased to hear that Americans are here, and was very communicative. He told me lots of news about

Metz and Strasbourg, and the Germans, all of which you know, however. He came to see grandpa, and is very nice and agreeable.

He says everything is laid waste the other side of Paris, and that they have been fighting at St. Cloud and Asnières; that first the Prussians would take something, and then the French would come out from Paris and retake it. He says Bazaine has no chance in Metz, and is now eating up his horses.

We now hear cannonading all the time. The Prussians look very blue to-day, Sept. 25. Troops are hurrying through, and we think they must have been beaten. The Prince left yesterday to see the King at Ferrières, and returned to-day. They have turned all the French wounded out of the Palace into the city hospitals. I saw lots of wounded Turcos; Aunt Mary went up and saw them and gave them chocolate. We have laid in plenty of ham and flour. We hear that butter will soon give out here.

Prussian swells drive about in dog-carts, with servants in livery behind them.

Later, 25th.—To-day there was a great review in the Place, only about 15,000 men, but it was very beautiful—a superb band playing. We saw the men all inspected to see if they were clean, and neat, and hadn't French real estate on them. Soldiers go off in hay-carts foraging all the time. Cannonading still goes on. We see balloons going up all the time.

Correspondence.

THE ANNEXATION OF ALSACE AND LORRAINE.

TO THE EDITOR OF THE NATION:

SIR: Permit me to hand you herewith a copy of the *Weser Zeitung*, of the 13th instant, and to draw your attention to its leading article on the annexation to Germany of Alsace and part of Lorraine, as a condition of peace between that country and France.

I know that I speak the sentiment of many Germans in this city when I express to you, as I have long wished to do, my warm acknowledgment of the rare ability, independence, and justice with which, from the beginning of this grand struggle, your paper has interpreted the cause of Germany to the American public.

The only point on which a German can take exception to your views is that of annexation, and I confess to you that, when that question was first raised, I was inclined to side with you against such a demand, fearing that my native country would thereby be drawn into that unprofitable policy of conquest which we so much condemn in France, and which would justly wound the susceptibilities of such neighbors as Switzerland, the Netherlands, and Russia. A careful observation of public opinion in Germany, as expressed by their leading journals and numerous pamphlets published by their most eminent political writers, has, however, convinced me that the all but unanimous desire for the restoration of those provinces to Germany is not based on grounds which would justify such fears, but derives its strength from the earnest conviction of the necessity and the justice of that condition of peace.

You will observe that the enclosed article deals with the question only with a view to its political justice, leaving its more important feature, that of its necessity for the future security of Germany, for future treatment. As far as it goes, however, I think you will find the argument well put.

I will not pretend to change your own views on the subject, but I venture to suggest that, by translating such articles or stating their substance, you would further interpret to your readers the existing public opinion in Germany, and thus add to your claims on the gratitude of your German fellow-citizens.

I remain, yours, very respectfully,

GUSTAV SCHWAB.

NEW YORK, Oct. 31, 1870.

[The argument of the *Weser-Zeitung* is ingenious, but not much else. It is in substance this: That Germany has not, as has been alleged, done, in the case of Schleswig-Holstein, what France did in the case of Alsace and Lorraine. Schleswig-Holstein is a German province, and what Germany did was to prevent Denmark making it Danish against the will of the people. Nor does the partition of Poland by Frederic the Great resemble Louis XIV.'s raid on Germany; but, supposing it did, the kingdom of Poland no longer exists, so that there is nobody to give back the plunder to. If the kingdom of Poland did exist, however, and it stood in the same relation to Germany that Germany now stands to France—that is, if the King of Poland had seized on Dantzic, Thorn, and Posen, and were besieging Berlin—the Germans would at once "acknowledge the corn" and give up the conquered provinces. (We confess we find this hard to believe.) However, the origin of the German title to Posen is far better than the French title to Alsace and Lorraine. Frederic the Great took part of Poland in order to rid his border of anarchy and confusion, and prevent Russia taking the whole, or, to use the *Weser-Zeitung's* words, "as a painful necessity;" while Louis XIV.'s seizures were naked robbery. (We also find this very hard doctrine.) But no matter how Prussia got her share of Poland, neither France, Austria, nor even moral England can decently call on her to make restitution. They have all done the same sort of thing. England, luckier than most of her neighbors, committed her principal rascalities at an early period, when men's nerves were tolerably strong, and when there was no European public opinion to condemn wrong-doing. Nobody defends her mode of acquiring Ireland, but what sensible man would call on her now to atone for it by handing Ireland over to the Fenians? She has atoned for it by giving Ireland a higher civilization than Ireland would probably have got of herself, and Prussia has atoned for her seizure of Poland by doing the same thing for her share of that country.

The main point in the argument, and, indeed, we may say the only strong one, is that whatever right to Alsace and Lorraine France may have acquired by prescription, Germany has for two hundred years respected. It has now been swept away by France's own wilful aggression on Germany, who may therefore lawfully fall back on her original right. In the whole article, however, we do not find one word with regard to the feelings of the inhabitants, although the consideration which weighs most with us, and, we presume, with the greater number of foreigners who are opposed to the annexation, is the hearty attachment of the people to France. They are Frenchmen in the only way in which men can really belong to a nationality, and that is through affection and tradition. To make them Germans, now, by way of punishing the robberies committed by Louis XIV., is to treat them like cattle that had been "lifted" by a moss-trooper. That Germany would be justified in doing it by precedent, we do not deny; but one of the advantages of being as strong as she is, is the ability it gives her to do without the support of precedents. As the world has hitherto gone, doubtless her demands are not unreasonable, and she may fairly be forgiven for not abating them as long as she is met with shrieks and war-whoops, poems and epigrams. But if France ever gets her senses back, and offers to treat like a rational being, most people will look to Germany for something better, by way of settlement, than the letter of the law. Still, we confess we think the Germans have won the right to do what they consider necessary for their own safety, and it does, we admit, amuse one mightily to hear gentlemen and ladies in New York and Boston telling men who have left wife and children, to be mowed down by the mitrailleuse, that they are unconscionable ruffians if they do not go straight home, now that Napoleon has fallen, and trust for future safety to the French love of peace and art and literature. Nor do we entirely appreciate the "library and museum" argument which is now coming to the front. We heard nothing about the libraries and museums of Berlin or Dresden or Munich from any quarter when the French started on their "promenade" last July, and we must protest against the doctrine that a people may go out to rob and murder their neighbors, and when they are foiled and driven home, and followed up by the strong arm of justice, seat themselves at their easels and writing-tables, and wail over the cruelty of tearing them away from their books and pictures. Art and literature must not be used in our day to furnish a shelter or excuse for the passions and practices of a barbarous age.—ED. NATION.]

MORE SENTIMENTALISM.

TO THE EDITOR OF THE NATION:

SIR: Notwithstanding the "sophistries" of my previous "feeble production," which I was unfortunate enough "so clumsily to manipulate" in vindication of Wendell Phillips's philosophy, I hope you will give me a chance to respond by a few plain truths to your ill-tempered criticisms on my communication in your last issue. Your wrath seems peculiarly excited by Mr. Phillips's generous condonation of President Grant's habits of intemperance, in consideration of the other great qualities he daily displays. I cannot wonder at it. Now, sir, let me a simple tale unfold. Why do you grow cool in support of Gen. Grant? Why does Wendell Phillips cleave to him closer and closer? I will tell you. You belong to that honest, doubtless, but small and cold-blooded class known as revenue and civil service reformers. This is evident, not only from the columns of the *Nation*, but I remember seeing your name as one of a little knot of conspirators who last spring met in Washington to organize a crusade against all that is peculiarly American in our political system. You are one of a clique of disappointed men. You thought when Grant was elected President that he was in sympathy with you. Mr. Phillips thought so too. Naturally, you then sustained Grant and Mr. Phillips denounced him. Day by day since that your party has been losing ground; day by day, also, the "Phillips philosophy" has been gaining ground. Consequently, the estimate each entertains of the President has altered. One by one your friends—men who would organize a government on a twaddling system of class examinations, or a petty knowledge of letters and figures, instead of a basis of generous instincts or services rendered to freedom—one by one these men have lost their hold on our noble President. He has come out refined gold from the furnace. Wells, with his miserable formulas as a substitute for the patriotic impulse which alone carried us through the war—he was dropped first. Would statistics ever have freed the slave? Hoar, with his intolerable brusqueness, which was an insult to every generous lover of equality, next followed; then came the turn of Cox, who thought to make a poor knowledge of the alphabet and the multiplication table a stronger claim for place than faithful services rendered through the heat and burden of many a close election—as though reading and ciphering had suppressed the rebellion! Next Fish is doomed—the slave of formulas and traditions, who alone stands to-day between our eager sympathies and the oppressed of other lands. As the President, with that "true patriotic spirit which holds him straight in the public duty the people desire he should pursue," as Phillips himself well says, has gradually sloughed off these barnacles on his administration, you naturally have grown more and more disgusted. Not so Wendell Phillips. He at last recognizes, to use his own words, "the man who reflects the sentiments of the largest number and keeps in the front rank." The gradual development I have indicated you will not deny has been the great characteristic of Gen. Grant as President. Mr. Phillips sees it, and refers to it in his own way when he said the other day that "Grant embodies the sentiments of the American people more fully than any previous President." Now, Wendell Phillips has no faith in your men of formulas and inductions, who would reason on that in regard to which inspiration should be our guide. He *knows* what is right, and does not need to investigate it. So, day by day, as he saw Grant fling off these remnants of an exploded past and put himself in close communion with the beating heart of the people, he revised his opinion of him, and has been generous enough to acknowledge it. *Hinc illæ lacrymæ.*

There is no man in public life to-day so acutely alive to the glowing instincts of his countrymen as Gen. B. F. Butler; there is no man in politics with whom, as is well known, Wendell Phillips is so closely affiliated. The two have long been in hearty accord; and, in fact, "the grim soldier of New Orleans" is the one Massachusetts statesman in regard to whom our great mentor has never felt compelled to utter a harsh criticism. Butler is now a power with the Administration. Boutwell, Chandler, and Morton are men of the same patriotic glow; the chosen advisers of the President, these statesmen are the natural allies of Phillips and Butler. Beaten as you and the formulists are at every point, and seeing the inevitable draw near, I do not wonder you scold at Mr. Phillips and attribute his altered estimate of the President to ungenerous motives; but all these noble men and women who believe in the heart as a safer political guide than the head will hardly share your discomfiture. With Secretary Fish disappears from the Cabinet the last of the barnacles; then at length, and that not shortly, we may hope to see a true American policy carried out by such statesmen as only America can produce, or, perhaps, our noble young sister republic of France.

Before I conclude, will you pardon me for saying that I sometimes wonder if the *Nation* ever appreciates an immortal name or utterance not two centuries old—whether it ever realizes the grandeur of the present times? In spite of the recognized critical ability which marks its columns, and a certain intimate acquaintance with causes and events which induce me to tolerate its shortcomings, I can never lose my sense of its lack of sympathy with the genius of the day. For instance, was anything finer ever witnessed than when Wendell Phillips's friend and our dear sister, Julia Ward Howe, stood up in New York the other day and uttered these immortal words: "Dr. Howe, my husband, once led a crusade against the Sultan of Turkey, flinging a heart of flame against the ice of the century. In like manner I, his wife, here declare war against Bismarck!" You sir, will, I know, carp and sneer at this; Bismarck will not! Count Bismarck is a man of profound sagacity and quick instincts; he will recognize, if you do not, the master-hand striking the key-note of the age; he will cower like the Assyrian of old when he reads this fearful *Mene, Mene* over against him upon the wall. And then to think that laws, the relics of slavery and barbarism, exclude the gifted being capable of this utterance from the halls of national council! But I will not pursue the theme; the cynical columns of the *Nation* are no place for such reflections.

In conclusion, pardon me for expressing the opinion that a few "Phillips's ideas run through the editorial brain" of the *Nation* will do no harm, even if they do come from one whom you sneer at as

A SENTIMENTALIST.

BOSTON, Oct. 29, 1870.

WARNINGS TO "A SENTIMENTALIST."

TO THE EDITOR OF THE NATION:

SIR: Have you not allowed "A Sentimentalist," in your current number, to practise upon you in the same manner as did that famous protectionist, "A Poor Author"? or did the same hand set up the pins and roll the ball? In the former case, it is certainly excellent fooling.

Respectfully, etc., J. P.

PHILADELPHIA, Oct. 27, 1870.

TO THE EDITOR OF THE NATION:

SIR: Pardon me for warning you against the "Sentimentalist" of this week's issue. He is evidently an own brother to the "Poor Author" of last spring, if indeed he is not nearer than that.

Some of our "reformers" use strange arguments and strange logic, but surely not the most sentimental of sentimentalists would attempt to laud the object of his admiration in such sort as this. The man has no more admiration for Mr. Phillips than you yourself. Witness the quotation of this rare piece of egotism: "Well, gentlemen of the press, correspondents, and editors, I belong to a section of men whose example taught you about all you know. I intend to teach you a great deal more before I die." (I give you it as I heard Mr. P. deliver it).

He can only have spoken of Mr. Phillips applying the live coal to Mr. Lincoln in contempt of the former gentleman. If you doubt this, look a little further down, where he gives his idol the credit of "the present *reliable and satisfactory* Republican organization throughout the Southern States." The whole letter is full of similar dubious compliment, but this will suffice.

WM. HAMILTON.

HYDE PARK, MASS., Oct. 29, 1870.

Notes.

LITERARY.

THE quarterly *Record* of the New York Genealogical and Biographical Society is to be enlarged, beginning with the number for January next and the subscription price will be raised to two dollars per annum. It has steadily increased in interest from the first, and should have a commensurate support.——Messrs. Roberts Bros. have in press a reprint of "The Brahmo Somaj," the first and second series of lectures and tracts by Keshub Chunder Sen, edited by Sophia Dobson Collett; and the following books for the young: "Max and Maurice," a juvenile history, in seven tricks, with a hundred illustrations, and "Poesies for Children," selected by Mrs. Anna C. Lowell.——The publishing and bookselling house of Messrs. Oakley, Mason & Co. has removed from down-town to Nos. 142 and 144 Grand Street, near Messrs. Ivison, Blakeman & Taylor, and not far from the Appletons, on the same street.——A suit which we suppose to be a somewhat unusual one, and to have a general interest for the book-trade, has been brought by Messrs. A. S. Barnes & Co. to recover a manuscript from Messrs. Ivison, Blakeman, Taylor & Co. The plaintiffs allege that the author of the work had availed himself of their services and influence to secure certain advantages for his book, and had, moreover, entered into a formal contract to give it to them, a copy of which is annexed to the complaint. Notwithstanding this, they allege that he subsequently placed the book in the defendants' hands for publication, and that the latter, after a full representation of the facts in the case, declined to give it up. This suit is brought in the Supreme Court of Kings County.

—To the German, French, Italian, and Spanish periodicals which are already published in this city must now be added a Portuguese monthly newspaper, *O Novo Mondo*. It is of the size of *Harper's Weekly*, which has also supplied it with most, if not all, of its illustrations, and these will again be recognized as having originally appeared in the *Graphic*. When we look at the contents, however, there is visible an absence of padding and a variety of original matter which indicate an earnest purpose in the conductors. This is stated by the editor, Mr. J. C. Rodrigues, to be to help fix the attention of Brazil and, to a certain extent, South America on the affairs of the United States, not by furnishing current news but by discussing the principles, policy, and progress of this republic. He does not aim to Americanize Brazil or any other country, believing that each people and each race has a development of its own, and under Providence may reach the perfection of the highest. *O Novo Mondo* will advocate emancipation in Brazil, and in fact has an able article on the subject in this its first number, along with others on a university for Brazil, on Grant's administration, the European balance of power, on Cuba and Spain, on neutrality, on German unity, on infallibility; and there is a well-selected miscellany on the events of the day, and relating to the material prosperity of both continents. The book-notices are genuine specimens of criticism; there are biographical sketches of Uhrich, Trochu, Moltke, and Bismarck, whose portraits are given; and more particularly of Sr. de Magalhaens, lately Minister of Brazil at Washington, and of Hon. Henry T. Blow, our actual minister to Brazil; and altogether we must pronounce *O Novo Mondo* from this sample a very respectable enterprise, abreast of the times, and ably edited. We shall be glad if it can assist in giving strength to Dom Pedro's latest purpose to begin the abolition of slavery as the first need of the empire. That it will be a valuable medium for spreading still further knowledge in Brazil of the products of American invention and skill, already so popular there, we have no doubt. It will regularly appear on the eve of the sailing of the monthly packet *via* St. Thomas. Three dollars is the subscription price, and the place of publication, 24 *Times* Building, New York.

—As we have already announced, the *North American Review* is, hereafter, to be managed by Mr. Henry Brooks Adams, who, during the last two or three years, has been among its ablest contributors, and whose establishment at Cambridge as a professor in the college makes it now possible for him to assume editorial duties. For some three years these have been performed by Professor Gurney, whose recent appointment to the office of Dean of the College imposes on him an amount of labor which is of itself enough for one man's strength, and which, joined to the necessary labor of editing a periodical like the *North American*, is much more than the majority of men could well do. Most editors of American periodicals find half their work in the rejection of all except a few of the immense number of articles sent them for acceptance. Everybody believes himself and herself—and there seems not much reason why they should not—competent to turn out the ordinary magazine or newspaper love-story, or critical notice, or poem, or essay; but to get good writing for a periodical of the character of the *North American* must, on the whole, be about the hardest thing that an editor in this country can be called upon to do. The men able to write political, social, educational, philosophical, financial, economical, or literary articles worth the attention of the thoughtful readers who constitute the *North American's* public are so very few, and so very busy, that the task of getting out annually four volumes such as Mr. Norton, Mr. Gurney, and Mr. Lowell have been giving us, is a task far more difficult than it would ever occur to most people to think. And it is true, too, that the people who read such articles are few in number, though each year there are more of them. Not much money can be made by the publication of such a magazine as the *North American* has been; and, of course, not much money can be expended upon it. The fact that, on the whole, it has been kept abreast of its English contemporaries, being better than they fully as often as it has been worse, is greatly to the credit of our American men of letters, who have wanted much of the stimulus which money, reputation, and influence have given their English brethren who write quarterly literature. Under Mr. Adams we expect to see the present enviable character of the *Review* maintained; and we hope to see its prosperity increased. It would be for the general good if the number of newspaper editors and newspaper readers who now see the *North American* could be doubled and tripled, for in all the country there is hardly another source of sound scholarship and criticism in literature, and of careful thought on the questions that should occupy the politician, legislator, and sociologist. To sociological subjects it is said that Mr. Adams intends the *Review* to give particular attention; and as the problems of the next few years of American politics are to be sociological rather than moral, and as for the last decade or so we have been moralists rather than sociologists, most of us may thankfully welcome the help which the *Review* will be able to lend us in the more intricate studies upon which we are just entering. Of absolutely new features, the new management contemplates, we believe, but one—a chronicle, quarter by quarter, of noticeable events in politics, literature, science, and art.

—"The most distinguished descendant of the men who, nearly two centuries and a half ago, founded the city of New York," is recalled to mind by the publication of Judge Charles P. Daly's address before the Century Club, in April last, on "Gulian C. Verplanck; his Ancestry, Life, and Character" (New York: D. Appleton & Co.) In the limits of about sixty pages the writer has traced the descent of Mr. Verplanck and the salient features of his career, in politics and in letters, in a very interesting manner, and with something of the frankness with which posterity is supposed to make up its judgments and record them long after the event. Except in the genealogical part of this address, we do not find much that is new or that needs to be added to our notice of Mr. Verplanck's decease in March. In a literary point of view Judge Daly regards him, as a political satirist under the name of Abimelech Coody, as the "pioneer of a kind of writing in which Artemus Ward and other humorists have been so successful, where much of the effect is produced by the way in which the words are spelled, and in the clever imitation of the style of an illiterate person." He better deserves, however, to be remembered by reason of a single discourse in 1818, before the New York Historical Society, in which he both vindicated Las Casas against the charge of suggesting the substitution of African for Indian slaves—which had never been done before—and started on its journeying as a familiar quotation Bishop Berkeley's line, "Westward the course of empire takes its way." The judicial strength, and almost infallibility, of Mr. Verplanck is naturally dwelt upon by his biographer, who says of his "Essay on the Doctrine of Contracts as affected in Law and Morals by Concealment, Error, or Inadequate Price," which sought to introduce some modification of the rule of *caveat emptor*: "Having been engaged for many years, in the chief commercial city of the Union, in the discharge of duties involving the practical application of this legal rule, I am enabled to say that the law is coming round to the recognition of some of the very distinctions insisted upon in this derided book; and I may add, as the result of my experience, that, if a more strict and just rule had been applied, we should, I think, have had a higher standard of morality in buying and selling, without any diminution of our commercial prosperity as a people."

—By a coincidence of which we shall avail ourselves, there appears in the *New York Genealogical and Biographical Record* for October a discourse on Mr. Verplanck by Mr. Charles Henry Hart, before the Numismatic and Antiquarian Society of Philadelphia, delivered about a month subsequently to Judge Daly's, but evidently independently of it, though there is much that is common to both. In the genealogy it is at once fuller and not so full as the latter. Mr. Hart, for instance, was not informed that Abraham Verplanck, the first ancestor, married his wife in this country, and in 1630. On the other hand, in enumerating the half-brothers and sisters of Mr. Verplanck, he names two sisters not recognized by Judge Daly. With the tone of a professional genealogist, he professes to have shown "each successive generation to have been a most worthy representative of its progenitor," while the character of the Abraham just referred to is conceived by the Judge to have been a sufficient reason why Mr. Verplanck never showed any disposition to write the history of New Netherland. Certainly, his connection with the massacre of the Indians at Pavonia was such as to make him a very disreputable ancestor, of whom to be said to be "most worthy" could only be regarded as a cruel compliment. There was, in fact, perhaps but one trait of his which his descendants did not lose from the admixture of other blood: his carefulness of his possessions, which no duties to the public or to government were allowed to diminish. Thus in 1655, says Judge Daly, "his name appears upon the list of those upon whom a compulsory tax was imposed for the defences of the city; and it may be mentioned as a characteristic, that it does not appear upon the list of those who had previously made voluntary loans for the building of the wall from which Wall Street takes its name." Mr. Hart tells a similar story of him in regard to his quartering English troops ten years later, when, although he had taken the oath of allegiance to the

English, he returned "the decisive answer, 'Cannot take any,'" and had to be assessed in consequence. Passing over his grandson Samuel, who saved his property by a delicate neutrality during the Revolution, and coming to Samuel's grandson, Gulian, we quote from Judge Daly for the last time: "He did little, if anything, during his long life to aid public objects by pecuniary assistance. I have never seen or heard of his name attached to a voluntary subscription for such a purpose." But he defends him, and with good reason, from Clinton's charge of avarice, shows that his fortune had been much exaggerated, and instances the large number of modes in which he was constantly serving the public without the thought of reward or return of any kind.

—The *Williams Review*, a magazine published at Williams College, has begun an act of publication which will strike most people as being, to say the least of it, in very doubtful taste. The editors have come into possession of a series of papers, which they look upon as having been the property of the late Professor Parker Cleveland, who for half-a-century was an instructor in Bowdoin College. It would seem, however, that in strictness these papers were never to be regarded as Professor Cleveland's property in any other sense than that he, as a teacher in the college, received from students in his charge certain essays which were written as college exercises, and which thus, with or without the good-will and consent of the writers, came into his hands and there remained. In all probability, it would be difficult for a collegian to prove at law his right of property in the manuscripts of such literary works as he had produced in obedience to the command of the college authorities; but it would seem that there should be a probability, indeed a certainty, that neither the college, nor any chance instructor in it, should ever be able to publish without the writer's consent the *puerilia* of any graduate, and especially of graduates who, by a lifetime of labor, have made for themselves and hold as their dearest possession a high reputation as workers in literature. Yet the *Williams Review*, having access to Professor Cleveland's papers, announces its intention of publishing the commencement "parts" of Longfellow, President Pierce, Hawthorne, Ephraim Peabody, Senator Fessenden, and other eminent graduates of Bowdoin, and has actually begun with a Latin essay of Hawthorne's. To do so is certainly to take a responsibility which most people would be extremely unwilling to take. One can imagine the acute misery of Hawthorne, say, or the sensitive Fessenden, or even of the sweet-natured and good-tempered Longfellow, at the thought of seeing in print the imposed task-work of his twentieth year. As of Tennyson's poet, it may be said of each of them, that for a generation

> "His worst he kept, his best he gave;"

and that, doubtless, he was nearly as anxious to keep back the bad, as to give us for our pleasure the good. And though it is not well for a man to care too much about such things, nevertheless it is hard on him to be dragged out of what he would assuredly consider a decent and desirable obscurity and reserve. We do not know that distinguished men are wise, or even have the right, to go the length of the late Mr. Edward Everett, and call upon their correspondents for the return of letters written in mature years; though how a correspondent so called on should justify a refusal to comply with the request, we do not clearly see; but in the case of the boyish performances of eminent men, we should say that nine times in ten even the most conscientious and curious investigators of the development of the powers of such men, get not the least really valuable help from listening to their imitative lispings and watching their untried movements; while to other people than these most curious investigators, the investigation is commonly the gratification of the idlest and most futile curiosity. We suggest to the editors of the *Williams Review* that the question for them to consider is not whether the victim can afford the disclosure they meditate, for usually he can afford it, or it would not be made; but whether, if he could have his way, he would wish it, and whether without his wish any one has any right to make it.

LUBBOCK'S PRIMITIVE MAN.*

THERE is a pleasant old story of an honest Scotch farmer, who, waiting for the laird in his library, took up the dictionary for pastime, and, when questioned by the great man as to the pleasure it afforded, replied, "Hey! they're bra' stories, your lardship, but unco *short!*" Something like this is the impression produced by Sir John Lubbock's amusing but rather chaotic work. In his attempt to furnish us data for the study of the laws of human progress, he has gathered from every quarter, with amazing industry and research, a mass of detached facts and observations on the dress, habitations, arts, weapons, customs, laws, superstitions, and languages of savage nations, which furnish an abounding wealth of material for induction, and for which the anthropologist may well be grateful. The induction itself is but faintly and imperfectly carried out; the body of the work is fairly open to Mephistopheles' criticism—

> "Dann hat er die Theile in seiner Hand,
> Fehlt leider nur das geistige Band!"

Only in the appendix is this deficiency somewhat repaired by the two papers read before the British Association at Dundee and at Exeter, in which the author, with great pains, but not very clearly or conclusively, develops his theory of the steady advance of civilization from the lowest to the higher stages, without noticeable periods of retrogradation. But whatever our opinion of his method, or whatever the assent we give to his conclusions, the facts presented by the author's unwearied reading of all the travellers who ever "walked, or flew, or swam, or ran," are in the highest degree curious and interesting, though the perusal of some of his chapters leaves the mind of the render in much the same state as if one had been living for a week on a steady literary diet of "Sunbeams," "Brief Jottings," or any other of those spasmodic and fragmentary columns which, under similar headings, adorn the daily journals.

Those who have groaned under the evils of what a contemporary calls the maternal-in-legal relation, will take a malicious pleasure in Sir John's quotation from "James's Expedition," that, among the Omahaws, "neither the father-in law nor mother-in-law will hold any direct communication with their son-in-law; nor will he, on any occasion or under any consideration, converse immediately with them, although no ill-will exists between them. They will not on any account mention each other's name in company nor look in each other's faces; any conversation that passes between them is conducted through the medium of some other person."

No less singular is the custom existing in Béarn, under the name of *La Couvade*, and among many races of South America, Greenland, Kamtchatka, China, Borneo, Spain, and Corsica, alluded to in Brett's "Guiana" in the following terms:

> "On the birth of a child, the ancient Indian etiquette requires the father to take to his hammock, where he remains some days, as if he were sick, and receives the congratulations and condolence of his friends. An instance of this custom came under my own observation, where the man, in robust health and excellent condition, without a single bodily ailment, was lying in his hammock in the most provoking manner, and carefully and respectfully attended by the women, while the mother of the new-born infant was cooking, none apparently regarding her."

In his chapters on Marriage and Relationship, Sir John Lubbock cites a variety of authorities and observations in support of his thesis that "the lowest races have no institution of marriage. True love is almost unknown among them; and marriage, in its lowest phases, is by no means a matter of affection and companionship." It would be tedious to follow him through the discussion of the various stages of polygamy and polyandry (or plurality of husbands), as of the various races which fall under the head of exogamous, or those who must marry wives from without—and endogamous, or those who must marry within—their own tribe. Many of his facts indicate at least a tendency on the part of primitive races to the state of communal marriage, or property in wives shared with all the members of the tribe. His discussion with Mr. M'Lennan as to the conclusion to be drawn from the actual or typical practice of marriage by capture, if it does nothing else, clearly establishes the fact that the idea of marriage—with us the most sacred, intimate, and tender of all relations—to the savage mind brought no associations but those of wrong and spoliation. The aboriginal wife was a victim and a slave, not an idol or a companion; and the Fifth Avenue bride, as she moves up the aisle to the solemn peals of the organ, blushing beneath her wreaths of gauze and orange-flowers, would sicken and turn pale if she could see her Australian prototype "stunned by blows, with clubs or wooden swords, on head, back, and shoulders," "dragged through the woods by one arm" over stock and stone, and left in the bush to recover from her insensibility as she may, the needful social pleasantness being restored by "a certain compensation price being paid to her relatives."

In strangely logical, but to us shocking, relation with this view of marriage stand "those curious cases in which Hetæræ were held in greater estimation than those women who were, as we should consider, properly and respectably married to a single husband. The former were originally fellow-countrywomen and relations; the latter captives and slaves. And even when this ceased to be the case, the idea would long survive the circumstances which gave rise to it." In singular appropriateness of contrast with the late excited discussion of the "social evil" is the following little bit of Indian history, which reads like a sketch from some Hindoo *Régence :*

---

* "The Origin of Civilization and the Primitive Condition of Man. By Sir John Lubbock, Bart., M.P., F.R.S." New York: D. Appleton & Co.

> "In the famous Indian city of Vesali 'marriage was forbidden, and high rank attached to the lady who held office as Chief of the Courtesans.' When the Holy Buddha (Sakyamuni) in his old age visited Vesali, 'he was lodged in a garden belonging to the chief of the courtesans, and received a visit from this grand lady, who drove out to see him, attended by her suite in stately carriages. Having approached and bowed down, she took her seat on one side of him, and listened to a discourse on Dharma. On entering the town she met the rulers of Vesali gorgeously apparelled ; but their equipages made way for her. They asked her to resign to them the honor of entertaining Sakyamuni, but she refused ; and the great man himself, when solicited by the rulers in person, also refused to break his engagement with the lady.'"

We spare the reader anything more than a hint at the chapter on Religions and Superstitions, from which, as we have suggested above, the student emerges, his head in a whirl with feverish visions of fetiches, charms, stars, idols, incantations, amulets, and the like articles of "bigotry and virtue," and out of which he is lucky if any clear thought or consequent conclusion remains. Very suggestive, however, although not, perhaps, very novel, are the passages about the savage who pummels or mutilates his fetich in order the better to get his will of him, or eats him that he may absorb his qualities. As an illustration of the firm faith of certain savage races in a future state, and their vivid realization of its close and immediate relation with this, the author quotes from Wilkes's Exploring Expedition an account of the Fijians which somewhat strains our powers of belief. The old people, he declares, believing that they shall carry with them, on their journey over to the awful Unknown, the same provision of bodily activity and vigor they possessed at their death, are anxious, on the approach of decrepitude, to be put out of the way as soon as possible ; and it is a high and sacred duty, which no good son will willingly entrust to any deputy, to preside at this friendly removal of his own parents. Thus, Mr. Hunt, on being invited by a young man to attend his mother's funeral,

> "Joined the procession, but, surprised to see no corpse, he made enquiries, when the young man pointed out his mother, who was walking along with them as gay and lively as any of those present, and apparently as much pleased. Mr. Hunt expressed his surprise to the young man, and asked how he could deceive him so much by saying that his mother was dead when she was alive and well. He said in reply that they had made her death-feast, and were now going to bury her ; that she was old ; that his brother and himself had thought that she had lived long enough, and it was time to bury her, to which she had willingly assented, and they were about it now. He added that it was from love for his mother that he had done so ; that in consequence of the same love they were now going to bury her, and that none but themselves could or ought to do such a sacred office! Mr. Hunt did all in his power to prevent so diabolical an act ; but the only reply he received was that she was their mother, and they were her children, and they ought to put her to death."

And the patient old lady was accordingly strangled in pursuance of this singular law of filial affection. After this, the quip about the lover who was so fond of his mistress that he wanted to eat her seems quite simple ; if we could add that the young lady was equally anxious to be eaten, the analogy would be complete. We cannot, however, suppress an emotion of doubt at the closing paragraph, that "so general was this custom, that in one town containing several hundred inhabitants, Captain Wilkes did not see one man over forty years of age, (!) all the old people having been buried."

The author's essay on language, in less than thirty pages, is, of course, hasty and crude ; though replete with ingenious suggestions, original or borrowed, it is, on the whole, an odd mixture of learning and whimsical invention. Where, however, he illustrates the impossibility for the lower savages of conceiving numbers higher than three or four, he gives a very droll illustration from Galton's book on Tropical South Africa, where the traveller, after describing the confusion of a Dammara savage at the stupefying calculation that two sheep at two sticks of tobacco apiece made four sticks, adds :

> "Once, while I watched a Dammara floundering hopelessly in a calculation on one side of me, I observed Dinah, my spaniel, equally embarrassed on the other. She was overlooking half-a-dozen of her new-born puppies which had been removed two or three times from her, and her anxiety was excessive as she tried to find out if they were all present or if any were still missing. She kept puzzling and running her eyes over them, backwards and forwards, but could not satisfy herself. She evidently had a vague notion of counting, but the figure was too large for her brain. Taking the two as they stood, dog and Dammara, the comparison reflected no great honor on the man."

The author's essays in the appendix seem, as we have hinted above, a little confused in statement, and not very consequent in logical form. But without quarrelling with him about route or conveyance, most readers will probably land very cheerfully with him at his journey's end, namely :

That existing savages are not the descendants of civilized ancestors.

That the primitive condition of man was one of utter barbarism.

That from this condition several races have independently raised themselves.

On the whole, the kaleidoscopic picture of human imbecility, cruelty, superstition, and brutal stupidity or insensibility presented by the volume before us is suggestive of reflections far too wide and pregnant for the limits of our review. A very lovely and gifted woman, whose name is now historical in the associations of the great war, used to say that before the broad solid ground of natural likeness and common humanity in all men and women, petty and partial differences of race or temper, habit or education, sank into insignificance. We must sadly confess that we rise from the perusal of this work with a different conviction.

MOLLOY'S GEOLOGY AND REVELATION.*

THE most remarkable feature about this little volume is that it is the work of a Roman Catholic priest—a professor in the College of Maynooth, the fountain-head of the faith in Ireland. It surely is not without meaning that, at the very time that the mother church is making a last desperate fight against the science of to-day, two of its ablest fathers—our author and Pianciani, in Rome—should be at work trying to reconcile its most heterodox teachings with the doctrines of the true faith. His first two hundred and seventy-nine pages are occupied by Dr. Molloy with a tolerably well-written account of the elementary teachings of geology. He evidently knows nothing of the science in an original way, but his training in exegesis has enabled him to ascertain and set forth the essential teachings of the great masters of geology with greater clearness than we find displayed in many synoptical works on this subject from the hands of professional geologists. Some mistakes there are, as when, depicting the life of the triassic time, he speaks of our knowing "foot-prints of birds at least twice the size of those made by the horse or camel." We have guessed at their bird-like character ; the creatures which made them may be, in fact, about as like a "horse or camel" as true birds. But the range of error in the statements is, as may be judged from our example, very small.

The second part of the book covers only about one-third the space occupied by the recapitulation of the history of the globe, yet it is the only part to which the author lays any claim to originality, and this he may fairly claim ; for, although it is in the main a restatement of the arguments which have been made for the correspondence between the geological and Mosaic record, by Cardinal Wiseman, Dr. Buckland, Hugh Miller, and others, there is no doubt that it is on some accounts stronger than any yet made. Yet we cannot but believe that the source of the strength is something which shows the inherent difficulties in the way of a reconciliation of the Mosaic account of creation and that which is given us by the geologists. Of course, at the very outset of his argument, Dr. Molloy endeavors to show that the Mosaic word *day* means not the time of the earth's revolution, but some great division of time. This view is not at all improbable on its face, and we may acknowledge freely that the arguments urged for it are quite convincing. His arguments in support of the idea that there was an interval of indefinite duration between the creation and the first Mosaic day are also very ingenious, and do much to help us to clear away the more apparent difficulties arising from a literal acceptance of the Mosaic record. The infinite cleverness of the educated priest in dealing with all matters of interpretation is beautifully shown in all this preliminary critical work. It is worth reading as a fine specimen of clerical tactics of that difficult kind which can only be compared to the hazardous manœuvre of changing front in the face of an enemy. Under a fire of quotations from the heavy guns of the church—St. Augustine, St. Basil, St. Victor, and much more of the best church ordnance—our author tries to withdraw the forces of the church from positions so long held in defence of the true faith, but which are becoming untenable under the attacks of heretic investigators, to other and stronger grounds for defence. The movement has been well made, but we cannot consider the line of retreat very well chosen. Our author makes the task of reconciliation easy by proving that Moses meant nothing like what his language must have been supposed by his hearers to mean. We do not think any one would maintain that a mortal ever thought that Moses meant something else than a day when he used the Hebrew term for that division of time, until the progress of geological science made it necessary to suppose that he might have intended to have it taken in some other sense. Despite the enormous patience and learning which have been given to the interpretation of this much-discussed chapter of Genesis, our author has not been able to find a single authority among the early fathers who has believed this word day (*yom*) to have the meaning which has been assigned to it by persons seeking to reconcile the Bible and the great stone-book. But at the same time, the accepted canons of criticism are in nowise violated in this interpretation ; and, if it would do away with our difficulties, we might accept it.

---

* "Geology and Revelation ; or, The Ancient History of the Earth considered in the Light of Geological Facts and Revealed Religion. By the Rev. Gerald Molloy, D.D., Prof. of Theology in the Royal College of St. Patrick, Maynooth." American edition. New York : G. P. Putnam & Sons. 1870. 12mo, pp. 380.

Unfortunately, the greatest difficulties lie beyond this point. Having replaced the six days of four-and-twenty hours by as many æons, and beyond all of them existing matter, we then proceed to compare the modified scheme with the geological record. Our author tabulates the result by assigning the Laurentian, Cambrian, Silurian, and Devonian formations to the first and second days ; the Permian and Carboniferous, to the third and fourth days ; the fifth includes the Triassic, Jurassic, and Cretaceous ; the sixth, the whole Tertiary ; and the seventh day, or the day of God's rest, is the existing or Historic age. It is quite unnecessary to tell any geologist that this scheme has no foundation in fact. It may not be important that there is no sort of proportion about the duration of time of the several days, the first two taking probably twice as much time as all the others ; but, to have the scheme mean anything, we must suppose that the divisions between the sections made by this arrangement of the geological record must have some sort of importance. But a broad separation between the Devonian and Carboniferous, or between his second and third days, is one of the things of the old books of our science ; the separation is not more marked than between many geological periods of either set of formations. The separation between the other groups of formations which he takes to represent the other days are no longer believed by geologists of the present time to indicate the same great breaks in the course of events which it was once supposed they did ; on the contrary, each step forward in geological discovery serves to carry further the conviction that the great breaks which once were described as separating the stages of the earth's history were rather in our knowledge than in the facts themselves. Little by little the series of events has been filled out, until now it seems questionable whether any of the great events of the earth's history have been separated from those which preceded or came after them by sudden and extensive changes. The idea that we are living in a period of tranquillity which is only a calm in the midst of great convulsions is rapidly disappearing, so that we cannot hope that some other arrangement of the scheme for parallelizing the series of geological changes by sharing the periods among the "days" in some other way would be more successful than this we have just discussed. And after all it does not seem that the most devoted Christian need trouble himself about the question of the reconciliation of the Mosaic and geological records : there are many statements in the same set of books which have long since been abandoned as literal statements of fact, as clearly irreconcilable with known physical laws, without seriously impairing the faith of mankind.

THE MAGAZINES FOR NOVEMBER.

"Facts in Relation to the Expedition ordered by the Administration of President Lincoln for the Relief of the Garrison in Fort Sumter" is the title of the most noticeable article in the magazines of the month. It appears in the *Galaxy*, its author being Mr. Welles, Mr. Lincoln's Secretary of the Navy, and its object, or rather its result, being to show that Mr. Seward prevented Major Anderson's getting the effectual relief which it was Mr. Lincoln's and Mr. Welles's purpose to send him. Mr. Welles charges, in substance, that had it not been for Mr. Seward's engagements with the Secessionists, the commander of Fort Sumter would have been reinforced and provisioned, and that the responsibility for the fall of that fortress rests not with himself nor with Mr. Lincoln, but with Mr. Seward, who, deceiving the President and overriding the Secretary of the Navy, rendered the expeditionary force of no avail. Precisely what weight should be allowed this accusation, which probably will soon be contradicted, it would, no doubt, be premature to say. It will confirm in their opinion of the late Secretary of State those people who think of him as a veteran politician, with more faith in his own manipulations of other veteran politicians than he ever had in political ideas or in the good sense and good feeling of the party which raised him to office and power. Such persons will see in this paper many things which will make them readier than before to believe that Mr. Seward neither respected nor understood Mr. Lincoln ; but that he was willingly and knowingly a traitor it would require more evidence than Mr. Welles furnishes to make anybody believe who remembers Mr. Seward's career, and can recollect the difficulties and uncertainties of the first winter of the rebellion.

The *Catholic World* has for its most interesting article, so far as concerns the literary reader, a translation by Dr. Thomas Parsons of the First Canto of the "Purgatorio." For the religiously minded reader of American birth, perhaps the most interesting article is a review of the book in which Dr. Kent Stone, some time a High-Church Episcopalian, gives an account of the way in which he became a Roman Catholic. "Prince Clement von Metternich," and a sketch of Rachel, and other articles make the *Catholic World* worth looking at.

Scribner's Monthly opens with a poem by Dr. Holland, who appears to very little advantage as a comic writer. In fact, nothing could well be more undesirable as family reading, by reason of its vulgarity, than this performance of the new editor of a magazine which has for its object to study the tastes and wishes of the average family. "A Day with Doctor Bowles" is a lively and pleasant account, by Mrs. M. E. Dodge, of the New York Juvenile Asylum at Fort Washington ; Mrs. Harding Davis writes the first instalment of one of her intensely disagreeable stories ; the Rev. Mr. Wilkinson takes up the subject of the tameness and weakness of sermons ; Mr. William Morris contributes a poem ; Mr. George Macdonald begins a novel ; Dr. Hayes has a story of Arctic adventure ; and, altogether, *Scribner's Monthly* serves as a good substitute for *Hours at Home* and *Putnam's*, which henceforth it displaces.

The November number of *Putnam's* is one which will make it less easy than other numbers have done for the admirers of this magazine to reconcile themselves to its departure, there being several articles in it which are pleasant reading. Miss Wentworth's anecdotes of Mr. Lincoln's hearing petitions are, if not well told, new ; Mr. Crane's essay on the Indian and Dutch elements of English, as spoken in America, is entertaining ; and the "Pilgrimage to Peking" is opportune.

Of *Harper's* and the *Atlantic* for November it is not necessary to speak, as neither is different in any respect, whether as regards author's subjects or treatment, from the ordinary numbers of these magazines. Mr. Curtis talks agreeably of King William's predecessor and of Father Hyacinth's harmless Protestantism, and Mr. Howells has several very readable book-notices. Readable, too, is Colonel Higginson's "Footpaths ;" and Miss Kate Field's essay on Mr. Fechter's rendition of *Hamlet* will please that gentleman's most enthusiastic admirers.

VALUABLE NEW WORKS
JUST PUBLISHED BY
PORTER & COATES,
822 Chestnut Street, Philadelphia.

The Prose Writers of Germany.

A NEW AND REVISED EDITION.

With Introduction, Biographical Notices, and Translations. By Frederic H. Hedge, D.D. With Six Portraits on Steel and Engraved Title. Imperial 8vo, cloth, extra, gilt top, bevelled boards, $5 ; sheep, marbled edges, library style, $6 ; half-calf, gilt, $7 50 ; Turkey morocco, $10.

"There is no book accessible to the English or American reader which can furnish so comprehensive and symmetrical a view of German literature to the uninitiated ; and those already conversant with some of the German classics will find here valuable and edifying extracts from works to which very few in this country can gain access." —*Prof. A. P. Peabody, in North American Review.*

Mother Goose in her New Dress.

A SERIES OF BEAUTIFUL CHROMOS,

From Designs by the Daughter of one of the very highest officials in the United States Government.

"Original, graceful, and sprightly."—*Public Ledger, Philadelphia.*

"One of the best specimens of chromo-lithography yet produced in the United States, equal to the best productions of that art in Paris, London, and Berlin."—*The Press, Philadelphia.*

"Few books have been issued in lordlier style."—*Evening Bulletin, Philadelphia.*

"A series of chromo illustrations, which display much genius and humor in design, and which are beautifully executed."—*Eastern Argus, Portland.*

Large 4to, bound in cloth, with linen guards, bevelled boards, gilt edges, and illustrative side-stamp, price $4 50 ; cloth, extra, gilt, bevelled boards, linen guards, price $3 75.

In Press:

LONGFELLOW'S POETS AND POETRY OF EUROPE. New Edition just completed, with the addition of 150 pages *entirely new matter*, by Prof. H. W. Longfellow.

GRISWOLD'S PROSE WRITERS OF AMERICA. New edition, revised and brought down to the present time.

SCRIBNER & COMPANY,
654 Broadway, New York.

A FRENCH MAGAZINE

For Learners.

A SPECIMEN NUMBER WILL BE SENT POST-PAID TO ANY ADDRESS ON RECEIPT OF TEN CENTS.

In response to a want often expressed, MESSRS. LEYPOLDT & HOLT (25 Bond Street, New York) intend to begin the publication of a periodical in the French language for the use of general readers, and especially of students in classes.

It will be principally made up of selections from the best periodical literature of France. Each number will contain a portrait and biographical sketch of some eminent Frenchman. To present a great variety of language, however, will be a constant aim, and in deference to it, there will be in each number a chronicle of important events occurring since the preceding issue, a department of answers to correspondents, and a collection of witticisms.

The advertisements (which will be printed in French) will be of special use as means of instruction. It is generally known that De Quincey's great knowledge of Greek was in a large degree due to his habit of trying to translate newspaper advertisements into that language.

In size it will be somewhat similar to the *Nation* or *Appleton's Journal.*

The issue will be monthly, with intermissions corresponding to the general college vacations in July and August.

⁂ The difficulties and expenses are necessarily larger than those of similar periodicals in English. The price will be twenty cents per copy; annual subscription, for ten numbers, one dollar and a half.

American Journal of Science and Arts.

Founded by Professor Silliman in 1818, *and now numbering* 100 *volumes, in two series of* 50 *volumes each.*

EDITORS AND PROPRIETORS,
PROFESSORS SILLIMAN AND DANA.

ASSOCIATE EDITORS,
PROFESSORS GRAY and GIBBS, of Cambridge, and NEWTON, JOHNSON, BRUSH, and VERRILL, of Yale.

Devoted to Chemistry, Physics, Geology, Mineralogy, Natural History, Astronomy, Meteorology, etc.

A THIRD SERIES in MONTHLY Numbers, making two volumes a year of about 450 pages each, from January, 1871. Subscription price, $6 a year, or 50 cents a number.

A few Complete Sets on sale of the First and Second Series. Address

SILLIMAN & DANA,
NEW HAVEN, CT.

Richard Grant White's New Book.

WORDS & THEIR USES.

1 vol. large 12mo, tinted paper, price $2.

This is the most valuable treatise on the proper use of words ever published. Every intelligent reader should have a copy.

The Week.

THE lull in military operations which prevailed after the surrender of Bazaine seems now to be fairly over, and the Prussians appear to resume the offensive in every direction, their forces in the field, as well as around Paris, having been considerably strengthened by detachments from the two armies, the First and the Second, which besieged and reduced Metz. The main divisions of the First Army are to operate in the North, besieging Thionville, Mézières, and the adjoining fortresses on the Belgian border, and advancing into Picardy and Normandy, and those of the Second to join the armies operating against Paris, Tours, and Lyons. Verdun is reported surrendered. The advance on Amiens and Rouen, suspended for a time, has been resumed. Some skirmishing has taken place in the western parts of Eure-et-Loir. The French forces on the Loire, consisting of the Fifteenth and Sixteenth Corps and of the Seventeenth in process of formation, have been concentrated chiefly on the right bank of that river, in the vicinity of Mer, between Blois and Orléans, and, according to latest accounts, have fought a severe battle against the heavily reinforced army under General Von der Tann. The report comes from Tours, and states no result. Bourges seems to be more or less uncovered.

In the East, a severe engagement with no definite result is reported from St. Jean de Losne on the Saône, between Dijon, which was recently occupied by the Germans, and Dôle, the headquarters of Garibaldi. From the latter place the "special correspondent" of the *Tribune* continues to send mournful despatches, quite indiscreetly detailing the almost hopeless condition of affairs in that locality, as well as the despondent utterances of the Italian commander, who is far from meeting, on the part of the French officers and people, with that cordial co-operation which his zeal for the French cause so well deserves and the desperate state of things so urgently demands. Whether General Von Werder is seriously operating against Garibaldi and General Mihiel, who has replaced Cambriels at Besançon, with the intention of cutting them off from Lyons, and perhaps eventually forcing them to lay down their arms on the Swiss frontier, or whether his attacks in this direction are merely feints destined to mask a sudden advance westward, towards Nevers and Bourges, in co-operation with Von der Tann, our information is too scanty and too vague to indicate. If the report which comes from London be true, that south of Belfort "the French have been driven back beyond Montbéliard, the fugitives pouring over the border into Switzerland," the position of Mihiel and Garibaldi must become critical indeed in case of a combined and serious attack. It would certainly become untenable should a speedy surrender of Belfort and New-Brisach—which is hard-pressed, one of its outer forts having capitulated—allow the German forces now besieging those fortresses to pour from Alsace into Franche-Comté.

No active operations of any account have taken place around Paris since the fall of Metz. The news of this disaster, which was made known in that city on the 30th of October, was soon followed by rumors of negotiations for an armistice, and the exasperation of the *peuple* grew to such a pitch as to encourage Gustave Flourens, the cashiered but not removed commander of a Belleville battalion of National Guards, and other "advocates of the Commune," to attempt a *coup d'état* against the Provisional Government. The Hôtel de Ville, where the Government holds its sittings, was, on the afternoon of the 31st, surrounded and forced open by a mob, in spite of some Mobile Guards who defended it. Trochu, Favre, and even Rochefort vainly tried to make themselves heard. The Reds, having invaded the Council Chamber, immediately proceeded to hold an election of members of a Committee of Public Safety, throwing out bulletins to the people below. The names of Victor Hugo, Félix Pyat, Louis Blanc, Ledru-Rollin, Blanqui, and Rochefort were among those honored by the nominations, besides the name of the great Flourens himself, who had arrived at the scene of action on horseback, at the head of his battalion. The members of the Provisional Government were kept prisoners and roughly handled. About 8 in the evening, however, Trochu, Arago, and Ferry were freed by a battalion of National Guards, and by their exertions, which met with enthusiastic aid from every quarter of the city, Favre, Simon, and Garnier-Pagès, who for a moment were threatened with death, were subsequently delivered, and before daybreak order was restored.

Flourens and his associates, however, were allowed to go free, and publicly to continue their denunciations of the unfortunate Government of National Defence, who saw themselves compelled to appeal for a supreme judgment to a general vote of the people of Paris. This was rendered overwhelmingly in their favor, and ultimately emboldened them to promise a vigorous prosecution of all offenders against the public order. The real meaning of the vote, however, is a matter of conjecture, as the verdict may signify the readiness of the people of Paris to capitulate just as much as their confidence in their actual rulers. That scenes like those of October 31 cannot but render all sensible inhabitants of the city, who thus find themselves placed between the fire of the Prussian siege-guns and the no less dreaded incendiarism of the crazy "advocates of the Commune," more and more inclined to give up a resistance which, in any way, has such terribly small chances of success, while it is certain to inflict on them most extraordinary losses and sufferings—can, of course, not be doubted. And yet, while Marseilles and some other cities of the South are exposed to the ravings of demagogues inferior even to Flourens in character—witness General Cluseret and his gang—Trochu and Favre have rejected the overtures for an armistice made to them by Bismarck through Thiers.

These proposals for an armistice have been most profusely telegraphed about by reporters pretending to know all about the matter from the most trustworthy sources, and now and then speaking in the name of very important personages—such as Earl Granville, Laurier, the London agent of the French Government, and Von Kendell, Bismarck's secretary—and yet, after all, we know only that Thiers has been admitted to an audience with King William at Versailles, has talked a great deal with Bismarck, has seen Trochu and Favre, and has failed in his undertaking to bring about an armistice. Nothing definite concerning the terms offered and rejected by either side can be learned. Each side, of course, now accuses the other of stubbornness and disregard for the obvious dictates of humanity. The refusal of Bismarck to grant the revictualling of Paris during the suspension of hostilities and the participation of Alsace and Lorraine in the election for a Constituent Assembly, is plausibly reported to have been the main cause of the breaking off of the negotiations. The fixing of a *status quo* for the invading armies, scattered in numberless detachments over a third of France, and of the ways and means for their supply—when forcible requisition becomes impossible—must have formed another great difficulty in coming to an agreement. On the whole, it is likely that both some harshness in Bismarck's terms and the pressure exercised by the still threatening attitude of the Reds—at Paris as well as elsewhere—have contributed to bring about a negative resolution on the part of the French Government. There may also have been some difficulty in obtaining a harmonious concert by both branches of that Government, during the active continuance of the siege of Paris and of military operations against Tours. But, whatever reasons may have led to the result, we cannot but consider it deplorable, looking at it from whatever standpoint we may.

The agitation for "La Commune," and the confidence felt by the agitators that if they could only get "La Commune" something wonderful would happen, recalls very forcibly the humors of the first Revolution. "La Commune," however, is neither more nor less than the representation of the city in a general assembly composed of two or more deputies from every arrondissement, and the committal to this body of the powers now exercised by the Government of National Defence. It would be hard to say what are the grounds on which it is believed that this assembly would fare better than its predecessors in carrying on the war. What tells most in its favor is, perhaps, that it would be something new—for which, now that it has been found that the Prussians do not fly before the proclamation of the Republic—there is a not unnatural desire.

At the bottom of it is, however, also that curious, almost superstitious, faith in names which is one of the characteristics of all Sentimentalists, and which enables them, after having fastened on a name and grown excited over it, to deduce all sorts of metaphysical comfort from it, and have glowing visions over it, in which the facts of life count for absolutely nothing. Who, for instance, has not heard from the Sentimental platform in this country exhortations and arguments like the following, which Citoyenne Camille Bias addresses to her fellow-women through that tremendous paper, *Le Combat:*

> "The Commune—can it, yes or no, repair the faults of traitors and blockheads, and save France? Yes, the Commune can do so, because it will, because it is the people, and the people is all-powerful, having audacity—having, above all, love. Well, then, women, decree the Commune, and the Commune will be. Can you not go in a mass to the Hôtel de Ville and take possession of the palace of treason as our mothers took possession of the palace of despotism? You do not want guns; you have moral force; you are mothers, you are sisters, you are daughters, and you are citizens—march! If that does not suffice, you will gain it all the same; return to your homes; shut the door against him who does not return bringing with him the honor of the country. Cannot the people take what is refused it, when it is convinced that salvation is there? Courage during the battle goes for little: animals have it. What is necessary for republicans is civic courage. Citoyennes, repudiate those who have it not, and they will acquire it. No longer room at the fireside, no longer a place at the family table, no longer a place even beside the cradle of the new-born, for him who does not know his duty and his power, who does not exercise his rights. No longer a place in our esteem nor in our hearts. Banishment and contempt, these are our arms! They strike well; employ them. Close your doors, you soon will reopen them to see the triumphant Commune pass, and later, when we shall have merited it, Victory, bringing in its train universal peace and fraternity."

The financial affairs of the contending nations continue to attract increasing attention, though the advices, both by mail and cable, are meagre and unsatisfactory. The Prussian loan announced by the Barings has been temporarily withdrawn, which certainly, whatever the motive, does not look like weakness. Nevertheless, even the warmest admirers of the Confederation marvel how even Prussian administrative skill has been enabled to keep its gigantic armies in the field so long without a further appeal to its credit. But that the financial position both of Berlin and Frankfort is strong, is shown by the ease with which the recent Bavarian loan has been paid for in coin, one payment alone of five millions and a half having left the former city in one train of cars—a sum large enough to disturb materially our own market if withdrawn at once, in the midst of peace—a lesson, by the bye, concerning the difference between Continental banking and our own "high-pressure and small margin" system. Of the French loan, over one-third is reported to have been taken in France itself (ninety out of two hundred and fifty millions), and on the London Stock Exchange the new security is quoted, even after the failure of the armistice negotiations, at about two per cent. premium, which must be considered a fair success, considering the desperate state of French affairs, civil and military. In every other respect, the most gigantic war of modern times seems to leave the commercial and financial interests of neighboring nations as undisturbed as it does ours on the opposite side of the Atlantic.

The *Tribune* has lately been calling attention to some very singular discrepancies between the telegraphic despatches received by the *World*, giving an account of a certain monster working-class meeting in London, which called for interference in the war on behalf of France, and forced the Government to put the troops under arms, and threatened the British monarchy with overthrow, and the accounts of the same meetings published in the London papers. According to the latter, the meeting in question mustered about 300 strong, and the proceedings consisted of speeches delivered from the top of a cab, interrupted by the vigorous and somewhat profane protests of the driver. We are also ourselves compelled to call attention to a very remarkable difference between the accounts given by a correspondent of the same paper and those of our own correspondent, of the proceedings at a meeting of the British Cabinet, at which the conduct of Bazaine in surrendering Metz was discussed, and at which it was decided that he was a traitor. Now, our correspondent was present at that same meeting, under the same table, and had procured admission by precisely the same means, viz., the presentation to Mr. Gladstone of a barrel of American pippins—and for veracity and acuteness of hearing he is certainly the equal of the *World's* correspondent. What he says is, that when Bazaine's case came up for consideration, so far from pronouncing him a traitor, it was unanimously resolved that he had defended himself to the best of his ability, and was entitled to the thanks of both Houses of Parliament. How this discrepancy is be accounted for we must leave it to the public to decide.

Unusual quiet attended the elections this week, and nowhere more than in this city, where the Government had made the amplest preparations to preserve order. New York of course went Democratic, though the city majorities were greatly diminished; and the Republicans have lost three Congressmen. In New Jersey, on the other hand, they have gained one, besides the State legislature, which ensures a Republican successor to the present U. S. Senator. In Massachusetts a very heavy vote was polled, and the entire Republican ticket elected. Mr. Phillips had no better following than the labor reform candidate last year, and has hardly succeeded in scaring anybody. Mr. Wilson is sure of being returned to the Senate. Mr. Jenckes, we are extremely sorry to say, was defeated in Rhode Island by the Sprague candidate, Mr. B. T. Eames, in spite of a very damaging charge brought by the former against the Senator of having sold arms to the rebels during the war. Wisconsin, Michigan, and Illinois have gone Republican, with apparently a loss of one Republican Congressman each. Minnesota remains Republican. In Missouri Mr. Gratz Brown is elected Governor, and the Democrats have the Legislature at least. Returns from the South are generally meagre. In Maryland and Delaware the Republicans were successful only in reducing the majorities of their opponents, even Mr. Swann being re-elected. The Republicans have carried Louisiana by a considerable majority, electing four Congressmen, and perhaps the fifth. The result in this city proves pretty conclusively that it is not the machinery which is to blame for the present state of our affairs, but the motive power. The result in Missouri gives the President a sharp and well-merited rebuke, by which we trust he will profit.

The newspapers of all shades of opinion, and in every part of the country, continue to denounce the arrangements which have led to Mr. Cox's withdrawal from the Cabinet with unsparing vigor. We do not, we repeat, remember to have seen so near an approach to unanimity and so much earnestness in the press on any similar subject. As might have been expected, too, the incident has given an impetus to the movement for Civil Service Reform for which, a year ago, no one would have ventured to hope. Unless we are greatly mistaken, the determination of the public is already strong, and grows stronger, that the party which has possession of the Government shall, with all convenient speed, place it out of the power of either President or politicians to permit the recurrence of such scandals as have caused Mr. Cox's resignation. Mr. Trumbull, of Illinois, in a speech to a great meeting of his constituents last week at Chicago, probably traced out pretty accurately the policy which the Republican party will, *nolens volens*, have to follow if it means to remain in power; and the leading points in this policy, according to him, are: 1. A return to specie payments, not by buying up bonds, or dreaming over impracticable funding schemes, but by contracting the legal-tender circulation, of which only a small amount would now have to be withdrawn in order to bring it up to par; 2. The reform of the Civil Service, by the selection of Government clerks and other employees by competitive examination, and their appointment for a fixed period or good behavior; 3. The settlement of the *Alabama* claims somehow—Mr. Trumbull thinks by the cession by England of the British provinces on this continent; but, for the bestowal of belligerent rights on the confederacy, which Mr. Sumner held to be the worst of her offences, he substitutes the deliverance of Mason and Slidell, the settlement of which by Mr. Seward he pronounces by implication unsatisfactory and improper, and declares roundly that the rebel emissaries "stood on precisely the same footing as contraband of war," and though it is now too late to go to war to revenge their rescue, some atonement for it must still be made by England.

We have given some reasons elsewhere for thinking that a demand of this sort will defeat its object, and render settlement more difficult than ever. There are, moreover, certain difficulties in the way of getting satisfaction from England for the *Trent* affair which were great when it occurred, and would now be tenfold greater. Admitting what Mr. Trumbull claims, that belligerents have a right to seize enemy's despatches on board neutral ships, in this case the despatches were not seized, but the men carrying them. Moreover, there is no belligerent right recognized in international law to stop a neutral ship and take certain things out of her, and then let her go on her way. There is not a shadow of authority for any such practice. Captain Wilkes was bound to bring the *Trent* into port, and submit her and her cargo to a prize court, which he did not do. Granting, too, that belligerent cargoes may be seized in neutral ships, can they be seized in ships plying between neutral ports, as the *Trent* was? Could a United States cruiser, for instance, have taken Slidell out of the English Channel steamer between Dover and Calais? And, finally, every foreign jurist and every home jurist who has discussed the question on purely legal grounds, has pronounced the seizure of Mason and Slidell a mistake on some ground or other. So that the proposition of the Chicago *Tribune*, on which it bases its agreement with Mr. Trumbull, "that the ministers, agents, and despatches of a belligerent on board a neutral vessel have from time immemorial been held contraband of war, and legally liable to seizure on the high seas," even if correct as it stands, does not cover, or anywhere near cover, the *Trent* case. Our own belief is that the real offensiveness of England's course in that matter lay, not in her view of the law, but in the violence and precipitation, and even eagerness, with which the Palmerston Ministry prepared to enforce it, before they had heard a word from Washington. But then, who is the statesman who will say that it is not too late to wipe that insult out in blood, or that it is wise to ask England for one of the last acknowledgments of defeat without having the smallest intention of fighting her? There is something positively puerile in making demands which no great power has ever conceded, except after a Sedan or a Sadowa, when our army is hardly sufficient for police duty or our fleet for revenue service.

There have been within the week indications of the way the tide is flowing, widely different in character but very significant. A meeting was held last week in New Haven, at which President Woolsey presided, and at which most of the professors of Yale College were present, as well as many of the principal inhabitants of the city, and at which a warm letter of sympathy, addressed to Mr. Cox, was read, denouncing, in strong terms, the condition of the civil service as the root of much of our political corruption, and expressing the fullest confidence in the speedy triumph of the reform of which he has been the first martyr. The occasion carries one irresistibly back to the letter which was addressed to Mr. Buchanan, thirteen years ago, from the same quarter, touching another reform, which has also since then achieved some success. The second sign is the selection of the "Politician," or "Man Inside Politics," as a subject for his lecture at Philadelphia, last week, by the Reverend Petroleum V. Nasby. The "Man Inside Politics" is a gentleman to whom we have paid considerable attention ourselves, and we may, with all modesty, claim some of the credit of having called popular attention to him as, probably, the meanest and most discreditable product of modern civilization. We now hand him over with delight to Mr. Nasby, and trust he will deal plainly with him, and—as we are sure he can't be reformed—help to kill him.

We are glad to see that the *Worcester Spy* finds it necessary to assert that Mr. Boutwell has no connection with him. We say he has; he is his half-brother, and admires him very much, and helps him greatly. Mr. Boutwell is an enemy of Civil Service Reform; he refused his coöperation to Mr. Fish and Mr. Cox in trying to introduce it, and cautiously withheld even any sign of sympathy with them, and gave the Treasury up to the politicians, and has all along allowed them to make it one of the principal scenes of their "sinful games;" that is, a place in which poor clerks are robbed and tortured, the country cheated of their services, and decency and justice outraged by a pack of knavish intriguers and jobbers; and in this system Mr. Boutwell believes as the "democratic sytsem." Now, don't let us hear anything about his "fidelity" in trying times. That is a reason for not visiting a man's offences severely; but it is not a reason for continuing him in high office to the public detriment. The Administration is not an hospital for veterans. It is rumored that he will have to resign, too, which is what he deserves, for having helped to turn out Wells, who is of more value to the country than twenty Boutwells.

Dullness reigns supreme in all the money markets at home. Stocks continue to be manipulated to some extent by a few of the leading professionals, after a reported reconciliation between the recent contestants, and a sharp rise is looked for. But the public stands aloof, buying neither for investment nor for speculation. Money in New York is easy; in the West and South a moderate degree of activity is visible, with some little signs of uneasiness. Cotton is coming forward very rapidly, and a large crop, from three and a-half to four millions, is confidently looked for. Under active foreign orders, based on the armistice, the price advanced, but has since partially receded. It is difficult to see upon what grounds a maintenance of present prices can be expected in view of so large a crop. Breadstuffs continue to decline. Gold has touched the lowest point since July, 1862. Mr. Boutwell is preparing to force his funding scheme upon unwilling markets, and will probably make mischief, and perhaps cause a revival of speculation in gold, which now seems dead. Real estate has been active and unsettled, but in the main lower. Very distressing accounts are received from California, where the real-estate bubble has burst sooner than elsewhere. Dry goods continue to decline. On the whole, the prospects of consumers generally are more encouraging.

The last number of the *Christian Union*, discussing "Our Judiciary," said:

> "The press is moreover apt to be carried away by local excitement into sweeping and unfounded censures. Thus, some years ago, during a temporary panic, Judge Clerke, who was one of the most thoroughly honest and independent judges in this city, was virulently assailed for discharging a person accused of murder, and at a later period—indeed, up to this very time—the *Nation*, which we consider as usually a model of temperate criticism, has constantly spoken of certain acts of Judge Clerke in terms which nothing but a suspicion of corruption could justify. Yet the *Nation* very rightly favored his re-election within a month after he had committed these 'outrages,' as did all the Republican papers in the city. The fact was, of course, that the editor had never investigated the matter, and denounced as an act of villany a proceeding founded upon law and justice, simply because it was attended with disagreeable results."

Now, we remember no time when we did not hold Judge Clerke in the highest respect; we have no recollection of ever having "assailed" or criticised him for any official act; we doubt, indeed, whether his name has ever been mentioned in our columns, as we have searched our files in vain for the slightest allusion to him. Moreover, we have applied to the editor of the *Christian Union*, without success, for a reference to any passage or passages in the *Nation* in which Judge Clerke was ever even spoken of. We are, therefore, reluctantly driven to the conclusion that "he has never investigated the matter," and has been accusing us of making very foul insinuations against the character of an upright judge by mistake for some other paper. We hope to see in his columns next week either a rectification or such citations as will enable us to apologize or explain or defend ourselves.

THE "ALABAMA" CASE AND THE CANADIANS.

THE *Alabama* case is now in a somewhat curious phase. Our readers may remember that the treaty signed by Mr. Reverdy Johnson was rejected for two reasons; one was that the machinery which it provided for the adjustment of the *Alabama* claims was defective; the other was, that the satisfaction proffered under it for the wrong done to the United States was insufficient. In other words, the mode of choosing the arbitrators was bad, and the work given the arbitrators to do did not cover the ground in dispute. The position taken up by the present Administration has been, indeed, one which all impartial observers, at home and abroad, concede to be sound, namely, that Great Britain owes not only full pecuniary compensation for the losses sustained by the operations of Confederate cruisers built or equipped and suffered to escape from her ports, but something more. Now, what is this "something more?" The failure of our Government to say frankly what this is, is what, at this moment, arrests the negotiations, and, possibly, the settlement of the whole question, for it may be that, on learning what it is, the British Government would concede it. It has been very curious to see how steadily everybody who has touched on the subject has refused to clear up this point, or do more than vaguely, and indeed darkly, hint at it. The claim that England must pay "consequential damages," on the ground that, by her concession of belligerent rights to the Confederacy—or, in other words, her declaration to her own subjects that a state of war existed between the United States and the rebel Confederacy—she worked all the subsequent mischief, has, of course, not been seriously maintained by any respectable authority, and the only result of its public production has been to give a slightly comic aspect, in the eyes of foreign jurists, to the American side of the case. But it is, nevertheless, admitted on all hands that the mere cash payment of the *Alabama* claims, which we believe England is quite ready to make, cannot and ought not to settle the controversy; but the thing which, over and above this, England ought to do, the present Administration, no less than the last, steadily refuses to state, and, until it is stated by somebody, England announces that she will make no further move. Nay, the delay has, if we are to believe the *Pall Mall Gazette*, produced in English opinion some symptoms of a withdrawal from the advanced ground which she occupied on this subject a year ago, the doctrine having begun to find favor "that the rule sought to be enforced against them [us] was a very modern and very doubtful innovation on international law; that the law of nations, regarded in its integrity, did not in any way impose on the British Government the duty of preventing ships of war, constructed by private traders, from getting to sea; that the general and public obligation which that law created was the duty of submitting, without complaint, to the capture and confiscation of such vessels by the ships of the United States." Whenever an American politician takes up the question now, however, it is generally for the mere purpose of going once more over the old allegations and proofs, with which ten years of discussion and iteration have made the public so familiar.

In the meantime, however, the men who lost their ships during the war, and to whom the *Alabama* case has, therefore, a personal as well as political interest, are getting old or beginning to die off, and, having been thoroughly familiarized by orators and newspapers with the nature and extent of their losses, and with the obligation which rests on England to make them good, and being constantly reminded that it is now the business of England to come forward at once with "the cash," and learning that England is ready to pay "the cash," some of them are not unnaturally anxious to get "the cash" in. But here the very newspapers which are most clamorous for "the cash" step in and say that the sufferers ought not to receive it except through the Government, and by virtue of an agreement with the Government. In this they are undoubtedly right. The owners of vessels destroyed by the *Alabama* have no direct claim on the British Government, and the losses they have suffered were also offences against the United States, the atonement for which it belongs to the United States to exact. But then there rests on the United States Government an obligation of the strongest kind, either to adjust and pay their claims at once itself, and then take its own time to exact reimbursement from Great Britain, or to push the settlement of their claims now with all convenient speed. It has no right to use the claims merely as weapons of offence, and, while making the world ring with accounts of the destruction of our commercial navy by English cruisers, treat the complaints of the owners of the navy as of no consequence. No prospect of advantage to the country at large through intentional delay in the negotiations will justify total indifference to the demands of the individuals whose losses really give our case most of its weight; for it is the extent of those losses which makes it worth while to hold England to a strict account. If the *Alabama* had sailed just as she did, but had afterwards done American commerce no injury, her sailing would certainly never have been made the subject of complaint against England.

Now, what are the causes of this unwillingness on the part of the Administration and of a portion of the press to define the satisfaction which Great Britain must give in order to close the *Alabama* controversy? They are two in number: one, which probably only actuates a comparatively small number of persons, is the desire of revenge. They expect that England will some day get involved in a European war, and that then the United States will have an opportunity of paying her off in her own coin; and we can tell the *Pall Mall Gazette* that nothing could please this class better, or serve its purposes better, than that fine old rule of international law, which it says is being revived in England, that the only obligation which rests on a neutral power with regard to the starting of war vessels from its ports, for the service of belligerents, is the obligation of submitting to their capture without complaint. If any power in the world has an interest in preventing the revival of any such rule, it is certainly England. With this class, however, there is little use in arguing. The impolicy of revenge, and the uselessness of nourishing revengeful feelings, and the essential barbarism of introducing revenge as a force into politics in our day, is too well known, and has been too often dwelt on, to leave any ground for the belief that those who take this view of the *Alabama* case do so through ignorance. We who believe that there are such things as principles in politics, and that they are not limited in their application to one country or one continent, have only one thing to say to these gentlemen, and that is to request them to refrain, for decency's sake, from openly preaching magnanimity and moderation and general utilitarianism to Bismarck and King William.

The second class consists of persons who hope that by holding out we shall get Canada eventually in satisfaction of the *Alabama* claims. In this class we believe we may include *Harper's Weekly* and Senator Trumbull. In mentioning these, we mention probably the two ablest and most respectable supporters of the scheme. Senator Trumbull has, in a recent speech in Chicago, set forth the undeniable advantages, political and economical, both to the United States and to Canada, of the annexation of the latter. In fact, it is something which anybody who knows anything of the circumstances of the two countries must wish to see brought about; but it is precisely because we wish to see it brought about, and that speedily, that we deprecate all advocacy of it on this side of the line in connection with, and especially as a penalty levied on England on account of, the *Alabama* case. It ought not to be necessary to point out to any man who has any familiarity with history, and has occupied himself with politics, that the cession of territory is regarded by all modern nations as a sign of defeat and humiliation. It is something to which no first-class power ever submits, except in exchange for something else, or as a terrible necessity imposed by irretrievable disaster in war. In the frantic resistance offered to it by the French, even in the throes of despair, we have a striking illustration of the horror with which it is regarded by the leading nations of Europe. With the feelings of the French about it, everybody who is capable of putting himself in other people's place—and anybody who is not ought to let politics, and especially foreign politics, alone—must sympathize. Now, Great Britain has not been defeated in war; she is, therefore, though willing enough to pay damages for the *Alabama* depredations, not prepared to submit to the payment of a penalty, and especially of a penalty so exceedingly humiliating as the surrender of territory. If Canada, therefore, be asked for as a penalty—that is, as something to appease an angry enemy without any reference to its pecuniary relation to the wrong for which it is expected to atone—it will of course at once bring into play the national pride and divers other worse passions, and then we may bid farewell for an indefinite period to all hope of a settlement of any kind.

There is one way in which the annexation of Canada to the United States might be made acceptable to England, and might be brought under that wise and just rule which *Harper's Weekly* applies to the cession of Alsace and Lorraine, but apparently does not see the force of on this continent, and that is, its being demanded by the Canadians themselves. We have not a particle of doubt that if the Canadians called for a severance of the few remaining bonds which unite them to Great Britain, their application would be received by nine-tenths of the English public with open or secret rejoicing, and at once be acceded to. But it is just as safe to say that annexation against which the Canadians protested, men of all parties in England, *and more particularly the English Radicals*, would feel bound in honor to resist to the death.

What the Canadian feeling is on the subject we do not pretend to be able to speak of with certainty. We know of no trustworthy evidence that any considerable portion of the people as yet desire annexation, though we believe there is plenty of evidence that the feeling in its favor is growing, and that, if politicians on this side of the line will only behave with discretion, it will yet bear fruit. But it would be difficult to contrive a better mode of making annexation hateful to the Canadian people than for us to talk of it as a punishment for the commission, by England, of wrongs with which the Canadians had absolutely nothing to do, and for which they are no more responsible than we here are for the condition of Ireland. Annexation, on such grounds and under such circumstances, would not only violate all the rules which some of its advocates are now, with curious inconsistency, urging against Bismarck with regard to Alsace and Lorraine, but of several others of which Alsace and Lorraine cannot claim the benefit, and the breach of which would bring the Canadians more surely to the level of cattle, or, recurring to the original application of the term, to that of "blackmail," than any people in modern times have ever been brought. Canada is not part of England in the sense that Alsace and Lorraine are parts of France, and a more monstrous violation of right could hardly be contrived than would be involved in fastening on her the responsibility for defects in English foreign policy.

The delay in framing and producing distinct grounds of settlement in this controversy, and urging them persistently on England, becomes more and more discreditable to the Government and the public the longer it lasts; and what a proper regard to the interests of individual sufferers, to the dignity of the United States, and the interests of civilization and justice, calls for, has been, we think, well set forth by Dr. Bluntschli, in the article of which we gave a summary a few weeks ago, namely, compensation for all damage done by cruisers sailing from English ports, and the issue of such a joint declaration touching neutral duties as shall not only attest the illegality of the past course of Great Britain in this war, but settle the law for the future.

THE "POOLING" OF RAILROAD RECEIPTS.

"We learn that the three lines which carry passengers between Chicago and Council Bluffs have made an agreement to pool the earnings on through business between these two places, and divide them equally." This modest little announcement, taken from a contemporary devoted to railway interests, is deserving of more than a passing notice. It marks, indeed, the entrance upon a new stage of railroad development; whether for better or worse, remains to be seen. "Where combination is possible, competition is impossible." This aphorism, long ago enunciated, we believe by the elder Stephenson, is receiving new confirmation in this process of "pooling."

The last summer witnessed probably the most severe railroad "war" ever maintained between the leading trunk lines of this continent. It is greatly to be hoped that the public profited by it, for the railroads certainly have; though their lesson has perhaps been rich rather in experience than in money. The "war" broke out early in the season, and, as all business men know, rates between competing points tumbled down lower and lower, until they absolutely touched the zero point. For weeks cattle were drawn over the Erie and Central roads at a dollar a car on one line, in competition with a cent a head on the other. Fares and freights fell 50, 60, and 70 per cent., while the corporations seemed sternly bent on ruining each other. Considering who were the managers, or, rather, it might more correctly be said, the practical owners, of one of the competing lines, it is deeply to be regretted that they did not fight it out to the bitter end. No such good fortune could, however, reasonably be anticipated. One day in August it was intimated that the officials of the three great trunk lines were in conference, and on the next day competition ceased. A new tariff was then announced, the increased rates of which ranged between one hundred per cent. on first-class freights in general and fifteen thousand per cent. (the rise being from $1 to $150 per car) on live stock in particular. The conferring managers, however, did not stop here; being together, and in the mood, they conferred to some purpose. Long experience had demonstrated both the folly of "cutting rates" and the certainty that rates under the existing system were sure periodically to be cut. The moment there is not a glut of business for all the lines, that one which is least busy attempts to underbid its competitors, and thus begins a "war." Some radical measure only could put a stop to this. "Pooling" receipts, as it is called, naturally suggested itself. This certainly went to the root of the difficulty. By virtue of this arrangement, all money received for business done by any road between points of competition was to be paid into a common fund, or "pool;" this sum was then subsequently to be divided in fixed proportions among the parties to the agreement. Such a plan certainly held out small inducements to "cutting." Any road indulging in the practice would have the privilege of doing all the work in order to divide the receipts. It would not improbably be allowed to wear itself out without remonstrance while thus earning dividends for other lines, which could afford in the meanwhile to lay their own cars up in ordinary. The arrangement involved, in fact, a practical consolidation of all the great East and West trunk lines, and the creation of a united interest which was to control in close alliance some 10,000 miles of track, and in the neighborhood of $600,000,000 of capital.

This certainly has an alarming sound. At the same time, we are not clear that, even for the public, the arrangement would not possess decided advantages. It would, in the first place, effectually dispose of the existing system of railroad competition, than which few things can be more mischievous. Stability—something which eliminates the gambling element and renders calculation possible—is the first essential of a sound business condition. What with paper money on the one side, and railroad competition on the other, it is not easy to see how any legitimate business has been conducted in this country during the last ten years; there have been about as many elements of chance in trade as would naturally be encountered at the faro table. Few people realize how largely unregulated competition has contributed to this result. For instance, two years ago buyers would not go to Boston because the competition in carriage was wholly to and from New York, and did not extend into New England. During the last six months it has been just the other way; Boston has been the focus of the sharpest competition, and merchandise has repeatedly left New York for the East in order to find the cheapest road to the West. So, again, of all points out of the line of competition. Certain railroad companies have, as a regular thing, carried goods a hundred or two miles further to a competing point for less than half of the amount they exacted for delivering the same article at the nearer point not touched by another road Such a system of extortion is, of course, ruinous to local enterprise. It destroys all equality in chances. Anything, therefore, which replaced this wretched attempt at a law of supply and demand by an equable, regulated, and permanent system, could not be wholly bad. The combination suggested would at least establish a certain sort of responsibility—not the best, perhaps, but still better than nothing. Under the present system, no one can be held to any account; one line "cuts," or extorts, because another does it; a locality is ruined to-day and enriched to-morrow, simply because two or three men, over whom it has no real control, see fit to quarrel or be friends. No one controls; there is no defined objective against which public opinion can be directed—no one, in a word, is responsible. Now, in this country public opinion is the one thing which is all-powerful. Once arouse it, once set it going in a given direction, and no man, or set of men—whether owning three million slaves, or ten thousand miles of railway, or three hundred millions of banking capital—can long stand against it. If you wish, therefore, to perpetuate abuses, the best way to do it in America is to divide responsibility. One man can be held responsible; one hundred scarcely; a thousand never. Thus, our executives are generally much purer than our legislatures; for the one man has to stand up before the people and answer for his acts, while the many hide themselves behind each other. So of our judiciary; where the executive appoints its members, more care is always exercised in selection than when the duty devolves upon a caucus. What governor ever would have put a Barnard or a McCunn upon the bench? Not improbably, then, it would prove far easier to produce beneficial results when acting on a recognized and responsible railroad combination, no matter how powerful or widely ramified, than on the disconnected members of an unorganized system, each one of whom disavows responsibility, and, indeed, disputes its existence.

While all this is true, it must at the same time be conceded that the power held by such a combination would be a very dangerous one; it would, in fact, have its fingers around the throat of our whole system of internal communication. It could exercise an influence over trade, and levy taxes in a manner scarcely within the power of the Government itself. The character of the individuals in whose hands such a control over our fortunes seems likely soon to centre, becomes, therefore, a matter of some interest. This aspect of the case, it must be confessed, is most uninviting. We do not like to resort to strong language, yet none other does justice to the occasion. Cornelius Vanderbilt, Jay Gould, and J. Edgar Thompson—here is, indeed, a trio in whose hands an enlightened people are invited to confide most delicate interests! The contemplation of them in this new capacity certainly puts a heavy strain on the confidence one entertains in the future. These men, however, actually do, and long have absolutely controlled all our great trunk lines. If the adage be true, that, when one class of the community falls out, another and more deserving class comes by its dues, we can only say that honest men must have been enjoying themselves very much during the recent railroad "war." Here they are, however—avaricious, unscrupulous, often dishonest, always unreliable—as discreditable a triumvirate as ever domineered over Rome; and the question is simply whether they can best be dealt with together or separately. We now incline to the opinion that the public could, on the whole, take them best together. Mr. Jay Gould and Mr. James Fisk, jr., have not hitherto been found very responsible parties; they have, however, been tolerated. They have made themselves popular through competition and reckless management; the public has felt that it could use them. Remove all this, and then see how long they would last. Let them appear as part of a responsible and oppressive triumvirate, let them levy taxes and regulate trade, let them then abuse their power and make our people really feel their presence, and let us see how long Governor Hoffman, or "Tammany" Tweed, or Judge Barnard, could preserve them in place. Perhaps they might still hold their own, and new "Erie bills" would guarantee them a quiet possession; perhaps Vanderbilt and Thompson would enjoy the share of odium and danger which their associates in power would force them to incur; perhaps the West would appreciate and share the quiet subserviency evinced in the East; all these things may happen, but, though Issachar be a strong ass, yet even his back may be broken, when made to crouch between *three* burdens, and he will be far more likely to kick if he clearly sees a particular tormentor at whom his iron hoofs may be directed with effect.

It is useless, however, to theorize about that concerning which we are destined so soon to have a practical experience. The "pooling" arrangement, as regards the trunk lines, fell through at the September conference. It did so from no objection entertained towards it in any quarter, but because one individual whose concurrence was essential insisted upon including personal issues in the general settlement. It is delayed, not abandoned. The preliminary experiment of the system may be considered as now going on in the combination referred to at the beginning of this article. All the parties involved in this case are concerned in the other, and combination is now fairly on its trial as a substitute for competition. One thing may safely be predicted. This, at last, must inevitably carry the railroad and transportation problem to Washington. Congress must regulate commerce between the States, or it must go unregulated. A body more utterly unqualified for such a delicate task could hardly be conceived; but upon it the work must perforce devolve. The inevitable may not be avoided; but a future, big with the result of an attempt on the part of the United States Congress to regulate and control our railroad triumvirs, is to the philosophic mind the reverse of assuring.

OUR MINISTER TO FRANCE.*

BERLIN, October 7.

THERE being no interesting news from the seat of war during the last week, the two reports of the negotiations between Bismarck and Jules Favre, published by the parties themselves, have formed the principal topic of political importance. The present French rulers stick to their illusions, while Bismarck occupies a very clear, matter-of-fact position, which appears all the more logical and refreshing in contrast with the dim clouds of French fine phrases, theatrical sentimentalism, and special pleadings. As these negotiations, undertaken on one part without any authority, did not lead to a practical result, it is not worth the while to dwell on them more particularly; but there is one point in them to which I wish to call your special attention. Favre says in his report that the representative of a great foreign power did not wait until the Provisional Government was set up, and that, for the purpose of entering into relations with it, that representative hurried to its cradle at the Hôtel de Ville. Favre adds that official discretion prevents him from disclosing the name of that gentleman; but his highfalutin expressions, and other facts since published, prove distinctly that the French politician alludes to your minister, E. B. Washburne.

I am quite at a loss how to characterize his conduct in this instance. Your Government is a neutral one; it is its wise and time-honored policy never to meddle with European difficulties, whenever it can help it, and it is its interest and duty to acknowledge any *de facto* government. If Mr. Washburne had done so after having received his instructions from Washington, he would have acted in conformity with his country's principles. Mr. Fish is quite punctilious in maintaining the neutrality of the United States; but his minister sees fit to go into the streets and to search for the new government to which he can offer his homage. It seems as if Mr. Washburne had wished to make his former position at the Imperial Court forgotten by his present zeal for a republic created by the grace of German bravery and the rabble of the streets, as sober Frenchmen like Thiers and Laboulaye themselves acknowledge. While Napoleon was Emperor, Mr. Washburne was one of his foremost admirers and staunchest friends; he even received invitations to Compiègne, which were usually only extended to full ambassadors, not to ministers; and now Mr. Washburne is most eager to win the good graces of a provisional government. He may say for his excuse that, as a diplomatist, he does not need to be, and cannot be, consistent; that the interests of his country outstrip his personal views and wishes; but, generally, people think that it is the first duty of a minister to preserve the dignity, respect, and credit of his government. Whether he has succeeded in this I leave to your readers to judge. As able and useful a public man as Mr. Washburne may have been in Washington, he is entirely unfit for a position for which he lacks the elementary rudiments, having no idea of the language, history, and character of the country to which he is accredited. Therefore, he shows an utter inability to appreciate stern fact and naked reality. It may do for newspapers, speculating on the irregular appetites of their readers, to extol a government, whatever may be its spirit, because it has assumed a republican form; it may be pardonable for a stump-speaker to appeal to the republican sympathies of his hearers, by glorifying as great men and noble souls the remaining partners and-successors of a bankrupt concern; but a good minister never confounds the appearance of things with their essence. If the republican form alone were sufficient to support a government, the Southern States in their rebellion would rather have deserved the admiration of Europe, as Jefferson Davis's constitution had many features which were an improvement on the old model.

Here, all thinking men are surprised at Mr. Washburne's simple forwardness, for they supposed that, as a veteran practical republican, he would know how to distinguish between reality and pretence. There was a significant notice the other day in the London *Times*, stating that General Burnside had left the Prussian headquarters at Versailles for Paris, to confer with Jules Favre and the American Minister. Bismarck has for some time taken it amiss that Mr. Washburne was so rash in entering into relations with the present French rulers, and that he remained in the besieged fortress while almost all other foreign ministers had followed the Government to Tours. The answer which Bismarck lately gave to Favre's wish for free diplomatic intercourse with Paris was directly aimed at Mr. Washburne. General Burnside, it is understood, has been requested to recommend to his countryman to keep himself in future within the boundaries of strict neutrality. The negotiations with France are only the pretext for the mission; the Prussians can and will better attend to that themselves. If no complications of a more serious character arise out of Mr. Washburne's conduct, it is owing to the friendly relations which the Prussian Government wishes to maintain with the United States.

---

* [This letter has been delayed a fortnight, but has lost nothing in interest in consequence.—ED. NATION.]

If Mr. Washburne had wished to exert himself in a neutral field, he would have found ample occasion for doing so in the protection of those poor 80,000 Germans who were brutally driven out of France for no other reason than that they belonged to the nation which had been provoked to this war. He had seen in his own country the cruelties which, from 1861 to 1865, the rebels committed against loyal Northern men visiting in the South, and, consequently, knew by experience what heart-rending distress, misery, and starvation attended these expulsions in masses. In the present case, a neutral could help and benefit thousands of innocent families. There was even no actual intervention required; the energetic protest of the representative of the United States would have sufficed for a discontinuance of these mean French practices; and, even if the Empire had insisted upon them, the acknowledgment of the Republic under the express proviso that it should stop this mediæval barbarity would, as we have learned since, have had the desired effect. But Mr. Washburne wrote home for instructions, and, instead of interpreting them liberally, as he did in the case of the so-called Republic, he pedantically adhered to the letter, and washed his hands of his German clients. Writing home instead of acting at once was his great blunder.

Some of your readers may say that the American Minister had nothing to do with helpless Germans. Certainly not, if he had not charged himself with their protection. But having accepted the trust, the best interests of his own country were at stake. I know something about the currents of popular feelings, about national sympathies and idiosyncrasies, and for this reason I do not hesitate to say that Mr. Washburne's efforts in behalf of the Germans would have secured to the United States at least 100,000 more immigrants, and that the moral effect of an earnest appeal would have been invaluable. In ciphers and numbers, I value the loss of Mr. Washburne's sin of omission for your country at one hundred millions of dollars, while the moral damage is incalculable. In the life and intercourse of nations, moral powers are of as much importance, if not more, than the physical. Immigrants are just as much attracted by the republic, the *free country*, as by its fertile and cheap lands and its high prices of labor—perhaps more so. Each event which increases the consideration of the United States in the eyes of mankind is at the same time a great economical gain for the wealth of the nation. You hardly remember the release of the Hungarian Koszta, effected in 1853 by the threats of Captain Ingraham. I remember it very well, for I was a poor immigrant myself at that time, and I still feel the thrill of joy and enthusiasm which electrified all your adopted citizens. This simple act of a South Carolinian marine officer did more to make your country popular all over the world, and to attract immigration, than the combined efforts of States, governors, private associations, and emigrant-runners. The old Democratic party knew how to manage this moral propaganda and to keep up appearances much better. The more it submitted itself to the slave-barons at home, the more independent and liberal it appeared abroad. The Republicans should act for the sake of principle, and should thus win the sympathies of the liberals of all nations. It is their interest and duty to do it; but Mr. Washburne shows that one of the principal leaders of the party does not understand or appreciate either. M. Girardin, however, praises him, and M. Girardin professes to be a republican—the same man who, in full earnest, proposed to let loose the famished beasts of the zoölogical gardens of Paris against our armies. To be called a great statesman by such a genius is an honor of rather a doubtful character.

Friedrich Kapp.

Correspondence.

A STEP IN ADVANCE.

To the Editor of The Nation:

Sir: I am quite at a loss to understand the significance of the two notes to yourself which you were pleased to append to my last communication. The allusions they both contain to "a poor author" are beyond my comprehension. I suppose they have reference to some previous episode in the career of the *Nation* with which I am not familiar. I certainly am not an author myself, nor have I any brother in that vocation. I am a simple professional man, with more time than occupation; with strong philanthropic tendencies, and a natural aptitude for the discussion of social and political problems. So much for myself, which will interest no one. I now pass to a more serious subject. Your correspondents seem to impute a degree of bad faith to my first letter. I am simply amazed. If there is one characteristic of our rich American humor more commendable than another, it is its honest freedom from deceit. Take Billings, Nasby, and the rest who do our national taste such infinite credit—they instinctively recognize the dislike their countrymen have for all such frauds as your correspondents coolly attribute to me, and when they deal with irony or ridicule they call attention to the fact by saying, "This is writ sarcastic," or "This is sarkasm," or words of like effect. This is honest. Your correspondents impute to me a base fraud, and you, sir, owe me an apology for printing their letters. When I deal in scoff and sneer, I, too, shall spell badly, and put up a sign-board to give notice of the fact.

One thing, however, is evident: I am carrying the war into Africa—preaching a gospel to the heathen. The "Phillips philosophy" will yet, through me, secure a footing even among the sceptics who seek nutriment from the *Nation*. Like my great leader himself, I too can submit to your editorial carping and to the incredulity of your correspondents, provided I feel that the good work goes on. I was grieved, however, to see that I had, through my first letter, indirectly occasioned pain to Mr. Phillips. Your brutal comments on that communication he referred to, in his speech of the 3d inst. in Boston, in these grandly Christian words: "I have tried all my life to discuss systems. A New York paper laughed at me for being philosophical. I suppose I am not, but I try at least to be above heads. I have been dragged down lately a great deal." Can you, sir, read this reproof, in all its gentle, patient humility—the love of brother-man breathing through every word—and not feel a pang of remorse? If you can, I do not envy you. For myself, I am made happy by the belief that he has since seen my vindication of him in your issue of last week.

Let me pass on. This last speech of Mr. Phillips, I do not hesitate to say, has elevated him, if that were possible, even in my opinion. Perhaps a little vanity mingles with my admiration, for Mr. Phillips now leaves the moral atmosphere in which he has nor peer nor second, and descends unto that material ground on which I feel that I have trod before. He devotes a large share of his remarks to the relation of capital to labor, and states principles not usually found in ordinary treatises, in the pure, crisp English of the platform. He bases himself on this eternal truth, never heretofore so distinctly stated:

> "What makes New England different from Old England and our civilization different from European civilization is, that when the working-man has paid his grocer and his rent on Saturday night, he has got a dollar left in his own hand. That dollar means that he is an independent man. It is a spring-board by which a class lifts itself to a better level. The capital that threatens that it will raise a million dollars and import 100,000 Chinese means to take away that dollar. Mark me, I don't mean to say that it has not a legal right to take that dollar away: I only say that, considered from the standpoint of civilization and Christianity and progress, the class of capitalists that undertake to take it away are doing perilous service to the state."

Standing upon this truth, Mr. Phillips need not fear Dr. Whately himself in arms; his head is right on the glowing heart of the people. At the same time, irrefutable as the proposition is, so far as it goes, Mr. Phillips still betrays the fact that he is new to the study of this class of questions. He either does not clearly see as yet, or he is timid; we miss the giant stride with which he wades through the moral world. Presumptuous as it may seem, I propose here to walk in advance of the great leader. In the passage quoted, Wendell Phillips told but half the truth. He never should have limited his proposition to the Asiatic. It is equally true of Celt and Teuton. But these—and here notice the nice use of language—capital does not "combine" to "import;" they came as our fathers came, and as the Chinaman is free to come if he sees fit. The point is well taken. It is the combination of capital which threatens to or does import degraded labor; this is what is wrong. It is wrong; but why limit it to man? Will Wendell Phillips falter and stop here? Not if I know the man!

A short time since I visited the large mills of the Merrimack Manufacturing Company, at Lowell, in company with my friend, its superintendent. In one large hall I saw many busy girls at work earning a hard support. Presently I came to one corner of the room where stood a new machine, just imported from abroad, by means of which two men could do the work of fifty of those girls. The superintendent told me that he proposed to import other similar machines and thus reduce his hands. In the name of New England labor, I protested on the spot! Capital combining to import machines from England to do work now done by American hands! Where was "the Saturday dollar"? My friend at once saw the point, and hung his head—for he is a humane man—but told me that the capitalists who employed him, in an unbridled lust of gain, insisted on the change. In the name of logic and consistency, I call on Wendell Phillips to join with me in holding up to public execration the Merrimack Manufacturing Company and all those similar combinations of capital which threaten, through the importation of improved machinery, to take "the Saturday dollar" from any American hand. "The class of capitalists that undertake to do it are doing perilous service to the state." Talk of a few Coolies—"heathen Chinee"—one such machine as I saw at Lowell will do the work of a thousand of them and not cost so much as ten. If "the dollar" is taken, what matters it to labor whether the machine takes it or the Chinaman? Here is the evil deep down under ground, and our mentor but scratches at the surface.

No! We of the advanced school—the philanthropist friends of labor—must take new ground. Labor must be protected; capital must not combine to displace it. That machinery which enables one man to do the work of many which is here, is sacred; it is property, and we wage no war on that. But for the future, taking the ground we have in regard to the Chinese, a decent respect for consistency must exact of us, even if philanthropy did not, a stern resolve to denounce and resist every combination of capital which threatens to import labor, or the equivalent of labor, within the limits of Massachusetts. We have had enough of labor-saving machines, whether made of flesh and blood or of catgut and iron; all importers and all domestic inventors of such are doing "perilous service to the state."

On this platform do I place myself, and Wendell Phillips is pledged to stand by my side. He never yet has failed to walk up to the logic of his convictions, nor will he now. A Sentimentalist.

Boston, November 5, 1870.

[The omission here of all mention of the Chinaman's "natural right" to go where he pleases and earn an honest living, is dishonest, but characteristic of the school. We have received a most absurd letter from another Sentimentalist, demanding "belligerent rights" for Mrs. Julia Ward Howe in her war against Bismarck. We are unable to spare space for it; but we must remind its author that Mrs. Howe has no army, no fleet, no ports, no prize courts, and has as yet given no such evidence of her ability to protract the struggle on which she has entered as would justify our Government in recognizing her as a party to a *justum bellum*. Should Bismarck, however, prove unable to subdue her by next summer, we think a declaration of neutrality on the part of the United States would perhaps be justifiable.—Ed. Nation.]

Notes.

LITERARY.

We are informed that the University of Michigan has secured the library of Prof. Rau, of Heidelberg, a telegram from Ann Arbor having anticipated, by one day, a similar telegram from Yale College.

—A private letter lately received from Prof. Marsh, who is now in California, states that the recent unfavorable comments of several newspapers on the action of the Yale College scientific party in obtaining some Sioux skulls are entirely unwarranted by the facts. The few collected had been exposed to the weather for years, and some of them, at least, had been much mutilated by wild animals. In rescuing them from further destruction for the benefit of science, the Yale party merely did what every naturalist would have done under the circumstances.

—A writer in the Oneida *Circular* has taken the pains to collect from the catalogues of New England colleges the names of families that have graduated to the number of twenty or more. The list contains one hundred and fifty-nine such names, representing a large share of the intellect of the country, but it of course omits names quite as distinguished as any that it embraces. We have selected out of it the following names as being known to our national literature, either directly as authors or as speakers or writers for the press. A comparison of the whole list with Allibone would doubtless oblige us to include many others:

Adams, Allen, Andrews; Baker, Baldwin, Bartlett, Bigelow; Chapin, Clark, Cleveland, Cook and Cooke, Crosby, Curtis: Dana, Davis, Day, Dickinson, Dwight [all the Ds]; Emerson, Everett; Fisher, Fiske; Gould [the conjunction is purely accidental]; Hale, Hill, Holmes, Howe, Huntington; Jackson; Lee, Lord, Loring; Marsh, Mason, Mills, Mitchell, Morse; Nichols, Norton, Noyes [all the Ns]; Osgood; Paine, Parker, Parsons, Perkins, Perry, Phelps, Phillips, Pierce, Porter, Potter, Prentice, Putnam; Read, Ripley, Robinson, Russell; Sargent, Savage, Shaw, Smith, Spaulding, Stearns, Stevens, Stone, Storrs; Taylor; Walker, Webster, Wheeler, Whiting, Whitman, Whitney, Wilson, Winthrop, Woodbridge, Woodward, and Wright.

Of these the most numerous graduates rejoice in the name of Smith, and are reckoned at 214. The Adamses come next with 115, followed by the Clarks with 96, and the Allens with 82.

—The October number of the *Methodist Quarterly Review* contains a suggestive article by Prof. Wheeler, of the Northwestern University (Evanston, Ill.), entitled "Our Spoken English." It starts from Mr. Marsh's hint as to "the strain put upon the English language in this country by the use of the literary dialect for all purposes, by all sorts of people," and treats this topic mainly on the side of phonetic corruption in the language as spoken. The principal point made is that there is a marked tendency in our community to develop "a spoken English departing widely from its *orthographical* brother"—a tendency which shows itself chiefly in the attenuation of sounds. We all recognize, in his words, that "American elocution is less round and full-volumed than English." This fact he attributes partly to the climate, partly to the influence of colloquial forms and usages, which in any other country would remain pure colloquialisms or dialectic peculiarities, while we carry them at once into our literary speech. Evidently this cannot be avoided in a country in which the language of literature is used in daily life; if, therefore, these attenuating influences are powerfully at work, without adequate counteracting influences, the result must be as he indicates. Instances cited of this tendency are such expressions as "*I'd'now*" for "*I do not know;*" the identity in sound of *accept* and *except;* the loss of the European *r;* and the consigning all unaccented medial and final vowels "to the limbo of a universal *u*." The author fairly states the counteracting tendencies, and leaves it undecided whether these will in the end prove stronger than the others. It seems to us, however, that he fails to do full justice to the working of our common-school system in this direction. This elaborate system, with its normal schools and teachers' associations, works very powerfully in cultivating an excessive and oftentimes unpleasant preciseness in articulation—falling in in this respect with that national habit which gives us tō, pŭt, of*t*en, Wor*ces*ter, and Nor*w*ich. Mr. Marsh, indeed, in his lecture on "The English Language in America," holds that the Americans articulate more distinctly than the English, for the very reason that they are a reading people. Mr. Wheeler, too, calls attention to the fact that the English language in itself is marked by "increasing laxity in the pronunciation of the unaccented syllables, accompanied by an increase of accentual stress," the result of which is that "sputtering out one half the word, and swallowing the other," which Mr. Marsh speaks of. The special American defect seems to be not carelessness, but dulness of articulation—the contrast which Mr. Lowell points out "between the rifle-crack of an Englishman's *yes* and *no*, and the web-foot drawl of the same monosyllables in the mouths of my countrymen." This is no doubt largely due to climate; but it could, we believe, be largely remedied by careful training. If our elocutionists, instead of inculcating, with infinite pains, artificial systems which the pupil will be at no less pains to forget as soon as he sees what he needs in real life, would only teach him how to use his lips and teeth, they would do real good; as it is, they are generally useless, or worse.

—The "Rev. Mr. Pickering, of Squashville," whom Mr. W. W. Phelps so violently assailed at the last commencement at Yale for persisting in retaining his place in the corporation of the College, has published a very pungent reply in the last number of the *New Englander*, which certainly shows that, however ill-fitted the reverend gentleman may be to manage a university, he is no mean dialectician. "Mr. Pickering" says that Young Yale's charges, that the college "wants living connection" with the world without, is not true; that the professors have as much connection with "the world without," through their various social relations, as anybody out of Wall Street; that Young Yale's plans for pushing the college, such as getting celebrated persons to attend commencement dinners, and distinguished poets and historians to fill professorships, in so far as they are not snobbish, are futile, and have a savor of dry-goods "drumming;" then coming down on the two "Alumni" who have appeared for Young Yale in the *Nation*, and one of whom assailed the clergy as a class in an impudent and indecent manner, he castigates them severely. He says the clergy, *as a class*, will compare favorably with any other class in point of ability and attainments; that success in money-getting is not a test of ability; that the education of ministers is more thorough than that of other professions; and that their special studies rank higher than other studies. He alleges, moreover, that, according to Young Yale's own admission, the professional chairs are admirably filled, the college funds have been for 170 years admirably managed, and that better things than these Young Yale could not do; and he insinuates that, if it had its way, it would manage the college on a sensational plan, as "Mr. Barnum manages his museum, or Mr. Bowen his *Independent*." "Mr. Pickering," however, reserves his strongest argument of all for the close, and it is the only one which admits of absolutely no reply, and that is, that however much Young Yale may wish the ministers to turn out and let the Alumni in, the ministers will not do it, and that there is no power on earth, as long as the Constitution of the United States stands, competent to make them do it. The reverend gentleman here limbers up, but not before firing a parting shot at the retiring foe, in the shape of a suggestion that it would not be a bad thing if some of the reformers would make up a university fund of half-a-million dollars, present it to the college for general purposes, and elect trustees from among the Alumni to manage it. His medium of communication with the public is, we believe, Dr. Bacon.

—A correspondent in California, who is abundantly qualified to instruct us on the subject, says of our recent complaint in regard to telegraphic facilities, that "in general what the *Nation* says ought to be done is done, and has been done for years. Messages are constantly being received by mail at our office to be forwarded by telegraph (notably in the case of Idaho and China business), and as regularly enjoy the benefit of the mail on the way to their destination." We shall take the liberty of judging from our own case, however, that this fact is not so widely known as it deserves to be; and we believe the telegraph companies seldom get credit for the laudable attention to the interests of the public which is vouched for in the following further extract from our correspondent's letter: "Finally, when the party sending the message *makes no request* to have it mailed, and when the person addressed cannot be found, the delivery-office not only notifies the sending-office of the fact, but, in addition to this, *mails* a notice to the person sought, stating that a message is waiting for him at the telegraph office."

—At the recent meeting of the American Oriental Society in New Haven, full-size photographs, the gift of the Palestine Exploration Fund Society, were exhibited of the impressions taken in soft paper from the famous Moabite stone lately discovered; and these were supplemented by plaster casts of some of the smaller fragments. President Woolsey exhibited a photograph of a commemorative monument of the best period and highest style of Greek art, exhumed at Athens last year. Impressions of a Sanskrit inscription of the fifteenth century, found on a column in the Buddhist temple at Peking, were exhibited by Mr. Taintor, who described another, still older, that he had seen in another part of the country. A series of unpublished letters of Sir William Jones to the early Sanskrit scholar, Charles Wilkins, were sent in by Prof. Fitz-Edward Hale, of London, and are valuable as showing the beginnings of the study of Sanskrit by Europeans. Among the other communications of most interest were reviews: by Prof. Hadley, of the first part of Westphal's new Greek Grammar, and by Prof. Whitney, of Cox's "Mythology of the Aryan Nations"—both unfavorable; and Prof. Packard's discussion of the proper mode of pronouncing Greek, his own view coinciding with that of Prof. Sophocles, who recommends the nearest practicable approach to the pronunciation of the ancient Greeks. The German Orientals celebrated on the 2d day of October the twenty-fifth anniversary of their society, and bestowed gold medals on its founders, Professors Fleischer, Pott, Brockhaus, and Rödiger, who also received on the same occasion orders of high degree from the Emperors of Austria and of Russia.

—Our recent announcements of English publications require to be extended to almost an equal length, and the addition will scarcely be thought inferior in quality to the first collection. The war on the Continent has not had the anticipated effect of rendering publishers cautious—it probably broke out too late for that—though the movement of the book-trade is as low as it has been at any time during the past three years of dull business. Among works either in press or just issued we select the following: Of travel and adventure: "Autobiography of an Indian Officer," by Major H. M. Conran; "Honduras, Descriptive, Historical, and Statistical," by Mr. E. G. Squier, of this city (published by Trübner); the Marquis de Beauvoir's "Voyage round the World;" an old story revived in "Some Account of the Mutineers of the *Bounty*, and their Descendants," with illustrations by Lady Belcher; "The Travels of Marco Polo," Col. Yule's new English version, which we have already announced, and which will be accompanied by original maps and other illustrations (John Murray); "Wild Men and Wild Beasts—Adventures in Camp and Jungle," by Lieut.-Col. Gordon Cumming; "A Hunter's Adventures in the Far West," by Parker Gillmore, better known under his *nom de plume* of "Ubique;" "After Ophir—Adventures in Search of the Gold-Fields of Eastern Africa," by Capt. A. F. Lindley, containing some sixty engravings; "A New Sea and an Old Land," being papers suggested by a visit to Egypt at the end of 1869, by W. G. Hamley, Colonel in the Corps of Royal Engineers; a work of the highest interest, which we shall owe to the Palestine Exploration Fund Society, viz., "The Recovery of Jerusalem—an Account of the Recent Excavations and Discoveries in the Holy City," by Captain Warren, R.E., and Captain Wilson, R.E., with fifty illustrations, and an introduction by Dean Stanley; and, finally, "Travels in the Air—a Popular Account of Balloon Voyages and Ventures, with Recent Attempts to Accomplish the Navigation of the Air," by J. Glaisher, of the Royal Observatory, Greenwich. It might almost be said that if the siege of Paris could suggest the yet undiscovered mode of aerial locomotion on certain principles, it would be remembered as a blessing to mankind rather than as a misfortune to France.

—In biography, let us begin with David Macrae's "Life of Napoleon the Third," which it is still far too soon to attempt to write, unless, as in this case, to be sold for a shilling; "A Biographical Dictionary of the Judges of England," by Edward Foss, F.S.A.; "The Correspondence of the late Earl of Elgin;" "Lord Byron, a Condensed Biography, with a Critical Essay on Byron's Place in Literature," by Carl Elze; "A Bible Dictionary of Biography, History, Antiquities, Geography," etc., by Rev. Charles Boutell; "The Memoirs of Alexandra Feodorowna, late Empress of Russia," from the German of A. Th. von Grimm, by Lady Wallace, in two volumes; and the following, all in Mr. Bentley's list: "The Life of Viscount Palmerston," by Sir Henry Lytton Bulwer; "The Life of Richard Harris Barham," the famous author of the "Ingoldsby Legends," by his son, Rev. R. H. Dalton Barham; "London: its Celebrated Characters and Places," from 1413 to 1869, by J. Heneage Jesse; "Confidential Letters of the Right Hon. William Wickham to the British Government, from 1794," by his grandson, bearing the same name.

—The most noticeable scientific works are these: "On the Etiology and Prevalence of Diseases of the Heart among Soldiers," a prize essay by Arthur B. R. Myers; "The Descent of Man, and on Selection in Relation to Sex," with illustrations, by Mr. Darwin; "The Student's Elements of Geology," by Sir Charles Lyell, which ought to prove a very useful manual; "Primitive Culture," by E. B. Taylor; "The Longevity of Man, its Facts and its Fictions," by W. J. Thoms; "The Mollusca of the European Seas," by J. Gwyn Jeffreys, F.R.S., in continuation of his "British Conchology;" "The Transformation of Insect Life," from the French of Émile Blanchard, profusely illustrated (Cassell, Petter & Galpin); "A Dictionary of Sciences," by J. Farrer Rodwell and staff. The long-looked-for work on "The Talmud," by Emanuel Deutsch, is the leading theological publication; and we are to have, besides, Dean Milman's "Essays contributed to the *Quarterly Review*;" "The Revolt of the Protestants in the Cevennes," by Mrs. Bray; "Letters of Spiritual Counsel and Guidance," by the late Rev. John Keble, together with his "Miscellaneous Poems," and the third revised edition of his "Memoir," by Coleridge; a new translation of Bede's "Ecclesiastical History," by Rev. L. Gidley. The following will also bear grouping: "The Schools of Painting in North Italy," by Messrs. Crowe and Cavalcaselle; "Titian Portraits," being seventeen photographic reproductions of rare engravings after Titian in the British Museum; "Mountains and Lakes of Switzerland and Italy," in chromo-lithograph from sixty-four original sketches by C. C. Pyne, with a map of routes, etc.; "The Art of Sketching from Nature in Water-Colors," by Prof. P. H. Delamotte, with chromo-lithographic illustrations; similar sketches to accompany "The Riviera, from Cannes to Genoa," by the Dean of Canterbury; and "Pictures from English Literature," the text by Dr. Waller, and full-page illustrations by the most eminent artists in the kingdom.

—The English tax on journalism known as the newspaper stamp, which was abolished on the 30th of September, had outlasted more than five generations of men. The original act was passed in June, 1712, in obedience to a message from Queen Anne, who was disturbed by the seditious publications of the time. From fear of popular opposition, it was tacked on to a bill taxing soaps, parchment, linens, silks, calicoes, etc. It continued in effect for thirty-two years, and from the beginning was the cause of the untimely death of numerous newspapers. From one penny the duty was advanced by Lord North, in May, 1776, to three half-pence; in August, 1789, it was raised to twopence; in 1794, to twopence half-penny; in May, 1797, to threepence half-penny; and in 1815, to fourpence, which it never exceeded. In the reign of William IV., Sept., 1836, the duty was at one stroke reduced to a penny, and thus was inaugurated the era of cheap journalism. In 1855, the compulsory use of the stamp was abolished except for transmission through the mails; and, finally, at the last session, Parliament repealed the Stamp Act altogether. Some one will, perhaps, hereafter undertake to trace the effect of this act on popular intelligence as well as on the institutions of Great Britain.

—A writer in the *Evening Post* of October 19, who signs himself "Americus," has something worth saying on the subject of plebiscita. He says it, of course, apropos of the annexation of Alsace and Lorraine as a result of conquest, and in reply to those, among whom may now be reckoned Senator Sumner, who think the annexation would be quite unjustifiable without first obtaining the consent of the inhabitants—in other words, without taking a general vote or *plébiscite*. The French form of the word, the writer implies, is the true one, inasmuch as this sort of vote is a French invention, and indeed is the peculiar device of the Bonapartes. In its essence, it is a political instrument, designed to give a show of popular sanction where there is no real freedom of expression. For this purpose it is taken simply by yes and no, without previous debate or public meetings, and sometimes with a rider attached, like the clause to sustain the dynasty in the last *plébiscite*. The whole official administration is employed to secure a majority for the Government, the value of which, as a test of public sentiment, when had, is shown by the immediate collapse of the Second Empire after it had just been overwhelmingly vindicated at the polls. The *plébiscite*, in short, is a badge of conquest, and must necessarily be so, in Alsace as in Savoy and Nice, and still later in the Roman territory. Finally, to the theory of the *plébiscite* "Americus" objects that the right of the majority to vote away the allegiance or independence of the minority, much less of posterity, cannot be established by argument. The United States, he continues, of all countries, is debarred from reproaching Prussia for refusing a *plébiscite*. Texas is not a case in point, as it was considered an independent state before annexation. But California was got by conquest out of Mexico, and without thought of a popular vote to confirm it; New Mexico was merely bought in, without regard to the wishes of the inhabitants; and above all, Louisiana was purchased outright, on grounds of national expediency, but by extra-constitutional power, without asking the late citizens of the French Republic whether they preferred to make the exchange of rulers. The same was true of Florida when acquired from Spain. As to the dishonor involved in the cession of territory, "other people besides the French," concludes the writer, "possess the feeling of honor, but they have never been asked concerning that point by the French."

FACTS.*

WE doubt much whether it would be possible to introduce into schools and colleges a more useful exercise than the writing of compositions with the view simply of making the distinction between fact and inference, a distinction which even very young boys and girls are capable of making, and which may readily be impressed on the mind of those who have neither the time nor the inclination to study logic. It would give a kind of training, too, which few, even graduates of universities, get now, except those who go into lawyers' offices and learn to draw pleadings—and, it is safe to say, the want of which has a great deal to do with the rise and spread of most of the fallacies and delusions which appear in the discussion of the various social and political questions of the day, and which in a country like this form the main difficulty in the way of good government. Hardly any Sentimentalist, for example, has the least idea of what a fact is, and of the difference there is between facts and his own assumptions; or, if you listen to his speeches and read his articles, you will find that he mingles the two things together as if they were, if not identical, equivalent. He often talks on for hours proposing plans of reform which rest on nothing but notions of his own, which he really believes to be facts. We pointed out two years ago some striking examples of this in Mr. Parton's denunciations of alcohol and tobacco, as where he says: "The main *fact* that this admirable person (Goethe) lived always unpolluted by this seductive poison, is a *fact* of some significance; but the important *fact* is that he *could* not have smoked and remained Goethe." Now, it *is* a fact that Goethe did not smoke, or, to express it in the Parton dialect, "lived always unpolluted by this seductive poison;" but "that he *could* not have smoked and remained Goethe" is not only not an important fact, but is not a fact at all; it is simply an assumption of Mr. Parton's, based on his general hostility to tobacco. To his mind, however, the fact and the assumption were of exactly equal value. So also, after mentioning that Jefferson never smoked, which is a fact, he goes on to say: "There is no trace of the pipe in the writings of Washington and Franklin—*probably* they *never* smoked; *so that* we may rank the three great men of America, Washington, Franklin, and Jefferson, among the exempts." Now, here he assumes that smoking produces a certain influence on men's writings—that he can detect it on reading their writings—and that there is no trace of it in the writings of Washington and Franklin; and each of these three assumptions he evidently considers facts, and draws his conclusions accordingly. We might multiply these illustrations indefinitely, and we recommend any young man who wants to acquire habits of correct thinking and writing to take up as a useful exercise any of the articles or speeches of the school of social philosophers to which Mr. Parton belongs, and go through them, separating the real facts from the facts which are only guesses or inferences. He will often find the work not only very useful, but very amusing.

The book before us, though intended for lawyers, may be read with great profit by laymen, because it treats of facts as they have to be submitted to and weighed by jurymen—that is, by the average man of the community; and, in view of their aspirations, we also cordially commend it to the diligent perusal of the readers and supporters of the *Revolution* and *Woman's Journal*. It must be remembered, however, that no work which treats of facts from the Anglo-American lawyer's point of view can be considered, or is intended to be, a complete treatise on evidence, because, under our system of jurisprudence, the whole of the evidence regarding any transaction is never submitted to a jury, inasmuch as jurymen are not supposed to be capable of assigning their due value to any facts which have only a remote or indirect bearing on the case. What we call "the rules of evidence," therefore, are rules framed so as to shut out from the juryman's view all circumstances connected with the case, for the proper arrangement or weighing of which his training or mental capacity is deemed insufficient. In short, the law treats him not as a logician or skilled generalizer, but as a plain, blunt man, whose powers are very good as far as they go, but who cannot safely be burdened with many details. On the Continent of Europe, on the other hand, and in all countries in which the civil law prevails, everything that has been heard or seen about or connected with the case, is brought together with the greatest diligence, and piled up in a heap before the judge, who is supposed to be capable of picking out the truth from the mass.

When we come, however, to enquire what forms the basis of our rules of evidence for legal purposes, we find it is always a consideration of the various qualities of human nature, including its physical senses, its mental powers, and the moral weaknesses. In other words, when we come to examine the nature of any transaction of which we have had no personal knowledge, the very first thing we find ourselves called upon to do—except in cases resting on documentary proof—is to consider the goodness of somebody's sight or hearing, or his powers of observation, or his memory, or the strength of his moral principle; and if we do not know much about the man himself, we carefully collect our knowledge of other men and of ourselves, and, by the aid of the standard which we thus unconsciously frame, proceed to draw our conclusions as to the value of his story. Mr. Ram's book, therefore, though in name a law-book, is really a treatise on "the average man," and especially on the defects of the average man, for in weighing evidence these are the important things. For instance, as regards perception, we consider what are the things which are likely to deceive or confuse it; as regards memory, what circumstances, whether moral, or physical, or mental, or social, are likely to render it imperfect; as regards recognition, what are the conditions which make it difficult and untrustworthy. In like manner, in treating of length of time, of speed, or of distance, we are in reality always considering simply the witness's estimate of them; and here again the question becomes one of his capacity to judge of them and remember them. If a member of Moltke's staff told us that he saw ten thousand men defile past a certain point in a certain length of time, we should attach a very different value to the story coming from him and from a German peasant, although we might have the utmost confidence in the peasant's truthfulness. The question of the credibility of a witness, too, is largely one of character; but even after we have satisfied ourselves as to the man's character, we are still in doubt about his narrating power. He may mean to tell the exact truth and nothing but the truth, and yet defective power of expression, or nervousness, or inability to arrange facts in his mind, may make his story an utterly unreliable hodge-podge; or his imagination may have been so deeply impressed by the moral aspect of one side of the case that his very conscience gets a twist in the direction of falsehood, which accounts for some of the outrageous untruths sometimes uttered on the platform by reformers.

---

* "A Treatise on Facts as Subjects of Enquiry by a Jury. By James Ram, of the Inner Temple, Barrister-at-Law. First American edition. By John Townshend, Counsellor-at-Law." New York: Baker Voorhis, & Co.

Mr. Ram treats all these points from the legal point of view—that is, not metaphysically, but historically. The light he throws on them is the light of experience, or, as lawyers say, of practice, and he illustrates very copiously, indeed too copiously, for the examples drawn from novelists and dramatists may fairly be pronounced worthless. It may be entertaining to read about the effect of smoke in obscuring the vision, as described in "Guy Mannering," or of distance in affecting one's judgment of the size of an object, as described in "Gulliver's Travels;" but these are, after all, scientific facts, and it would be absurd for a student to go to Swift or Scott for the verification of them.

THE NORTH AMERICAN FOR OCTOBER.

THE October number of the *North American Review* opens with an article from President Woolsey of Yale College, reviewing Professor Mountague Bernard's "Historical Account of the Neutrality of Great Britain during the American Civil War." Dr. Woolsey gives Mr. Bernard full credit for "upright intention and prevailing spirit of candor and impartiality;" but as he some time ago passed judgment on the work also in the columns of the *Nation*, the present article is most interesting as an expression of Dr. Woolsey's own opinions on the various points discussed in the Oxford professor's book. These have, of course, been made known to a greater or less number through his work on "International Law;" and more recently by his lectures to the students of the Senior Class at Yale on the *Alabama* case, apropos of Mr. Sumner's speech, and since reprinted in a pamphlet form, but never, we believe, published. Dr. Woolsey is, with the exception of Mr. R. H. Dana, Jr., the only American of learning and character who has passed the *Alabama* controversy in judicial review. Able as were Mr. Adams's despatches—and there are few things abler in diplomatic history—they were, of course, the labors of an advocate, and Mr. Seward was always too turgid and uncandid to make anything he wrote worth study. Mr. Bemis wrote very ably too, but it was in a hot controversy with Vernon Harcourt. The other gentlemen who have taken the matter up have been howling politicians, on whose lucubrations no wise men, not to speak of busy men, will waste time. We are sorry Dr. Woolsey has written so little on this theme, but what he has written all thoughtful men may peruse with profit.

The only other article relating in any way to political questions of present interest is Mr. Gamaliel Bradford's discussion of "Congressional Reform;" the reform consisting in the admission of the members of the Cabinet to places in the Senate and House, so as to defend and explain their own wishes in regard to the legislation affecting their departments, and, indeed, to mould such legislation. Mr. Bradford describes with a great deal of force the chaotic condition of business in both Houses at present, and the complete separation there is between the Executive —which alone knows exactly what laws are wanted—and Congress, which supplies the laws, owing to the practice of leaving the proposal of legislation completely to private members, and the shaping and pushing of it to committees sitting in secret. He points out, too, what has not been much noticed in discussions of this question—the effect the change would have in making cabinet offices attractive to men of a higher class of talent than now seek them, though how such men are to get the places, or make known their fitness for them, except through minority representation, he does not make very clear. But the whole article is worth careful perusal, and is an excellent specimen of the compact and pointed style of treatment of political questions which, we are glad to say, is every day becoming commoner.

In one of the chapters of her very agreeable "Recollections of Seventy Years," Mrs. John Farrar speaks of a ride which she once took in company with her husband and Mr. Bailey, the Astronomer-Royal, in the course of which the two scientific men amazed her by talking for an hour together perfectly good English, of which she understood not a syllable. "The effect was very curious," she says, "of hearing people converse in English without being able to comprehend what they said." We suspect a majority of the readers of the present number of the *North American* will, once in a while, have much the same feeling in reading Mr. Chauncey Wright's review of Wallace's "Theory of Natural Selection." The subject, too, is one more interesting to the general reader than any other in the whole range of science; and the dabbler in science may properly be condoled with on the difficulties which Mr. Wright's style interposes between the amateur student of Darwin and what even an amateur student easily perceives to be a very acute and able discussion of Mr. Wallace's arguments. That the style is evidently a good one if the reader were only master of the writer's vocabulary, and that the essay is in many places intelligible even to the uninstructed, will increase, rather than diminish, our supposed reader's regrets and aggravate his botheration of mind. Still, one may know too little about the Darwinian facts and arguments and yet find this essay highly profitable reading—as, for instance, in the various and seemingly conclusive attacks on Mr. Wallace's unnecessary and truly unscientific attempts at isolating human nature by cutting it off from other organic life by metaphysical boundaries; or, to use Mr. Wright's own language, which in this instance is certainly plain enough, Mr. Wallace seems to his critic to have laid aside his strictly scientific method in writing the final essay of the book, "and to have devoted his powers to the service of that superstitious reverence for human nature, which, not content with prizing at their worth the actual qualities and acquisitions of humanity, desires to intrench them with a deep and metaphysical line of demarcation." And in this place, as we have quoted these words, we may quote by way of supplementing them these others: "It is unfortunate that the prepossessions of religious sentiment in favor of metaphysical theories should make the progress of science always seem like an indignity to religion, or a detraction from what is held as most sacred; yet the responsibility of this belongs neither to the progress of science nor to true religious sentiment, but to a false conservatism, an irrational respect for the ideas and motives of a philosophy which finds it more and more difficult with every advance of knowledge to reconcile its assumptions with facts of observation."

It is fair to Mr. Wallace to say that this essay Mr. Wright conjectures, with what seems much probability, to express views which are the results of an earlier and less severe training than Mr. Wallace's scientific labors have since given him. It is fair, too, to say that his metaphysical theories —which Mr. Wright disposes of with skill and with occasional touches of great subtlety and acuteness—Mr. Wallace keeps carefully apart from his scientific work, and that for this latter, as embodied in the volume under review, his reviewer avows his cordial admiration and respect. It is fair, again, inasmuch as we have said what we have about Mr. Wright's style holding his reader off from his subject-matter, to admit freely the difficulty, while suggesting the propriety, of an observance, whenever possible, of Joubert's precept for metaphysicians—that they should not, as too many of them have done, put common thoughts into metaphysical language, but should study, as almost none of them have done, to put their metaphysical thought into the language of common people. The day will be a good one for thought, literature, and instruction when—decency being saved—the very last is seen of the practice, once prevalent and avowed, of writing for special classes and schools and coteries. By which general remark we certainly mean no impertinence to authors like Mr. Wright.

The three last articles in this number of the *Review* are the most readable of its contents. Mr. H. W. Homans, a writer new to us, makes a historic study of the late French Empire which is not only opportune, but is unexpectedly good and interesting considering how extremely opportune, so to speak, that subject is nowadays. We doubt if there is one of the opinions advanced by Mr. Homans to which exception could now be taken and sustained, though, of course, it may happen that the flood of light which we may expect to see thrown upon the ex-Emperor's career and upon the lives and acts of his associates, may to some extent modify the views of the Second Empire which most intelligent people are now holding.

Mr. F. Sheldon's "Pierre Bayle" is a pleasant sketch of a man, the present condition of whose reputation and vogue would never have been believed in by our ancestors of the last century. Too little thanks we give to him and certain of his contemporaries—half-forgotten soldiers in a half-forgotten fight, for fighting which our obligations to them are greater than we often stop to think—partly, perhaps, because the warfare is still going on, and it is easier to look with contempt on the character of their equipments, the methods of their campaigns, and their conceptions, real and imputed, of the nature of the issues involved, than it is to recognize their courage and services. Mr. Sheldon's writing is lively, perhaps a trifle too lively, and too much marked by a liking for point and a willingness to make aggressive remarks, which seem better as epigrams and evidences of discontent than as philosophical conclusions which the writer could make good; but it is not disagreeable reading, and this particular essay is instructive and worth having. Professor W. F. Allen's "Theodore Mommsen" is also good reading, and may be taken, we should say, as a correct, able, and judicious estimate of the distinguished historian's character and qualities, and also a record of his intellectual life. Like everything else from Mr. Allen's pen, it is thoughtful, and gives the reader an impression of the writer's careful accuracy.

Hardly so much could be said of the article entitled "Methods of History," which is not free from vagueness, and which seems to us to want freshness. It has, too, along with better things, a touch of a sort of oracular dogmatism, or rather oracular generalizing, which, to our taste, is not very agreeable, unless there is behind it strength of thought and depth of insight such as is very rarely indeed vouchsafed to man. For instance, there surely are better things than these to be said as to the "methods of history," and a better way of saying them: "States are at once the theme and the organs of history." "Property begins with agriculture." "Historic man was born, according to tradition, in Western Asia, precisely where speculative ethnology would place him." "The ages are genetically as well as chronologically related." "The age of the Argonauts reappears in the Crusades." "Reflection encounters Imagination in the Gulf of Salamis, and puts a limit to his sway." When one thinks of the willingness of all mankind—and we suppose we must say the exaggerated willingness of mankind in America, where thorough training in the more abstract kinds of thought is comparatively rare—to substitute easy and sweeping generalizing for the patient thinking out of things, one cannot refrain from condemnation of such men of ability as do anything to encourage in any way the lower classes in the "orphic" school of writers and thinkers. We do not know that Mr. Emerson has much to answer for, or anything to answer for, in this matter; for we certainly suppose his style to be the perfectly genuine expression of the character of his mind. And he is a man of genius. But it is certain that we have a number of men and women amongst us who have followed him to their own destruction as writers and thinkers; who are oracular without the least inspiration, and who utter disjointed platitudes and crazy fancies because they cannot discern the truth of their master's thoughts nor the links that bind them together, and at the same time can see so much as that he does not employ a formal logic. These are the men and women who have solved the universe. There is hardly a male among them who has not seen in a vision and could not teach a mother of six children what is the place of maternity in the cosmos; nor a female of them who could not teach Solon the true significance of government. One of these latter the other day—or there is a mistake somewhere—preached "a nobler, more soulful, more emancipating sermon," though based on the misconception of the meaning of some Greek words, "than ever rang out from any Boston pulpit." In short, wisdom, and probably geniality and earnestness, will die with them. But they have never done an hour's intellectual work in the whole course of their lives: for their opinions in law, politics, philosophy, theology, science, or literature, no lawyer, statesman, philosopher, theologian, man of science, or man of letters would give two straws; and no reasonably sensible parent would think of entrusting to their care, severally or collectively, a schoolboy who was to be taught anything definitely, or to be anything better than a conceited and feeble intellectual voluptuary, imagining his dreams and sensations to be the product of sound and valuable brains, and fit for use in lectures. We would not for a moment say that these remarks are to be applied to the writer whose article has suggested them; on the contrary, he has on various occasions done good service by opposing and attacking their works and ways; but it is certain, we should say, that he is not wholly unvitiated by their example, or rather that of their infinitely superior exemplar. However, the school is not what it was. And that it may wane still further and disappear, devout Americans who are friends of real thinking and learning may rightly pray hard.

"English Aristocracy and English Labor," by Mr. Edward Brooks, who is, we believe, an old contributor to the *Review*, though we do not remember him of late years, is a telling article expository of the condition since the Conquest of the English laborer, and more particularly of the farm-laborer as distinguished from the artisan. Mr. Brooks is careful as to the sources of his statements, which are drawn in most instances from laws and other authoritative records, and of course the picture that he discloses is a most painful one. It is too undeniable that rural England is even to-day in great part pagan, and, as its clergymen say of other heathen regions, "full of the habitations of cruelty," and we doubt if there could be successful dispute of any of Mr. Brooks's darkest assertions, though it is altogether probable that the general gloom depicted is, as was necessary to his method, too wholly unrelieved. But it is useful to look at what he reveals, if only for the reason that perhaps some of us Americans habitually allow ourselves to be too despondent in contemplating our own political and social state. We may add, in objection to Mr. Brooks's view, that, as it seems to us, he insists very much too strongly on the theory that the oppressing class, to call it so, in the England of the last century has been and is "Norman," and the oppressed class "Saxon." The amalgam of Saxons, Britons, and Danes was oppressing and oppressed before ever William landed at Hastings. And it would be a wise ethnologist who should undertake to say what fractional portion of the blood of the English middle and upper classes—landholders, merchants, and manufacturers—is Danish, what Saxon, what Celtic, and what Norman. In presence, however, of the practical question of righting the wrong, the ethnological question becomes of no importance. Still, even so, that is another reason why Mr. Brooks might have left this theory of his out of his essay.

Companions of My Solitude. By Arthur Helps. (Boston: Roberts Brothers. 1870.)—Messrs. Roberts Brothers, in reprinting this volume, have given us the seventh London edition of a little book of essays which first became popular some twenty years ago. It is much to the credit of the reading public in this country and England that they have had so long-continued a popularity; for the writer of them is a truly estimable and likable author, and wherever he is read there will be heard the words of a most kind-hearted man; thoughtful, and indeed often an acute thinker, if not often a very profound or subtle mind; a man of scholarship, and a writer over all whose writing is shed the grace of thorough good-breeding based upon soundness of the moral nature, great charity, considerate tact, and elegant cultivation of all kinds. It has been said of him that he is a somewhat smaller Emerson, so far as Emerson is a philosopher instructing men in the ordinary conduct of life; and so it seems to us that Mr. Helps may with approximate justice and accuracy be described. It is true, to be sure, that Emerson, though Lowell discerned in him the Concord Yankee in very close union with the mystical Brahmin, never, even when talking to us with most of prudential worldly wisdom, has forgotten to obey his own maxim, and to

> "Hitch his wagon to a star;"

and it is true that Mr. Helps's wagon generally is moved by motive-power less celestial; and that to travel with him, no matter what his theme of discourse, is a very different thing from travelling with the companion and guide whom he so much admires. But for all that, there is a wisdom which they have in common. Mr. Helps's wisdom may often be very far from absolutely wise; but oftener than most moral and social essayists he is really something of a seer and an independent thinker; and certainly, if sometimes it happens that he shows a temper not precisely that of the seer, it is much more likely to be because of the exceeding kindness and merciful justice of his heart than because he is ever wanting in the patience and tolerance which are so apt to be wanting in ethical and social reformers. Indeed, the closeness and kindness of his sympathies, the obviousness of his not very powerful but still delicately strong sense of humor, and the trained capacity for social observation which has borne fruit in such sketches of character as the portrait of Ellesmere, for example, have no doubt been sufficient, and will long suffice to make him directly useful to a much larger circle of readers than it is probable that our American teacher will ever at one time reach. It is easy to imagine Mr. Helps a great favorite with thoughtful men, not much engrossed with affairs, but still interested in affairs, and liking thoughts on various social problems better than they like the labor of thinking on them without assistance. And still easier is it to imagine him a favorite with women of the best class, asking for goodness of heart in their favorites, and refinement of manner and suggestiveness of mind—women in some respects very like, and in others very unlike, Walton's famous milk-maid who loved poetry, and "had not yet attained unto such age and wisdom as to load her mind with cares for many things"—like her and unlike her in loving what is fine and refined, and in not having loaded down their minds with cares of many troublesome things, though to some such things they habitually attend. To such readers Mr. Helps should be dear.

That Mr. Helps has been of any service in the settlement of the many questions which he has discussed with so much good feeling, cleverness of manner, and ingenuity, no one is yet able to say. The influence of a man who writes out generous and beautiful feelings and thoughts—which are yet, perhaps, too generous and beautiful to be formulated into rules for speedy action—is, as he himself somewhere says, not easily calculated: because what such a man writes is valuable rather as, sooner or later, inducing in a certain number of minds, some of them unpractical and some practical, certain habits of thought which, by-and-by, perhaps not for generations, get themselves realized in laws and customs. But that he has thus offered for the consideration of his own generation many views and opinions which his contemporaries have at least been none the worse for contemplating; and that the world of letters owes him thanks for the skilfulness of his method of presentation; and that the world of manners may look on his example as serviceable to the best refinement, will not be denied by any one who has read "Realmah" and "Friends in Council," and this "Companions of My Solitude."

Fine Arts.

AUTOTYPES AND OLEOGRAPHS.*

THE drawings of Michael Angelo and Raphael copied in these autotypes are from the University Galleries at Oxford. They are mentioned by Mr. Ruskin in his last lectures as Slade Professor there, and will serve him and his readers for reference again. The remainder photographs are from original drawings and engravings of Albert Dürer and Lucas van Leyden, exhibited last year by the Burlington Fine Arts Club. The Dürer section comprised nearly all the copper engravings, many of the principal impressions being of the highest excellence and rarity, according to Mr. Wm. Scott. The "Knight and Death," exhibited by Mr. Morrison, was purchased by him in 1868 at the price of £94.

The autotype process of photographic printing is said to differ from the method employed in the French "carbon" photographs made and published by Braun, of Dornach, and exhibited here last winter. The French photographs imitated more closely, perhaps, the texture of the original drawings, and their surface was more pleasing to the eye. The comparison is a fair one as regards the copies of drawings; as yet, no photograph renders successfully the look of impression upon paper by copper, wood, or stone. The wax-paper process which first copied Albert Dürer's engravings and Rembrandt's etchings a dozen years ago—Bisson being the photographer—did not interpose the look of a varnished or horny substance between the eye and the copied lines of the graver. The whole impression seemed imbedded in the paper, and recalled the similar effect of an engraving. In this way their now faded charms had an artistic value unknown to the more secure process of the "carbon" and the autotype.

In these renderings of engravings, some mistranslations are particularly evident. The photographic proof gives much shorter gradations, and darkens the blank spaces between the lines; so much so that there is a marked superiority in the copies of those originals distinguished by large open masses or spaces of white paper—as, for instance, the "Prodigal Son," by Dürer—or of such as depend in great part for effect of ornamental beauty upon the distribution or spotting of the lights and darks, as is the case with Dürer's "St. Christopher." In this way, the light proofs, which do not make such a distribution, look pale and flat beside the darker ones, which somewhat heavily accentuate the original intention. With all these disadvantages, the harshness of a translation in which are lost the more delicate and the fuller vibrations of the original execution, does not detract from those greater qualities which the photograph can transmit absolutely.

We need not dwell upon the abundant merits of the drawings reproduced. They are, however, in both collections, but accidental fragments, however precious, of the vast collection of European studies by the masters. In the engravings, we can see, all together, what the French call the "work" of Dürer and Lucas van Leyden; its complete and definite result; the sum and object of their fullest powers; their monumental brass, indeed. Very naturally, our references have been made in preference to Dürer's works; it is to their cheap multiplication that we wish to call attention, as to the main importance of these fac-similes. For Albert Dürer, from what were hard circumstances with him, put his main strength into his engravings; and no great art can lose less than his and be more exactly represented by photography. In such a way, photographs from his famous engravings are fair examples of a noble form of cheap art, which we could hope to see common—as common as the nature of good things will allow. His most personal creations live with a life not outside of natural, untrained appreciation, however rich in increasing interest they are as subjects of observation and study. Take, for instances, the "Melencolia" and the "Knight and Death."

It is not merely that such things give the only easy sight of famous and costly originals, that they offer us cheaply to-day what a few years ago was hard to seek, but that they are preservatives against the duration of meanness and vulgarism. Their superiority to the objects of our usual liking; a certain necessary difficulty in their appreciation; the happy fact that they must always be somewhat foreign, and that we must always put aside some prejudice when we wish to see them truly—in other words, that they never can be patronized—gives us, through them, a chance of avoiding the debasing use of art as a mirror for self-admiration. If the foreign god can only seat himself humbly alongside of the domestic idol, some fine day surely the latter will come to grief.

The same impartial publishers advertise also the "Oleograph." This "oleograph" differs from its brother and our old friend the "chromo," in some cases, through a certain lithographic flimsiness, characterizing, perhaps, its easy Italian manufacture as compared with the heavier Teutonic pretensions to honesty of the "chromo;" in other cases, the oil-paint impression rivals in thickness the oil-paint of hand-painted pictures, and, of course, imitates that look of paint quite well. The specimens published are copies of very poor Italian work, and of old paintings famous for extreme finish and inimitable drawing. They are "confidently recommended" by the publishers as "admirable studies for young artists"—a recommendation which seems to us all the more unfortunate that we were just about to ask why it is that the chromo-lithographic imitation of oil-painting is a type of everything in bad art that is most disgusting to the artist and to the cultivated. It is not because of any cheap democracy of the "chromo;" a certainly more democratic art, to which no aristocratic art objects, is the wood-cut. It is not because of the disagreeable appearance of a smooth, oily impression on paper, since, as a recorder of facts, the chromo-lithograph is well used in publications of art and archæology, where it copies tapestry, enamels, metal-work, etc., with success. Even for the poor drawing and bad coloring of the chromo all allowance would be made, were there no easier and surer means of obtaining records of fine originals. At bottom of this disgust we shall find the sensation of sham, of a swindle which disappoints even while it deceives—the uneasiness which one feels in the presence of pinchbeck jewelry. And this last comparison might explain why persons of doubtful taste have taken a fancy to the chromo, and have made much of it in print. Perhaps it may be well to notice how the absurdity of the chromo-picture lies in this, that it uses oil-painting to imitate oil-painting, being therefore nothing but an inferior and more mechanical method of applying oil-paint to a given surface. Now, oil-painting has its laws of method, the result of long experience, and some of its worst stages correspond pretty well with the methods of chromo-lithography. Hence the fatal success with which a poor painting is duplicated by the "chromo." And hence, besides his moral disgust, the aversion of the painter to the chromo-picture. He must often fear that his painting may possibly look like it, and his soul protests within him.

---

* "Autotype Fac-similes of Drawings (and Engravings) by Albert Dürer, Lucas van Leyden, Rafaelle, and Michael Angelo: printed in permanent colors." London: Edwards & Kidd. New York: G. P. Putnam & Sons, Agents.

* "Oleographs, or Perfect Representations of Fine Oil Paintings after Old Masters and Modern Paintings." G. P. Putnam & Sons, Agents.

It is then quite open for any one to see why the chromo-copy cannot imitate a good painting. That it deludes those who do not know, or that, as Mr. Parton says, it gives him all that he can enjoy of an original, is a misfortune to be remedied by cultivation, but assuredly is no particular plea in its behalf. As much might be said in favor of hand-organ music. Unfortunately, also, the "chromo," being mechanical in the process of its printing alone, depends for all its art qualities upon the superior art of its workmen. They do its drawing and choose its colors. So long as its workmen are not first-rate, the one great thing which it could give us, accurate and sympathetic copy of the drawing and composition of good or great work, we are as yet debarred from. This it is not yet the interest of the publisher to give us, both because he must have cheap work, and because he must not interrupt the course of trade. Let us remember that the chromo-manufacturer is not called upon by his profession of making as much money as he can to elevate the taste of the public, and to give us a better article than we ask for. What his interest is has been well shown by Mr. Parton, who, with Mrs. Stowe, has done much for the literature of the subject, viz.: there was a worse thing which this is replacing—the manufacture of cheap oil-painting by the wholesale, painted in a way not dissimilar to the chromos, but very much more dingy and disagreeable in color.

The foregoing considerations, perhaps too grave, will not interfere with our purchase of "chromos." We shall, most of us who know better, even our artist-friends, doubtless, buy them for our children, our servants, or for some of our acquaintance. To quote the artist in Mrs. Oliphant's last novel: "There's my brother, who doesn't know the difference. I shall buy him some of those vile chromos."

VALUABLE NEW WORKS
JUST PUBLISHED BY
PORTER & COATES,
822 CHESTNUT STREET, PHILADELPHIA.

The Prose Writers of Germany.
A NEW AND REVISED EDITION.

With Introduction, Biographical Notices, and Translations. By FREDERIC H. HEDGE, D.D. With Six Portraits on Steel and Engraved Title. Imperial 8vo, cloth, extra, gilt top, bevelled boards, $5; sheep, marbled edges, library style, $6; half-calf, gilt, $7 50; Turkey morocco, $10.

"There is no book accessible to the English or American reader which can furnish so comprehensive and symmetrical a view of German literature to the uninitiated; and those already conversant with some of the German classics will find here valuable and edifying extracts from works to which very few in this country can gain access." —*Prof. A. P. Peabody, in North American Review.*

Mother Goose in her New Dress.
A SERIES OF BEAUTIFUL CHROMOS,

From Designs by the Daughter of one of the very highest officials in the United States Government.

"Original, graceful, and sprightly."—*Public Ledger, Philadelphia.*

"One of the best specimens of chromo-lithography yet produced in the United States, equal to the best productions of that art in Paris, London, and Berlin."—*The Press, Philadelphia.*

"Few books have been issued in lordlier style."—*Evening Bulletin, Philadelphia.*

"A series of chromo illustrations, which display much genius and humor in design, and which are beautifully executed."—*Eastern Argus, Portland.*

Large 4to, bound in cloth, with linen guards, bevelled boards, gilt edges, and illustrative side-stamp, price $4 50; cloth, extra, gilt, bevelled boards, linen guards, price $3 75.

In Press:

LONGFELLOW'S POETS AND POETRY OF EUROPE. New Edition just completed, with the addition of 150 pages *entirely new matter*, by Prof. H. W. Longfellow.

GRISWOLD'S PROSE WRITERS OF AMERICA. New edition, revised and brought down to the present time.

*** Sent by mail upon receipt of price. For sale by all Booksellers.

SPECIMEN ILLUSTRATIONS

From nine of Doré's illustrated works, and from nearly thirty-four other volumes, including Shakespeare, Gulliver, Fox's Martyrs, The World Before the Deluge, A Handy-Book of the British Museum, Chefs-d'Œuvre of the Industrial Arts, in Cassell's Illustrated Catalogue.

CASSELL, PETTER & GALPIN,
London, and
596 Broadway, New York.

HURD & HOUGHTON,
13 Astor Place, New York,
HAVE JUST PUBLISHED:

I. The Children's Crusade. An Episode of the Thirteenth Century. By George Zabriskie Gray. In 1 vol. 12mo, extra cloth, $1 75.

*** A most interesting and fresh narrative of a passage in history never before presented in detail. The strange experience of the children, the romantic and pathetic character of their wanderings, and the mystery that hangs over certain portions, render this narrative more fascinating than a work of fiction. The author has based his work upon full and careful researches in European libraries.

II. Coughs and Colds; or, The Prevention, Cause, and Cure of various Affections of the Throat. With cases illustrating the remarkable efficiency of out-door activity and horseback exercise in permanently arresting the progress of Diseases of the Chest. By W. W. Hall, M.D., author of "Health by Good Living," etc. In 1 vol. 12mo, half-roan, $1 50.

III. The Philosophy of Eating. By A. J. Bellows, M.D. In 1 vol. 12mo, cloth, $2.

*** An enlarged and improved edition of a work which in its first form had a wide sale.

IV. American Edition of Dr. William Smith's Dictionary of the Bible. Revised and edited by H. B. Hackett, D.D., assisted by Ezra Abbott, LL.D. Vol. IV. 8vo, cloth, $6 50.

*** This volume completes the work; and the four volumes, with valuable additions to the English original and with copious indexes, constitute the most complete and serviceable Dictionary of the Bible in the English language.

V. The Sparrowgrass Papers; or, Living in the Country. By Frederick S. Cozzens. In 1 vol. 12mo, cloth, $1 50.

*** The first volume of a new and uniform series of Cozzens's writings. Each volume sold separately.

Recently Published:

1. PARIS IN DECEMBER, 1851. $2 50.
2. LIFE OF ARTHUR TAPPAN. $2.
3. GILMAN'S FIRST STEPS IN ENGLISH LITERATURE. $1.
4. ANDERSEN'S "ONLY A FIDDLER." $1 75.
5. BENJAMIN'S "THE CHOICE OF PARIS." $1 25.

For Sale by all Booksellers. Any of the above sent free of expense by the Publishers on receipt of price.

To Collectors of Choice Books

The Nation.

NEW YORK, THURSDAY, NOVEMBER 17, 1870.

The Week.

THE French have finally had their first victory in the field. The contest was severe, and its fruit was the retaking of Orléans, which General D'Aurelles de Paladines entered on the 10th inst. There seems to have been no pitched battle, but a series of minor engagements, fought chiefly on the north bank of the Loire, near Coulmiers, west of Orléans, a place which a learned Cable telegrapher took pains to inform us was not identical with Coulommiers, between Paris and Châlons. Our transatlantic instructors are, however, less precise in imparting chronological information, for the closest examination of the many contradictory statements sent us about the "two days' battle" fails definitively to settle the question whether the struggle took place on the 8th and 9th, or on the 9th and 10th, though we are inclined to decide in favor of the earlier dates. That the statements concerning the losses on both sides are equally contradictory, nobody will find surprising, received, as they are, from the opposite camps. The victorious General states his aggregate losses in killed and wounded to be less than two thousand, "while those of the enemy are much larger." The defeated General, Von der Tann, acknowledges—in regard to both days, we presume, though but one is distinctly mentioned—only a loss, in killed and wounded, of "forty-two officers and six hundred and sixty-seven men"—which is a rather unusual proportion between officers and men, if the figures be correctly rendered. He has, however, lost besides—which the published Prussian bulletin does not state—about two thousand prisoners and two pieces of cannon.

That the Prussians, in their fight and retreat, lost no more than two pieces of cannon—according to the French General's own statement—is a sufficient proof that they suffered no signal defeat, and that the wild stories of victory which filled the Tours journals were but the natural and, under the circumstances, pardonable exaggerations of patriotic fancy. The good people of Tours, of course, expected the victor to march directly on Versailles, there to break through the lines of the besieging army before Paris, and to form his junction with Trochu, who was to sally forth at the head of 150,000 men. But Von der Tann was, immediately after the evacuation of Orléans, reinforced by troops under General Wittich, Prince Albrecht, and the Grand-duke of Mecklenburg-Schwerin, and D'Aurelles de Paladines advanced in his pursuit only as far as Chevilly, a few miles from Orléans, where he seems to have occupied a naturally strong defensive position. The comparative or absolute strength of the two armies, as it was before the first encounter, or as it is likely to be in the next struggle—which is said to be imminent—cannot be ascertained from the scanty and untrustworthy data before us. We do not believe, however, we run much risk of error in asserting that, at this writing, neither army can fall much short of, or by much exceed, the number of one hundred thousand. Reinforcements are hurried on from both sides, and both armies may be expected to fight well next time. The *élan* evinced by the French troops in the fights around Coulmiers is extolled by their commander, and the rigor with which he has endeavored to create discipline is the theme of many a correspondent. If the "Army of the Loire" has finally become a reality, it is the merit of D'Aurelles de Paladines.

In the East, the French have been much less successful. The repeated reports of successes achieved by Garibaldi or others in the Department of Doubs have proved to be inventions; and the whole region, with the exception, as it seems, of Besançon, has been abandoned to the invaders, who successively captured Montbéliard, Isle-sur-le-Doubs, and Clerval, and threatened to cut off the troops under Mihiel and Garibaldi, of which the main body retreated to Chagny and Autun. In this new position, between the hills of the Côte d'Or and the Monts du Charolais, they may, with the aid of reinforcements from Lyons and other towns of the South, attempt to cover Creuzot, with its mineral and industrial riches, and to get between the armies of Von Werder and Von der Tann—which Garibaldi expresses by "being near Gambetta;" but almost the whole of Franche-Comté, as well as the south-east of Burgundy, is sacrificed by this retreat, and the road to Lyons on the east bank of the Saône laid open. This city, however, is too strongly fortified to tempt a German advance on it by an outer line. The French have thus given up the Department of the East in order to save "the inner lines" between the Loire and the Saône, and in this they have acted wisely and in accordance with sound principles of strategy; for an obstinate defence of the line of the Doubs would inevitably have led to the surrender of the forces concentrated on that river, besides opening to Von Werder a broad road to the Loire.

New-Brisach, with a garrison of five thousand, has surrendered after a siege which cost the Germans but little. With the exception of Belfort, which is closely invested, the whole of Alsace is now in Prussian hands. In Verdun, the Prussians captured two generals, about four thousand men, one hundred and thirty-six guns, and a very large amount of military stores. Thionville is vigorously bombarded. The military movements reported from Picardy and Normandy are insignificant. Kératry is active for defence in Brittany, and Bourbaki at Lille, though his "army, if it exists, is certainly not here," the town having "but three battalions of National Guards partially equipped"—as we learn from one of those special correspondents who do not scruple to do from time to time a little espionage. Reporting from Paris, however—whether by balloon or pigeon mail—has almost entirely ceased, and all we know from that besieged capital is, that firing from the forts is rarely done, that the order within has not been violently disturbed since Flourens's attempted *coup d'état*, that Trochu is active organizing and drilling his "three armies," and that food is becoming distressingly scarce. The impression in unofficial circles at Versailles is that Paris, if unrelieved by the grand sortie which Trochu is presumed by some to be preparing for, must within a very short time succumb to famine, and that, therefore, no bombardment will be resorted to by the German commanders, who are confident of their ability easily to baffle any assault on their fortified positions.

The effect of the success of General D'Aurelles de Paladines—a very inconvenient name for a prominent man in a democratic age—upon the French public in the South, and on Paris, will help to prolong the war, if he is able to follow it up, even slightly, which we doubt, as Von der Tann grows stronger as he falls back, and Prince Frederic Charles is on the march with a force which will probably be able to destroy the army of the Loire in a single blow. Of course, if the new general is a genius of the first order, he might even yet raise the siege of Paris and save France. But he is hardly a genius; and his force, though it has behaved well, and will be improved by success, would fling itself in vain against the coming foe, and the fresh levies which the news of his success will bring in to him will probably embarrass rather than help him. That he feels the uncertainty of his position is evident from his fortifying himself.

Prince Gortchakoff has issued a circular, urging the right of Russia to be released from the obligations imposed on her by the Treaty of 1856, on the ground that it has been disregarded by others; but then he denies that Russia entertains any hostile designs towards Turkey, and says she is willing the Sultan should come into the Black Sea, too, on equal terms, and that she has no desire to rekindle the Eastern Question. The fact is that Russia is not in a position just now "to rekindle the Eastern Question," and could gain nothing by doing so, though it is yet very doubtful whether England will consent to the entrance of a Russian fleet into the Black Sea from the Mediterranean. It is a mistake to suppose that England cannot alone, or in conjunction with Turkey, prevent the appearance of a Russian fleet in the Black Sea. Nothing is easier; and, without the introduction of a ready-made fleet by way of the Dardanelles, Russia cannot make a formidable show in the Black Sea for some years to come. A fleet cannot be built or launched in a day, particularly where there are neither dockyards nor arsenals; and without a preponderating naval force in the Black Sea, a land advance on Constantinople is impossible.

The failure of the armistice, the threatened Russian complication, and the French victory at Orléans, have combined to disturb and unsettle all markets, but without producing any very material changes. The first resulted in a fall of cotton at Liverpool almost equal to the previous advance, while the latter two have failed to depress it further, in spite of the extremely favorable crop accounts and the large receipts of the week, amounting to over 130,000 bales—an amount, we believe, quite unprecedented for the season, and especially remarkable in view of the fact that the crop has heretofore been rather late in coming to market. Breadstuffs have been somewhat firmer, owing to the indisposition of farmers to sell at present low prices. The exports of both these leading articles have not been heavy, and there has, consequently, been a slight advance in gold, further stimulated by a very marked decline of our bonds in London and Frankfort on the Russian news. The financial markets have otherwise been dull and stagnant, though stocks have been higher on clique movements and combinations, of no interest to the general public. Money is easy and trade dull, coal low, and real estate inactive.

Rome is still the preoccupation of its new possessors. The irresolute ministry have at last dissolved Parliament, and thrown the questions of how to manage the Pope, and how to harmonize the Roman territory with the rest of the kingdom, back on the people. In the meantime, nearly all the regulations decreed for the Romans have been exceptional. In certain cases, the embarrassment of the Government was natural and pardonable, as, for instance, concerning a penal code. No less than four are in vigor in different parts of the peninsula, and a fifth prepared by special commission, to take the place of these and become general, yet waits the sanction of Parliament, and, if extended now to Rome, might shortly have to be modified. The Sardinian and Tuscan codes are on the eve of being abolished, and the retention by Venice of the Austrian code is one of those anachronisms under which Italy has too long labored. The decree in relation to the press has been justly resented, because of its penalties for want of respect to the Pope, and because journals from without, which avail themselves of the constitutional liberty of the press, are to be excluded if they offend in the manner indicated. The inference is strictly logical that the Government, if left to its own devices, would restrict the liberties of the kingdom at large; but nobody seriously apprehends that its anomalous, and perhaps unconstitutional, action towards Rome is due to any deeper cause than its anxiety to keep its promises to the Pope. That venerable pontiff, for his part, still maintains an attitude of passive resistance; holds on to the Quirinal; refuses to receive La Marmora, except as a private citizen; and, with the aid of a few foreign ambassadors, keeps up the singular spectacle of a court without subjects and without territory, and whose very seat depends upon the favor of other sovereigns.

We are informed on good authority that Colonel Forney was sent for by the President after the appearance of the Cox correspondence, and that it was he who wrote the explanation on which we have commented elsewhere, as well as advised that exceedingly foolish proceeding, the publication of the McGarrahan letter. A triumphant article on the change at Washington has also appeared in the Colonel's *Press*, in which he abuses Mr. Cox savagely; announces joyously that Grant is now going to rely on "his friends;" calls the Civil Service reform a "superfine idea" and a "sickly sentimentality;" tells some stories, which we are afraid he knows well to be untrue, about all candidates for office undergoing a "thorough examination" at Washington; denounces fiercely the opposition to assessments on office-holders as "mawkish and miserable susceptibility;" and, in fact, proclaims trumpet-tongued the sickening truth, which the country has for weeks been struggling not to believe, that the President has fairly committed himself into the hands of the Colonel and his kind. It is interesting, too, to run over the list of papers by which Cox is denounced and the new régime glorified. With very few exceptions—the *Hartford Courant* is one—everybody familiar with the press might have predicted which they would be, on *à priori* grounds which we will not now specify. One of the most striking incidents of the crisis is that the New York *Sun* is, we suppose for this occasion only, ranged on the President's side. Forney is talked of for the Postmaster-Generalship, but we believe the only foundation for this, thus far, is his having been called to Washington as a counsellor and scribe. Delano goes into the Department of the Interior, and his advent is generally received with great satisfaction by the politicians, who look on him as a good safe man of the Boutwell "stripe," "who will take care of his friends."

What is the meaning of all this? Well, the meaning is, that General Grant likes being President; that he wants the renomination; that he has been discouraged by the way in which Congress met the attempts at reform of the past year; that the politicians have got hold of him, and have succeeded in persuading him that he has committed an immense mistake, but that if he will put himself in their hands he can still retrieve it; that he must get rid of such impracticables as Cox, and fall back on the good old plan of "taking care of his friends" and waging war on his enemies. The first-fruit of their labors was the dismissal of Wells, for which, however, Boutwell, who sympathizes with them, and does not believe in Civil Service reform, or statistics, or study, but does believe in a metaphysical abstraction which he and men like him call "the people," was mainly responsible. Then Hoar went, but the President, who really liked and respected him, did not resort to dismissal till he had tried in vain to put him on the bench of the Supreme Court. Cox has now gone, and Fish, we repeat, will probably go soon. The dismissal of Motley was the result of rage against Sumner for his hostility to the St. Domingo treaty, which was concluded without Fish's knowledge, and of the iterated whisperings of the new advisers that the Minister in London represented not the Administration, but the Chairman of the Senate Committee of Foreign Affairs. Mr. Motley has now been summarily recalled. Other achievements of the new power have been the absurd attempts to influence the Missouri election, which has resulted in the overwhelming triumph of the bolters, and the bitterest hostility to the President on the part of the Gratz Brown wing of the Republicans, which will probably hereafter control the State, leaving the Administration to get what comfort it can out of Mr. Drake's rhapsodies.

It is altogether a pitiful story, one of the most pitiful in political history. The wreck of General Grant's fame is a national misfortune. That fame was a national possession, and it was the best people of the country, those whom he is now repudiating or refusing to rely on, who built it up by giving him the hearty and unfaltering support in the field and at the polls which alone enabled him to make head against the worthless gang whom he has now taken into his confidence, and who will now use him for his destruction and the filling of their own pockets. We believe the opinion of the shrewdest observer is that the work of "manipulation" and "management" will be done with sufficient dexterity to give him control of the convention in 1872. Of course it is rather soon to indulge in speculation on this subject, but it is not too soon for the friends of reform and good government to decide on what their course should be from this time forward. Their first duty clearly is to give no encouragement or support to the corrupt régime which is being established at Washington; the second, to do what in them lies to prevent any man's getting the Republican nomination for the presidency who seeks it as General Grant is seeking it; and the third is, to see that if he does get it, it shall profit him nothing. The time has come for all friends of reform to stand firm and fast before the tide of corruption rises any higher. The present breed of politicians will assuredly die hard and will "deceive many," as their progenitors have done in all ages, before they got their quietus, but get it they will eventually. We are not urging anything Quixotic on the public attention. A good measure of Civil Service reform would do two-thirds of the work, by depriving the whole crew of their gambling materials; the other third could only be accomplished by the gradual recovery of public opinion from the effects of the debauchery of the last forty years. The first result of the work, too, would probably be a considerable increase of crime and the multiplication of certain fraudulent callings, but the checking of these could safely be left to the courts. In addition to the indications of the increasing popular interest in this subject which we spoke of last week, we may mention that at Mr. Mundella's lecture on Monday evening, at the Cooper Institute, his declaration that he "stood before them as the representative of one of the largest constituencies in England, without the power to influence in the smallest degree the appointment of a custom-house officer or an exciseman," drew down thunders of applause.

We understand that it was found impossible, during the late canvass in this State, to get much, if any, money from anybody but office-holders, and this is alleged in excuse for the "assessments." The reason is, however, not far to seek. The number is small, and is growing smaller, of honest or patriotic men who, having any money to give, will hand it over to the class of persons who now do the "management" in this and many other States. Anybody who gave money to help Conkling to beat Fenton, or Fenton to beat Conkling, and to be expended by some of the gentlemen who recently called for it, must have had very loose notions of his duty with regard to his possessions, and we are glad to find such people were scarce. By all means let the supplies be stopped; no hardship will result from it; the Government will certainly not suffer; and as to the politicians who live by contributions and "assessments," the cranberry swamps and strawberry and lettuce beds await their industry in all parts of the country.

The late elections were marked in an unusual degree by local differences, which it is worth while to recapitulate. In Massachusetts the alliance of the Labor Reformers and the Prohibitionists was promoted, it is believed, with a view to sending Gen. Butler to the Senate not less than to putting Mr. Phillips in the Governor's chair. The result has shown that under the most favorable auspices the first-mentioned party could not muster more than twenty thousand votes, and that it has in all probability touched its high-water mark. The causes of Mr. Jenckes's defeat in Rhode Island have been, we are persuaded, correctly indicated; but, as they seem likely to be passed upon by the courts, we shall not dwell upon them now. The wealth and power of the Spragues have succeeded in preventing Mr. Jenckes's return to Congress, but he has the consolation of knowing that the reform with which his name is identified is sure, in some form or other, to prevail ere long, and that it has never had so many friends as now. The Missouri overthrow, besides its bearing upon national politics, secures the restoration of the disfranchised whites, and will probably lead to the framing of a new constitution for the State. The vote in Michigan upon State issues embraced sundry constitutional amendments, one of which was to strike out the word "white" wherever it occurs. This was undoubtedly adopted. Another was the one submitted by the Legislature after a special session, and was intended to counteract the previous decision of the Supreme Court touching the validity of municipal railroad bonds. The amendment did not authorize these bonds to be issued hereafter, nor did it validate those already issued, unless confirmed by a popular vote in every case. The adoption of this amendment, which the Democrats generally, for reasons good or bad, opposed, was in doubt at our latest advices. Kansas has done well to send Judge Lowe to Congress in place of Mr. Sidney Clarke, who has done more than any other representative to embarrass our Indian affairs and prolong border warfare and the reign of corruption. He hopes to be able to reach the Senate, but we trust that in this he will be disappointed.

On comparing the results of the elections, still incomplete, with our estimate in July, when we gave the Republicans a majority of 44 (more properly 43 or 45, since we reckoned six instead of seven Representatives from Georgia) in the next House, we have of course many corrections to make in detail, though we predicted quite accurately for two such mixed battle-grounds as New York and Pennsylvania. Supposing the States whose elections are yet to take place to have no effect on the relation of the two parties, we must now apparently set down the Republican majority at no more than 37, while the *Tribune* reduces it to 31. The power of the Opposition to obstruct legislation will thus be very considerable, and it is safe to say that the Republican party has just passed a crisis from which only extraordinary luck or extraordinary behavior will enable it to recover. It remains to be seen whether it contains the elements of regeneration which may yet give it a long lease of life, or whether another year will see it divided on questions which every one can name in advance, and which it will have to face.

Mr. Phillips, though nominated by two parties, "Labor Reformers" and "Prohibitionists," and fighting under the bright eyes of the ladies of the Woman's Suffrage Association, only polled 22,000 votes, being only very little more than the Labor Reformers alone polled last year. His canvass was enlivened by the horrible fight with the Radical politicians to which we made a brief and very inadequate allusion a fortnight ago. Both parties, and Mr. Phillips especially, have come out with marks of very severe "punishment," and present on the whole as improving a spectacle as the people, and particularly the young people of Massachusetts, have gazed on for many a long day. All is not over yet, we are glad to say. The two series of articles in the Boston *Journal*, of which he furnished the fruitful theme, have been suspended, but it is reported that Mr. Bird is going to exhaust the subject in a pamphlet. The views on consistency which the great agitator has propounded in defence of his various contradictions of himself have been very interesting, but not satisfactory. If a man has not been provided by nature with mental apparatus capable of producing opinions on any subject that will last over half a year, he is bound to modify them as often as may be necessary; but this, so far from warranting him in abusing and slandering those who do not change their minds as often as he does, puts modesty and silence amongst the first of his duties. A perpetually crowing weathercock is a ridiculous phenomenon, and an annoying one as well. There is one subject, we ought to add, on which Mr. Phillips's opinions never seem to vary, but we need hardly mention what that is.

Mr. Mundella, the English Member of Parliament who ousted Mr. Roebuck at Sheffield at the last election, delivered a lecture, at the Cooper Institute, in this city, on Monday evening, prior to his departure for home. It was devoted mainly to an account of the various administrative reforms in England which have been or are being effected under the liberal régime, but, what was most interesting of all, was his account of the Councils of Arbitration and Conciliation established, through his exertions, in Nottingham, where he is a large employer of labor. We have referred to them several times already in our columns, but workmen and employers cannot study their working too closely. They found the trade of Nottingham nearly ruined by incessant strikes, and with the bitterest hates raging between the trades unions and the capitalists. Since their establishment there has not been a single strike or a day's labor lost in any trade which has adopted them. The hosiery trade began them; the lace trade then followed its example; and the system then spread to other towns, and is spreading all over the country, even to the great iron districts. Nothing can be simpler than the machinery: Seven delegates from the trades unions meet seven delegates from the employers once in three months or oftener, and sit round a table in a private room, and talk over their differences and common interests. If they cannot come to an agreement—and in Mr. Mundella's experience this has only happened once—they call in an umpire. Everybody is satisfied, and this one little simple device has probably done more for the spread of Christian feeling, and the promotion of real civilization, and the security of property, than the legislation of the half-century. Any "labor reform" demagogue in this country who will come down off the stump and devote himself to work of this kind, instead of stimulating class hatreds, assuredly, if he is honest, will have his reward.

THE "EXPLANATION" IN REPLY TO MR. COX.

Nothing could be more unfortunate than the way the politicians have got General Grant into a scrape, except the way in which they are trying to get him out of it. When Mr. Cox's resignation was first announced, all their Washington correspondents and all the newspapers under their influence began declaring with great vehemence that it had been sent in for "personal reasons" solely, and notably on account of the smallness of his salary and the high cost of living at Washington. The way in which this pathetic invention was for two or three weeks rolled about from one to the other was very amusing to those who had any acquaintance with the facts and knew what was coming. When the correspondence was published and it was found that the reasons of Mr. Cox's resignation were not "personal," and that there were substantial differences between him and the President, the party hacks suddenly and unblushingly changed their base, and began declaring loudly that it was the McGarrahan claim which had driven him from office, and that civil service reform had nothing to do with it. Now we said three weeks ago (Oct. 27) that "they were anything but friends of the President who were circulating the reports that he and Mr. Cox had had differences about the McGarrahan claim." What has since taken place has strikingly justified this warning. The President's new advisers have—with that fatuity which distinguishes nearly all their appeals to the public—and indeed distinguishes every part of their policy in which the low cunning which is their principal mental characteristic cannot be turned to account—published Mr. Cox's correspondence of last August with the President about this claim, with running commentaries, made up partly of falsehoods and partly of absurdities—one of the silliest of the former being an assertion that Mr. Fisher, the Commissioner of Patents, was the author of an article or articles in the *Nation* on Mr. Cox's resignation.

Now, the history of the McGarrahan claim is this: It has been before the United States courts for twelve years in various forms; it has been by those courts four times pronounced "invalid and fraudulent," the last time by the Supreme Court in 1865. The subject of the claim is certain mining lands in California, which, if they do not belong to McGarrahan, belong to the United States Government. These lands or part of them are now claimed by the "New Idria Mining Company," who ask to have them surveyed and a patent granted to them by the Department of the Interior. McGarrahan has been trying to stave this off by appeals to the courts; having utterly and finally failed in the courts and drawn down on himself and his backers as severe a rebuke as ever fell from the judicial bench, he resorted to Congress, and lobbied fiercely for special legislation; and in two Congresses he has failed to get any such legislation, but he did get his claim before the Judicial Committee of the House, and, knowing well that this was his last hope, he was naturally anxious to keep it there, particularly if by keeping it there he could block all movement on the part of other claimants. Moreover, committees of Congress are not judicial bodies. They hear in secret; they take whatever evidence they please, and they report under the influence of whatever motives are most agreeable. A man beaten in the courts can hardly go to a more congenial atmosphere.

The New Idria Mining Company, however, now pressed Secretary Cox to pass on their claim to a patent, and an examination of their claim was ordered by the Land Office. McGarrahan thereupon obtained a mandamus, in the New York style, from the Supreme Court of the District of Columbia, directing the then Secretary of the Interior to issue the patent to *him;* but the mandamus was set aside, on appeal, by the United States Supreme Court, with a sharp rebuke to the judge who granted it. The examination was again ordered, and McGarrahan, at his wits' end, got a written request from the Chairman of the Judiciary Committee of the House, at the close of the session, asking the Secretary not to proceed with the examination, as the Committee had the matter under advisement, and there might be legislation on it. Moreover, to make assurance doubly sure, he went into the same court again at midsummer, and got an injunction, in the absence of the majority of the bench, to restrain the Mining Company and Secretary Cox, and everybody else concerned. Secretary Cox argued the return to this himself, and got it dissolved by the full court, and he then submitted the letter of the Chairman of the Judiciary Committee to Attorney-General Hoar, and asked him his opinion as to his duty. Here is that opinion:

> "First—That if, as I understand, the New Idria Mining Company are prepared to establish, to the satisfaction of your Department, their claim under the Statute of 1866, ch. 262 (14 Stat. 251), to receive a patent for certain lands in California, they have a legal right to have the question of their claim to such patent passed upon, such that your Department is bound to consider and determine the same, notwithstanding the request from the Judiciary Committee of the House of Representatives for a suspension of action. Their claim, as I understand it, is of a title to land created by law. If, under the law, they have this title, and are prepared to furnish the proofs of it, the law gives them the right to a patent, and the issuing a patent is not made discretionary with the Executive officers of the Government.
>
> "The question, then, resolves itself into this: whether, when a right is created by law, and a duty devolved upon an Executive Department under the same law, the enjoyment or enforcement of such right can be suspended at the request of a committee of the House of Representatives? I am unable to see that this result could be attained by any action, even of any of the whole House of Representatives, or of both branches of Congress, unless by a change in the law itself. To deprive any person of a right which the law creates, at the request of anybody, would be a novel idea under a system of government which is supposed to be a government of laws and not of men. If it were a subject depending upon your discretion, where you might properly regard all the equities of the case, and the probability that a decision at one time or another might affect them favorably or otherwise, the probability that Congress would take material action upon the question involved might well have an important influence in determining your action, and the suggestion of a committee of Congress or its chairman would be justly entitled to great respect. But it cannot be that any person can rightfully be hindered in the enjoyment of his legal rights upon the suggestion of a possibility that the law may, at some time or other, be changed.
>
> "I cannot suppose that the committee of the House of Representatives could have intended to ask you to delay your official action, except so far as it was a subject of your own discretion, and would not involve the denial of a legal right. The answer to your question thus depends upon the fact whether the New Idria Mining Company have a right to their patent under the law.
>
> "Second—The answer to your second question may be found in the suggestions already made. The Executive Departments have no right to omit or delay the discharge of the duties imposed upon them by law, at the request of a committee of the House of Representatives, and can only pay attention to such a request when it affects a discretionary power."

Secretary Cox's duty was then clear, to hear and determine at once, in the regular course of law, the application of the Mining Company for certain United States lands. To have denied their application at the request of a Congressman would have been a monstrous abuse, as Mr. Hoar points out. He therefore issued the following order:

> "You will, therefore, proceed in the ordinary course of business to take up and dispose of the application of the New Idria Mining Company for a patent, notifying McGarrahan or his attorney that the same will be done at an early day, to be fixed by you, prior to which time testimony or arguments may be filed by either party, and at the expiration of which period your decision may be rendered as your views of the law and the facts may warrant, and proceedings had thereon in the usual manner."

Ordinary men would in McGarrahan's place now have been in despair; but McGarrahan is not an ordinary man, and he has partners and backers in his claim who are not ordinary men either. So he, or they—it matters little which—go off to Long Branch, where the President was then enjoying himself, and induce him to write the amazing letter which they have recently had the audacity to publish. That letter, which the Queen of England, or the King of Prussia, or even the Emperor of the French, would not have dared to write, is despatched by the President from a fashionable watering-place, and without any consultation with his proper advisers; and, taking no notice of Mr. Cox's suggestion that he should come home and submit the matter to a cabinet meeting, directs the Secretary of the Interior to disregard the opinion of the Attorney-General, and to deny the legal right of an American citizen to have a lawful application passed on in a question of property by the proper officer, and to leave the whole thing in the hands of a committee of Congress which has no jurisdiction of it; and all this for the benefit of a party of persons who have been four times before the courts of the United States, and four times driven from them in disgrace. We do not believe the *Nation* has many readers who will find any further comment on this transaction necessary.

It is quite true that Secretary Cox did close his reply to this missive

Keep this paper between pages 324 + 325 of the Nation

all. The prospects of a session of considerable length are strong. If the two Houses once get started on business it will be hard to stop. Prominent Republicans would like to confine business to the one subject of Southern outrages, but the Democrats don't mean to allow that.

With regard to the Speakership of the next House, it is rumored that a combination of Republicans has required of Mr. Blaine as a condition of their support that he pledge himself to the appointment of Mr. Garfield as chairman of the Committee on Ways and Means, and that, thus far, he had declined to do so. The Democrats will bestow their complimentary vote either upon Gen. Morgan of Ohio, or Mr. Cox of New York.

Gov. Clayton telegraphs to Washington that in order to save the Republican party in Arkansas from going to pieces he resigns his seat in the Senate to retain the office of Governor.

Letter from Washington.

WASHINGTON, D. C., Feb. 25, 1870.

A ROMANCE OF CORRUPTION AND CHICANERY.

The Senate have refused so far to consider the joint resolution passed a week ago to-day, directing that the records in the General Land Office, known to be mutilated, and the patent which it is shown was fully made out in 1863 to William McGarrahan, and also withheld and mutilated, should be restored to the roll as they were on the 14th of March, 1863, and that the President then take such action as in his judgment he may deem equity and the interests of the United States to require.

The whole case of the United States vs. Wm. McGarrahan is one of the most remarkable transactions the history of judicial and legislative proceedings in this country has recorded. On the record the United States stands as plaintiff—a fact which speaks volumes for the shrewdness of the real operation—the New Idria Mining Company. It is a good thing for such a corporation to make the government bear the expense of defeating a man on whose land it is more than probable they are interlopers, while it is quite certain that whether McGarrahan or the United States are the rightful owners of the land claimed to be covered by the Panoche Grande Grant, the New Idria Mining Company had no title or any kind before the latter part of 1866, and since then could claim only the mining pre-emption rights of 4,000 feet for each of seven corporations, I think. But in all this fight the United States has been used to pull out the New Idria chestnuts. I have always hitherto been inclined to maintain the view Gen. Butler holds—that neither party are entitled to the lands—they being the property of the United States.

As the recent report, adverse to McGarrahan, made from the House Judiciary Committee, was framed and supported by Mr. Peters of your State, the matter, apart from its own merits, may have interest enough to warrant a

BRIEF SUMMARY OF THE CASE.

In 1844, the Gomez family obtained a grant, known as the "Panoche Grande," from the Governor of California. The records were destroyed with others, at Monterey. By the treaty of peace these Mexican grants were recognized. A commission was appointed to examine into them. Gomez in February, 1853 proved his title to the grant. The secretary of the Interior desiring him not to issue the patent, because the whole matter was before Congress.

Mr. B. The gentleman need not proceed further. I understand his question. I have opposed the present President as earnestly as any gentleman on this floor, and on this question, before I examined it, I was very much against him, taking the side of the Secretary; but after I saw that the President had only intervened to prevent the Secretary from granting patents to the New Idria Company until Congress had determined the question of right I became satisfied the President was right, and the threat of the Secretary to resign if he was not allowed, in defiance of the pending Congressional proceedings, to perpetrate this great wrong was unworthy of him. *I say that the act of the President was bold, manly, straight foward, and honest and I fully indorse and cordially approve his conduct in that regard* I am not partisan enough to refuse to do full justice to the President in such a case.

With the fact that the report of the majority is a purely one-sided affair, in which all is suppressed but what suits the conclusions, I leave the matter for consideration.

The vote of the House was a great surprise for the mining corporations and their attorneys. It was confidently expected that "Billy" McGarrahan would "come to grief."

HOW TO MANIPULATE A DOUBTFUL CASE.

It is conceded by all who are familiar with the House, that there are few men who equal the Hon. James B. Beck of Kentucky, in point of ability, and none who surpass his reputation for character and integrity—Democratic as he is. His advocacy of the minority report was a remarkably able argument and not at all smooth spoken in regard to the points as he saw them. He denounced the majority report for suppressing the facts that told for the petitioner, saying:

"Does the majority think that it is not worth while to tell the House that the docket-book and correspondence which would have proved McGarrahan's case in all probability had been abstracted from the Attorney General's office; that all the letters in the Land Office from January to July, 1863, covering the period when Mr. Lincoln signed the patent, had been stolen to prevent the truth from being proved? Do they think it unimportant to tell us that the circuit judge affirmed the finding of the commissioners on every point except the necessity of possession, and that the Mariposa case had settled that after their decision in favor of Gomez; that an appeal was granted to the United States March 15, 1858; that Goold had so informed Judge Black, by letter dated March 20, 1858; that the New Idria Company had no existence till January 28, 1858, and entered upon these lands without pretense of right, and with full knowledge of the adverse title? All these things are cautiously concealed in the report."

The New Idria Company, being in possession and working the mine, have been enabled to play the "Heathen Chince" with a vengeance, and stock the game. Ex-Attorney General Black, as well as almost every lawyer or good official, with whom McGanahan has had anything to do, or by whom his case could be affected, has turned up as in some way, before or after the time services were needed, as in the employ of the New Idria Mining Company. Dinner parties have been reduced to a scientific game in their behalf, while newspapers and correspondents appear to have been seen to a liberal extent. They could afford all this. The United States fight their legal battles and the mines supply them with the cash, necessary for those of any other kind.

What will be the end of the case is difficult to tell. It is claimed that a patent must issue to the New Idria, if this joint resolution fails, but if I understand Gen. Butler, it is for the United States to compel the Company as it

---

support, and carried the Government into a new and better
He has apparently succumbed at the critical moment. It is
t too late to retrace his steps. If he does not retrace them, we
ssure him that, whatever assistance he may get from the Forneys,
rons, and Chandlers, he may count with certainty on their bring-
im to the end of his term of office with a sullied reputation, and
ng him back to private life under a load of popular odium.

THE SYSTEM.

E publish in another column perhaps one of the most singular
of correspondence ever laid before a civilized public. It shows
gents of the party in power not only attempting to levy blackmail
this is what "assessments" on office-holders amount to—but
lly rating the office-holder's ability to pay not by the amount of
awful salary, but by the supposed amount of his stealings. Gene-
arlow's salary, as United States Marshal, was $6,000, and this was
hat he, as an honest man, could or did make out of the place: but
rs have made out of the place as much as $50,000. Indeed, in
itical circles," this is well understood to be the value of the office
a practical man." The Republican State Committee last year,
ver, while flooding the State with stump speakers to inveigh
st Democratic corruption, and declaim about the economy, honesty,
efficiency with which the revenue was collected under Republican
ces, were actually sending round circulars in which thievings were
nized among the legitimate gains of a Government servant, pro-
l he paid his party dues upon them.
the particular case before us, the Committee happened to light
one of the class of officials for whom the President, in the early
of his administration, showed an honorable and hopeful predilection
aking his appointments—a man who served the country in peace
served it in war, because he loved it, and not because he was unfit
ny other occupation, and who held that the moral obligations of a
ernment official are the same as those of a man in any other position
fe. Accordingly, he resisted the attempt at extortion, and, the
for it having apparently arrived, lays the matter before the public.
We do not mean to say that all the members of the committee are
onsible for this singular transaction. Most of them probably know
ing about it; but during all canvasses the real work is left to a
men in each district, who are trained in all the dodges of the out-
ous system which has bred and supports them, and whose great
e to the party lies in their not sticking at trifles. The nauseating
ct of General Barlow's letter on these worthies, when they got it,
be more readily imagined than described, and, in fact, they gave
ng expression to it by sending the letter back. His "mawkish
eptibility," as Colonel Forney calls it, must have struck them very
h as a lecture on chastity would strike a French Zouave. But
e was probably not another official in the State who dared offer
resistance; and when we see that the income of $6,000 is levied on
f it were $50,000, it is hardly possible to keep down a feeling of
sement at the way in which the American people are cheated by
figures set down in the acts of Congress and of the State legisla-
s into the belief that their officers are only paid small salaries, and
he storm of opposition which the honest farmers raise against any
mpt to increase the nominal amount of these salaries. The fact
hat the office-holders of the United States are not only paid higher
es than those of any monarchy in the world, but receive the greater
of them in a way that does more to corrupt them, body and soul,
to sap the national morality, than all the sinecures, "gratifica-
s," and pensions bestowed by poor Badinguet did to corrupt and
ase the unfortunate people who for eighteen years owned him—
n-politician as he was—for their master.
This system of assessing officials for election expenses, though it is
y this year that it is generally attracting public attention, has been
ng on for a long time. What suffering it has imposed on the un-
unates whose salaries are small and opportunities for stealing
ited, it is difficult to estimate; and what a stimulus it has given to
aling amongst those who have ready access to the public funds or
ose powers make them worth bribing, it would be just as difficult to

estimate. But we know that it has converted the public service into a sink of corruption, the abominations of which have never been fully exposed. If they could be fully exposed in a way that would bring the whole people to examine and understand them, we believe there would be an outburst of indignation that would sweep them away, and their authors with them, in a single month. The newspapers are generally believed to exaggerate most of the abuses they denounce, but we say deliberately that no denunciation of the condition of the civil service of the United States which has ever appeared in print has come up, as a picture of selfishness, greed, fraud, corruption, falsehood, and cruelty, to the accounts which are given privately by those who have seen the real workings of the machine. The reason why "the men inside politics" are amazed at honest men's indignation over it is that they are literally hardened to it—as criminals are hardened to crime; and the reason why the general public is so little shocked by what even they see of it is, that they have so long been assured by party leaders that this system is a necessary part of party governments, and that there has to be a class of office-holders to be "rotated," and decapitated, and levied upon in a democracy (just as, according to some, there have to be prostitutes for the protection of female virtue), that they have at last got to accept it as a great political truth.

Of course, the system of assessment is a necessary consequence of the rule that "to the victors belong the spoils." If Government officers are the servants of the party and not of the country, and if the party is at liberty to use them not for the benefit of the country, but for its own, making them pay bonuses every year for the privilege of keeping their places is legitimate enough. We cannot put a stop to it unless we take away, *by law*, from the victors the right of removing any officer except for cause, or appointing anybody who has not undergone a prescribed test of fitness. We cannot trust the matter to any President or to any head of department. Both are liable to be overborne by the politicians. An act of Congress was passed in 1853 providing for the examination of persons appointed in the departments, and a more delightful example of "how not to do it" was probably never seen than its working. The character of the examination is left to the head of the department or bureau; if he desires the admission of the applicant, it is a perfect farce; if he does not, it is very severe; if he disapproves of examinations altogether, it consists in a chat and a smoke. But, in point of fact, the act has only been enforced fitfully, and at long intervals. The appointments are made, just as of old, on the requisition of members of Congress. Mr. Trumbull says some of the latter have regular accounts in "offices" opened with them; if the candidate fails to pass the examination, he still remains a clerk, though not appointed to any particular bureau, draws his pay, and does odd jobs, mostly political. It is Mr. Cox's making the system a reality which has drawn forth the shouts of rejoicing over his retirement from the political hacks all over the country.

One of the practical effects of the system has just been displayed in a curious way in this State. The smallness of the Republican vote as compared with former years, even in good Republican districts, is ascribed by the best judges in a great degree to the hostility of the Fentonites, who, disgusted by the appointment of Tom Murphy, who is a Conklingite, to the custom-house, and other slights and disasters undergone by their chief, stayed away from the polls. Now, why are the Republicans of this State divided into Fentonites and Conklingites? Why is the party torn to pieces by the contests of these chieftains? Why is every convention and committee a mere reservoir of Conklingite and Fentonite hates? The fact is that the two factions are not divided by any question of principle or policy any more than any two women who quarrel on the staircase of a tenement-house. There is no point of politics, home or foreign, on which they or their followers have any perceptible difference of opinion. The only reason why there should be Fentonites and Conklingites is that Fenton hates Conkling and Conkling hates Fenton. But how is it, the innocent looker-on will naturally ask, that a ridiculous personal feud like this can divide a great party, composed of male adults, in the latter part of the nineteenth century, and in a great commercial State, into two hostile camps, and cause them deliberately to imperil the "cause of the Union" and the "cause of humanity," about which they prate so much as the dearest and most important of earthly interests? Their reply is, or should be:

"My dear Simpleton, at the bottom of the whole matter is offices. Long seclusion in your library, or else a seafaring life, has doubtless prevented your giving your attention to the manner in which God Almighty, when he made republicanism his appointed order of government, ordained that the machinery of administration should be worked. Know, then, that if Fenton could get no offices for anybody in post-office or custom-house, he would, when he took the field against Conkling, take it alone. Grown men would laugh when he asked them to stand by his side and be 'his friends' in this great struggle. In like manner, Conkling, though a far abler and honester man than Fenton, would likewise find that when he raised his banner he would have to stand under its folds by himself. People would be too busy to 'work for him' against any of his foes. So he and Fenton would go off to Washington, and, having nobody to 'see' about places, would devote themselves to what is called the study of the public business—as if politics needed 'study'—dull and stupid work, too. But each having some hundreds of offices to bestow on 'his friends,' in case he makes his influence in State politics so plain that the Administration feels bound to court him, their conflicts make one of the most exciting little games ever witnessed. Thousands 'rally round' them on one side or the other. The custom-house and post-office become fortified posts, which are carried now by one and now by another, and, finally, the whole politics of the State get drawn into the fray. To be a New York politician, you have not to understand the Constitution, the history of legislation, the finances, political economy, and statistics, but to love or hate Conkling or Fenton, and to know which of them 'owns' Smith, what Brown said after seeing Fenton last week, and how things are looking in Schoharie County since Conkling took those oysters at the Delavan House with T. P. Comstock. Good-night, you poor donkey."

ENGLAND.—THE NEW SCHOOL BOARDS.

LONDON, October 27, 1870.

A SUBJECT which is exciting a good deal of interest here at the present moment is the election of a Metropolitan School Board. The general effect of the legislation of the last session, as I may venture to remind you, was as follows: Certain returns were to be made from every part of the country, showing the extent to which education is already provided. When they have been received, school boards are to be formed in order to supply existing deficiencies. Now, although we are still rather in the dark, it may be said that in a general way there is a sufficient provision for elementary schools in most of the country districts—sufficient, that is, if the children could be induced to go to them early enough, and stay at them long enough. In most of them, very little alteration will therefore be produced. But the case is, of course, very different in the great towns. There it is sufficiently notorious that the schools are altogether beneath the requirements of the population, though it may be doubted whether they would be filled even if they were provided. For this purpose, some sort of compulsion seems to be absolutely necessary. Meanwhile, it was decided that the great towns should be allowed to start school boards at once, and that London, in particular, should elect a board with the least possible delay. The elections will take place in the course of next month. Now, the experiment is so novel that considerable difficulty is felt in forming any estimate of the probable character of the board. Perhaps I shall give you the best idea of some of the obstacles in the way, by describing a meeting which I recently attended in one of the metropolitan boroughs. In some respects, they will be familiar enough to your readers from their own experience; in others, they may see the special perplexities which attend the introduction of a new system in an old country.

The meeting in question had been summoned by a committee, appointed by no particular authority, with the laudable object of selecting the best possible names, irrespective of sect, party, or social standing. They had nominated four gentlemen, one of whom was known for his activity in educational matters, two others had a certain local reputation, and one was the representative working-man. The room was crowded by a respectable audience of about five or six hundred people. When I entered, it was in that state of hopeless confusion which generally testifies to the presence of an inefficient chairman. Some half-dozen gentlemen, in a state of intense excitement, were on their legs at once. A large number of other enthusiastic persons were venting their feelings by indiscriminate yells of applause to the rival orators, or frantic appeals to the chairman to preserve order. Let me endeavor to describe, shortly, one or two of the most prominent types. Before me, there stood the solid, impenetrable British tradesman, broad-shouldered, imperturbable, a very Atlas unremoved in the midst of the conflicting elements. He was speaking with a dogged persistence which enabled a few of his sentences to secure at times the attention of his audience; and the point which he urged with obstinate emphasis was the importance of assigning a special representative to each of the districts of which the borough is composed. A vigorous barrister was meanwhile boiling over with irrepressible impatience. Whenever the gaps between our friend's sentences were rather longer than usual, he sprang to his feet, or, rather, seemed to be jerked on to his legs by some hidden machinery. When at length he obtained a hearing, the only words audible were, "hole and corner," to which I presume "dictation" would have been added but that a roar of indignation drowned his voice, and, as I gathered, some sudden force was applied to his coat-tails. To him succeeded a clergyman, tall, black-coated, white-tied, and eminently respectable. I have every reason to suppose that he would have said something about the Bible; but his eloquence was interrupted by one of his brethren, who insisted upon carrying on a loud conversation with him from a distance of several benches. The result was that, beyond the fact that the clergy were exceeding anxious about something or other more or less connected with the Bible, nothing could be clearly ascertained; for, as they still strove for utterance, the genuine parish orator rose to his legs. He was a man of overpowering volubility of speech, and might have made some useful contributions to the discussion, if he had not unluckily chosen to begin by demonstrating the advantages of education to mankind in general with some eloquent digressions as to the merits of the Sermon on the Mount. He, too, collapsed, though, long after the yells of impatience had drowned his voice, his graceful postures testified to the fact that the stream of eloquence was still being discharged upon the empty air.

Then arose a gentleman who fairly eclipsed all previous performers in the energy of his attitudes. My memory paints only a wild confusion of arms and legs, in which his head somehow entirely disappeared, and shrieks of inextinguishable laughter drowned any sounds that he may have uttered. This remarkable discussion in dumb-show apparently wearied the audience, as it certainly wearied me; and we at length collapsed into partial silence to listen to the candidates themselves. Of them in general there is not much to be said. They all spoke with commendable fluency, but kept so carefully to the obvious commonplaces of the question that it required some attention to perceive that some were appealing entirely to the religious prejudices of their hearers, whilst others were counting more upon the advocates of unsectarian education. The working-man was amongst the most fluent of the party. He was evidently a man of much natural ability, and of considerable talent as a speaker. Unluckily it was impossible to listen to him without seeing that his ideas partook of that vagueness and impracticability which is common with partially educated men. His great argument appeared to be that, if we provided good schools, we should produce quantities of Bacons, Shakespeares, and Lockes. The meeting did not seem to be quite convinced that this consummation, desirable as it must be admitted to be, was to be anticipated with any degree of sanguine hope. It was more interesting to observe that he, of all the candidates, was most profoundly convinced of the necessity of compulsory measures. If he was a faithful representative of his class, we may assume that compulsion will be vigorously applied. I believe, indeed, that the more thinking class of working-men are perfectly awake to the necessity of such a course if the new schools are to be made of any great use. Whether it will be practicable to carry out the policy, or whether the first appearance of a policeman may not prove to be too much for the temper of the ordinary laborer in London, is another and a much more difficult question. The propriety, however, of compulsory action excited remarkably little interest. As the working-man retired from the platform, two or three schoolmasters arose in different parts of the room, and put, or tried to put, the question, whether he was in favor of teaching the Bible. They were so energetic in demonstration and cried out so vigorously that they would not be content with an evasive answer, that answers of any kind became impracticable. The whole meeting became for a few moments what is forcibly called a bear-garden, and, before any satisfactory conclusion could be reached, another candidate—this time a High-Church president of a training college for schoolmasters—was addressing us. He had the merit of being obviously far better acquainted with the details of the subject than any of his predecessors, and the demerit that he told us a little too plainly, by words and manner, that we were, as a general rule, shamefully ignorant. The meeting, however, had by this time got into such a feverish state of impatience, and there seemed so little prospect of a tolerably satisfactory result being elicited from such materials, that I thought it useless to expose my lungs any longer to the deleterious atmosphere, and retired reflecting profoundly.

The result of my reflections may be shortly summed up. In the first place, it is obvious that sooner or later the religious difficulty will come pretty distinctly to the surface. The jealousies of the rival sects are so strong that it will require the utmost tact on the part of the proposed school board to avoid any serious difficulties. They have, it is to be remarked, considerable latitude of choice. The one condition laid down by Parliament is that the schools are not to teach any formularies or catechisms distinctive of any religious sect. As the Bishop of Peterborough lately put it, it is forbidden to teach the children to say, "I believe in God," because that is a religious formula; it is not forbidden to teach them to say, "I do not believe in God," because that is a formula which has not yet been adopted by any particular sect. Of course, this is, and is meant to be, an extravagant way of expressing the difficulty; but the fact that one of our most distinguished prelates should illustrate his case by such an example shows how very distrustful will be the attitude of the strongest educational bodies. It is true that the difficulty may not turn out to be great in practice; and I imagine that most reasonable men would prefer seeing our street-children brought up to any conceivable form of religious belief to seeing them left in their present state of complete ignorance of all religious knowledge. That, however, is no reason why rival sects should not strive to get the command, as much as possible, of so powerful an engine, and the warmth of their contest will be measured much more by their mutual animosity than by the value to any of them of the prize at stake. Here, then, there is a palpable rock ahead which will probably cause trouble in future, and which is already exercising an injurious influence by dividing the efforts of those who might succeed, if united, in electing the most competent administrative body. The worst danger, however, is one which I suspect that you will be able to appreciate. It is that, whilst different parties are quarrelling over anticipated difficulties, and every little faction insisting upon the acceptance of its own shibboleth, the practical control of the system may fall into the hands of our parochial politicians. They have shown in their dealings with the poor-law and other affairs entrusted to their control such singular facility for every variety of mismanagement, overstrained economy in some districts, and downright jobbing in others, that it would be a serious misfortune if they got the new schools into their hands. The solid gentlemen who insisted on the rights of their own districts seemed to me to be rather dangerous enemies to their more enthusiastic opponents. We shall soon be able to judge by the event. Meanwhile, I am glad to say that, in spite of some ugly symptoms, there is also considerable promise. Many eminent men have come forward, as, for example, Lord Lawrence in this part of London, and there seems for the present to be a very general desire, in spite of much discordant opinion, to elect a board pledged to carry out its duties vigorously and in a good spirit.

AN AMERICAN SURGEON IN THE PRUSSIAN SERVICE.

Cassel, October 4, 1870.

It may, perhaps, interest your readers to look a little at the Prussian army in a surgical point of view; and, as I have recently come from the scene of active operations, and have had some opportunities for observing the workings of the military hospitals and the various appliances and appointments directed to the saving of life which war makes necessary, I send you a brief account of some things I have learned and observed.

These days of breech-loading rifles and murderous mitrailleuses have proved clearly that a change and an augmentation of the surgical forces of armies are required, and that the old quota of surgeons, apportionment of assistants, and allowance of supplies can no longer meet effectually the increased demand for their services in the care of sick and wounded soldiers. The Prussian army in a battalion of infantry (1,000 men) has two surgeons. There are, consequently, six surgeons in one of its colossal regiments of 3,000 men, or one surgeon to every 500 men. In the cavalry and artillery, the proportion is somewhat greater. A regiment of cavalry (about 600 men) has three surgeons; a battalion of artillery (about 500 men) has also three surgeons. This has always been considered a liberal equipment; but the field-hospitals, in the terrific battles which succeeded each other, with scarcely an interruption, from the 4th to the 31st of August, have been found, as all the world knows, wofully inadequate; and the fact that there are at the present moment more than 200 extra surgeons added directly to the army, as well as an innumerable swarm of volunteer surgeons and assistants of every degree of importance and usefulness, shows how great the deficiency has been. Private Prussian practitioners of skill and repute have been induced by the solicitation of the Government as well as their own humanity to join the army, and high special commissions have been created for them. I met in the hospital where I was engaged at Pont-à-Mousson, German, English, American, Austrian, Swiss, and Russian surgeons. The Swiss Government sent thirty of its own army surgeons to the field, fifteen to the German and fifteen to the French side, and valiant service they performed during those terrible days in August when the world stood amazed at the unprecedented slaughter.

The total number of surgeons at the present time employed in the army approaches 3,000, while it is ordinarily less than 2,500. An army corps of 40,000 men has sixty surgeons and provision for twelve field-hospitals, each accommodating 200 men, and supplied with five surgeons, about thirty *Krankenträger*, or bearers of wounded, and a proportionate number of nurses, assistants, ambulances, and carriages of supplies. Each field-hospital moves with the army, and is charged with the care of the wounded as they come directly from the field. One-half of the surgical force station themselves in action directly in the rear of the army, and do for the wounded whatever immediate emergency may require before they can be sent to the second station, which is more permanent, and where large operations are performed. Here blood flows freely, and suffering is dire; and the red blouse with which the surgeon envelopes his uniform is sadly significant in its hue. The remainder of the surgical force of each field-hospital is here employed, and here the wounded are retained until their removal is dictated by prudence or demanded by necessity—more often the latter; for after many of the recent battles there has been no possibility of finding shelter or beds for the wounded still lying on the field, until some of the neighboring buildings used as hospitals (churches, barns, farm-houses, or inns) could be evacuated by the transportation across the country, in trains of open wagons, of all soldiers whom it was possible to remove. The cold and rainy weather, of which we had so much, made this journey doubly painful and disastrous; and the number of wounded soldiers who have breathed their last upon the straw, jolting across the country in those wagons, if it could be exactly known, would form a sadly eloquent commentary on the sanitary and surgical supplies of the army. Nothing, however, is to be said in disparagement of the merits of the army surgeons: their zeal and ability are too well known to need any confirmation from my pen, and the misfortunes of the wounded were such as no human foresight could have anticipated or prevented. Moreover, as we cannot flatter ourselves that the days of the world's wars are yet over, we have the satisfaction of knowing that a rich lesson has been learned whose value in advancing military surgery the future will show.

In speaking of the army surgeons of the Germans, I must pay my tribute of respect to their profound science and skill, as well as their courage and *esprit de corps.* Let such men as Langenbeck, Strohmeyer, and Roser represent the former, while each member of their body is an example of the latter. They have almost universally discarded the red cross of the International Convention, scorning to be considered non-combatants. One of their assistant-surgeons, as he was succoring the wounded on the battle-field of Wörth, received a stray ball through his eye. He coolly took out his handkerchief, and, binding it over the wound, proceeded with his work. When he had completed in an orderly manner his care of the wounded man who was engaging his attention, he gave him to the charge of his *Krankenträger* and returned to the hospital, where it was found that his eye had been completely destroyed. He was rewarded for his intrepidity, and perhaps as well for the loss of his eye, by the reception of the decoration of the "Iron Cross" from the hand of the King.

You will perhaps allow me a few words on German operative surgery and surgical appliances as compared with those of our own country. The Germans are pre-eminent in deep investigation, skilful theorizing, and thorough information; but I endeavor to be perfectly candid when I say I have seen nothing which led me to think less highly of the surgeons and the surgery of America. One who has seen and studied practical surgery in any of the chief American cities will look in vain for the order, the skilful manipulation, the rapidity and brilliancy to which he is accustomed at home; and these are not compensated for by any diminution of the sufferings of the patient or increase in his safety. The operating-room, during the performance of an operation, is a sort of Babel. The preliminaries do not seem to have been arranged, the instruments are beyond the reach of the operator, and no one person is charged with the duty of handing them. When he calls for an instrument, several of the bystanders simultaneously attempt to comply with his request. Those who look on discuss the various steps freely and in loud tones, and offer any suggestions that occur to them. Their instruments, though made of far finer material than we get in America, are clumsy in appearance and construction, and awkward for the hand. The American models of the more common instruments exceed them by far in elegance and neatness. They know little concerning many convenient, ingenious, and tidy contrivances which are considered indispensable in England and America; and it is amusing to see the lofty indifference with which they listen to any suggestion of the possibility of methods or apparatus superior to their own; for there is in the average German disposition the least perceptible leaning toward illiberality when other countries, as compared with Germany, are in discussion. A comparison of the hospital wards of the two countries in the respects of convenience, neatness, and order would result favorably, I am certain, for America. Indeed, they concern themselves little about externals in surgical matters, while these necessarily engage the first attention of the observer; and for this reason this first impression is the most unfavorable; yet, if one looks more closely and studies a little deeper he finds that the essentials are never neglected, and that the *results* are perhaps all that could be expected.

I say all this after making every allowance for the exigencies of war in the enemy's country, and I do not speak of surgeons or hospitals that are exceptional, but of men of the highest reputation, and the hospitals under their charge, in the large towns of France like Pont-à-Mousson and Nancy, where every facility is at hand for furnishing completely the hospital and providing amply for the care of the patients. And there is now no longer any lack of provisions of any sort for the welfare of the wounded. The depot of supplies, under the direction of the Johanniter Ritter Society at Saarbrücken, has been enabled, by the liberal contributions from every part of Europe, as well as America, to meet every demand for materials required by the hospitals in the vicinity of Metz, which were at first so numerous and so crowded. The Sisters of Mercy attend fully, faithfully, and without intermission to the care of the patients. The number of surgeons and assistants of all sorts who have volunteered their services is even superfluous. The wounded are now being comfortably removed in large numbers to the reserve hospitals established in almost every city in Germany, and we begin to rejoice in the hope that the calamitous scenes of blood and suffering are over, although the sad reflection forces itself upon us that the most frightful suffering of the war is not physical, and that the deepest wounds it has inflicted are past all human surgery.

October 17, 1870.

In the two military hospitals with which I have been connected—one in France and one in Germany—I have made such observations as will, perhaps, enable me to give your readers some idea of those institutions as the present war has brought them into existence. I accordingly send you a brief account of some things I saw during my late connection with the hospital of the "Séminaire" at Pont-à-Mousson, and of some things I am now seeing here every day in the Royal Reserve Hospital No. II., at Cassel.

Early in September, as I rode into Pont-à-Mousson one dark, rainy evening, having come across the country that day from Rémilly, I noticed, as I crossed the old stone bridge which here spans the Moselle, a large church a short distance to my right, from whose spacious windows lights were shining. It was late for evening service, yet, thought I, perhaps this afflicted people are prolonging with unwonted ardor their supplications for divine mercy, or are rehearsing some *Miserere* or *De Profundis* with a new sense of the meaning of its lamentation. The next evening I learned better, for I joined until midnight in the services held at that church. The audience was composed of about 500 soldiers, French and Prussian. The ceremonies were directed by half a dozen surgeons, a force of Sisters of Charity assisting at the mournful rites. The sermon was uttered by a thousand tongues, speaking from the mangled flesh of those injured men, and was a powerful discourse on the present status of Christian civilization, from the text, "Peace on earth, good-will toward men." For music, we had the groans which their sufferings extorted from those wounded soldiers; sweet incense was replaced by the odor of foul sores; and, instead of a benediction from the lips of the man of God, one could almost think Satan had pronounced from the organ-loft the curse which Longfellow somewhere puts in his mouth—

> "Maledictione perpetuâ
> Maledicat vos Pater Æternus!"

This church was a fine, large structure in the renaissance style of architecture, built side by side with an institution of similar style and dimensions, the two being connected front and rear by spacious wings, with corridors traversing their length, and porticoes opening upon the handsome court thus enclosed. The whole, known as the Séminaire, formerly a flourishing Catholic divinity school, was now converted into two immense field-hospitals, accommodating nearly 1,000 patients. When the Prussians took possession of the town, they found this spot deserted, pupils and professors alike having withdrawn to a safe distance, leaving accommodations of every sort requisite for hospital purposes: large, airy dormitories furnished with beds; apartments for surgeons and officers and nurses; complete housekeeping appointments; a handsomely laid out garden, with a beautiful arbor which it required little trouble to convert into a morgue (certainly not one of the "sweet uses of adversity"). Many of the windows commanded a fine view of the Moselle (which ought now perhaps to be spelled "Mosel"). In the court, pavilions were easily erected for the accommodation of contagious or infectious cases; indeed, it required only a few hundred mattresses to make up the number of beds, and the hospital was ready for its inmates. And the inmates came quickly enough, too. Pont-à-Mousson was then a centre of hospitals as now of military movements, and from all the battle-fields to the south-east of Metz the wounded were brought for weeks in an almost uninterrupted succession of wagon-trains. The result was something like eight field hospitals and five or six field dispensaries in that town of not more than 10,000 inhabitants, all employed to the utmost extent of their capacity.

In the church of the Séminaire before-mentioned, a large part of the wounded were first received. The floor was thickly spread with straw, the best available bed, and upon this they were temporarily disposed. Often when they arrived in trains of hundreds at a time it required the whole night to attend to their comfort; the church was so filled that in going down the aisles one could scarcely find a path among the disabled men as they lay crowded together on every side, and the halls and porticoes of the wings as well were packed to their utmost extent. From the church they were distributed as their cases required: the transportable were sent backward to the reserve hospital of Germany, the more severe cases retained in the Séminaire, the internal diseases assigned to their appropriate localities, the contagious to the pavilions, the French to the straw on the floors of the halls, as there were no longer beds for all, and to the Prussians belonged the first choice. The wounds of the Prussian soldiers, inflicted upon them by the chassepôt rifle, were remarkable for the straight and uncompromising lines which they presented. When arrested at point-blank range, the missile of that weapon takes a straight line through and through whatever objects come in its way; thus I have seen wounds through the *width* of the hand, the ball entering on one side and passing out on the other, shattering every one of the five bones in its course; wounds through both thighs, fracturing one of them; wounds through all the bones of the pelvis, as well as through all the bones of the face and skull, each of them made with the most undeviating directness, and turning neither to the right nor the left. Indeed, the Prussians themselves acknowledge the superiority of the chassepôt arm, and have equipped a regiment of their own with a *few* of those at present at their disposal.

In the hospital of the Séminaire, the duties of the nurse were left exclusively in the hands of the various orders, Protestant and Catholic, of Sisters of Mercy and Charity. In the church and in the lower rooms of the seminary, Sisters of the Society of Jesus, from the Rhine provinces, and Sisters of the Order of St. Franciscus, from Westphalia, were employed. The Jesuit Sisters all speak French, and were hence best employed in the care of the French soldiers, who were at first almost equal in number with the Prussians. In the upper rooms, the Protestant deaconesses from Berlin and the different parts of Rhenish Prussia had the care of the wounded, and the intelligent and faithful manner in which they each and all discharged their duties, as well as their excellent influence in the wards, need scarcely be expatiated upon here. In the medical conduct of the hospitals of the present war, drugs have been largely ignored. It has been the chief business of the dispensaries to furnish disinfectant, palliative, and hygienic measures, while the restoration of health has been left almost entirely to the unembarrassed efforts of nature, and this with the most encouraging results, I am happy to say. The statistics, as a whole, when they shall appear, will have great and deserved weight in doing away with the almost superstitious veneration of drugs which still exists among the people, and even among the doctors as well. This I say from seeing how drugs are dispensed with in the Séminaire, while good food, good light, good air, and good nursing were insisted upon, and from knowing how generally this was everywhere the case. The number of the operations made at this hospital was immense. Scarcely a day passed on which three or four capital operations—amputations, resections, ligations—were not required to be done. The largest of these were done personally by Prof. Roser, a surgeon of wide reputation from the University of Marburg (who, I see, has just been ordered as consulting surgeon to the royal headquarters at Versailles). The unfortunate subjects of these have not done well as a rule, and for reasons not far to seek. They came here after the most favorable time was past, having lain for days or weeks near the fields where they fell, in whatever farm-houses or barns or sheds room could be made for them, and insufficiently cared for in all ways. Hence, although they here had the benefit of whatever skill and care could do for them, their progress was unfavorable, and numbers of them were carried off by one or another of the pests which prey upon humanity in war-time in field hospitals.

The levity displayed by some of these French soldiers is greater than I could have believed, and diminishes my wonder at their overwhelming defeats. When recently, in the church, it was desired to separate a little the French and Prussian wounded, who lay side by side and often could not be discriminated, the question was put as to their nationality, and many of the French soldiers replied in a tone half-jesting, half-sycophantic, "*moitiê français, moitiê allemand.*" I will say, however, that when, afterwards, I endeavored to ascertain what soldiers had given this answer, I came to the conclusion that many of them were either thoughtless boys or indifferent Algerines.

R. S. D.

HOW THE THING IS DONE.

THE following correspondence, which explains itself, was begun by the receipt by General Barlow of the usual printed circular, calling for money towards the election expenses, the blank space for the amount being filled in with the words, "$1,000 for yourself and subordinates":

"NEW YORK, October 20, 1869.

"JAMES B. TAYLOR, Esq., Treasurer, etc.:

"DEAR SIR: I have received a communication from Hon. Hamilton Harris, chairman, etc., requesting a contribution of $1,000 from me and my subordinates to the Republican fund.

"I presume this amount was fixed upon under the impression that this office was very lucrative to me and my deputies. My income from the office can by no possibility exceed $6,000. The general rate of assessment on salaries I understand to be two per cent., and I enclose my check for $120, being at that rate. Whether in or out of office, I am desirous of contributing whatever I can afford to the necessary and proper expenses of the party, and I regret that I can now only afford to give this amount.

"As to my deputies, they must each contribute such amounts as they feel able to do. I cannot impose it upon them as a duty, and I cannot undertake to *collect* anything from them. I have submitted the communication to my subordinates, and you will no doubt hear from them.

"Yours, etc.,
"FRANCIS C. BARLOW, United States Marshal."

"Room E, Fifth Avenue Hotel,
"NEW YORK, October 23, 1869.

"Maj.-General F. C. BARLOW, United States Marshal:

"DEAR SIR: I am in receipt of your communication of 20th instant, to James B. Taylor, Esq., treasurer, enclosing check for $120.

"The great discrepancy between the amount of the check and the amount asked for by the committee would render it, in the opinion of the committee, an act of great injustice to the other Government officials who have already responded to the calls made upon them, to accept in its present shape your contribution. I therefore, by order of the Executive Committee, return the check to you, expressing the hope that you will reconsider the views expressed in your communication.

"Very respectfully, your obedient servant,
"JAMES W. HUSTED, Secretary.

"P. S.—The assessments made upon the Government officials in the State are *not* made upon a basis of two per cent. upon their salaries, but upon the ascertained income of their respective offices. J. W. H."

"U. S. Marshal's Office, Southern District of New York,
"NEW YORK, October 23, 1869.

"Hon. JAMES W. HUSTED, Secretary Republican State Committee:

"DEAR SIR: I have received your letter of this date returning my check for $120, on the ground that the acceptance of it would be an act of injustice to the other Government officials who have contributed more liberally. You also express a hope that I will reconsider the views heretofore expressed by me in the premises.

"I cannot afford to contribute a larger sum than the one I have named, and that I may not seem discourteous to the committee I desire to explain why I cannot change the views heretofore expressed.

"I do not consider that the holding of a public office creates any obligation on my part to contribute anything, and whatever I do give is not given on any such ground. As a private citizen interested in the success of the party, I have always been desirous of giving what I could towards its proper expenses; and were I out of office I should give more now, because I could better afford it. Any person who holds public office in this country, and gives all his time and energy to it, I consider underpaid if he receives only the honest salary of his place. I know that *I* lose money every day that I am Marshal, and for that reason I shall shortly resign. The fact that I am working for the public for a less sum than I could earn in my private business is rather a reason why I should be *relieved* from assessments than why I should *pay* them, and this applies, in my opinion, to all public offices that I know anything about—they are all underpaid.

"You speak of the 'ascertained value of my office,' as distinguished from its salary, which is only $6,000. I do not know from where you ascertained its income; but I do know that whoever has received more from it than $6,000 per annum has not received it honestly. I should be sorry to believe that dishonest gains of public offices were so recognized and accepted as matters of course that they are made the basis of expected contributions.

"What I have said here will also explain why I cannot impose on my deputies the payment of contributions as a duty. They fully earn every penny they receive, and I cannot recognize the *right* of the Government or the party to call on them for any sum whatsoever. I presume, however, they will gladly contribute what each feels himself able to do. I make this explanation with entire respect for the views of those gentlemen whose opinions on this subject differ from mine. My views may seem Quixotic and unreasonable, but I am firmly impressed with their soundness, and we must all act upon our own views of what is right. The check for $120 is at the service of the committee if they feel that they can accept it.

"Very respectfully, FRANCIS C. BARLOW."

This last letter was returned to the writer without observation, and the check never called for.

Correspondence.

GERMANY AGAINST FRANCE.

TO THE EDITOR OF THE NATION:

SIR: Agreeing in every respect with the letter of Mr. G. Schwab to you, I beg leave to make a few remarks concerning the annexation of Alsace and Lorraine.

The position assumed by you that the annexation is not a question of *right* in the strict sense of the word is, it seems to me, incontrovertible. France has forsaken every claim to have the great problem of her "natural limits" solved by any such considerations. Without the least provocation, she has appealed to the law of *force*, and she has to abide the consequences. The other great powers have made no serious attempt whatever to keep her from putting up the laws of this code—this true *Code Napoléon*—as the *ratio* by which the quarrel of 350 years' standing ought to be decided; therefore there is, evidently, no power on earth which has the least particle of right to take sides with her, simply because the judgment has—unexpectedly to most people—turned against her. *We did* stand on the basis of right, as far as she was concerned; she forced us from it, and now it would be suicidal for us and a never-to-be-forgiven crime against our brothers, who are buried in her fields, to act on the supposition that the Holy Scriptures and the Catechism will henceforth be her political textbook. "Nous n'avons pas été préparés!" Is it already forgotten, this ten-times-repeated cry of anguish of the "great" Thiers? That is the only atonement France has thus far offered for this wantonly provoked war. Now that we have the power, it is our *sacred duty* to take care, as far as possible, that she never again *can* be prepared to let loose the barbarians of Africa against the peace-loving inhabitants of our border provinces, because her *sensibilité* has not been heeded enough, or because she wants to change the face of the actual world according to the fancy maps she has been pleased to draw. We need no beautifying veil for the wrongs committed by Frederic II. against Poland, and no extra paint-box to give the annexation of Alsace by Louis XIV. a darker color than we bestow upon all other unjustifiable conquests recorded in history, in order to justify our demands. Against our will and most solemn protest *force* has been declared to be the law of the day, and now we mean to stand by the consequences just as far as it suits *us*, and not as it suits Mrs. Howe, or Wendell Phillips, or George Francis Train, or Garibaldi, or Victor Haut-Goût, as *Kladderadatsch* says; and it suits us to take Alsace and Lorraine. "That is what is the matter."

The only question at issue, I think, is how much or how little the rest of the world ought to be pleased that it is this which suits us. As far as Alsace and Lorraine themselves are concerned, I think you are not right in putting so great stress on their present state of feeling. They are now, and they will be for some time to come, in a fever-heat. Give them a few years to cool down, and then we will ask them again. The South went mad on Lincoln's proclamation of emancipation. Ask now those of the fire-eaters who have any intelligence if they would want slavery back if they could get it. Alsace (and Lorraine still more so) is certainly strongly attached to France, and not without reason, because France has done away with the feudal rubbish which was lying there in vaster heaps than anywhere else. On the other side, however, she is much more closely linked to Germany than is generally supposed. From time immemorial she has been of the greatest moment in the development of the intellectual life of Germany. Gottfried, the greatest poet of his times (twelfth and thirteenth centuries), was from Strasbourg. All or almost all the heroes of mysticism, as Meister Eckart, Tauler, Nicolaus, Geiler of Keisersberg, as also Spener, the founder of the pietistic school, were Alsatians. No other part of Germany can boast of so many satiric poets of the first order. You remember Sebastian Brant, Thomas Murner, the immortal Fischart, Pfeffel, etc. And even in our days she has not lacked poets of note. I mention Hirtz, the two Stoebers, and Candidus. And so she has furnished *German* scholars of the greatest renown. You are—just to give an instance—well acquainted with Ludwig Spach and Ludwig Haeusser, the latter of whom many Americans who have studied at Heidelberg will remember with great affection. As far as the language is concerned, by far the majority of the inhabitants still belong to the old *fatherland*, all the tourists notwithstanding, who have seen but Strasbourg, Mühlhausen, and some of the other large cities. Boeckh, the best authority, asserts that but one-eighth is perfectly conversant with French; and an Alsatian of note assures us that the system of suppressing the German language in the "Volksschulen" creates a "silent but deep loathing" among the population. In the "Volksbibliotheken," which were established but a few years ago, the German books are in far greater demand than the French. In 1865, an exact return was made from nine cities; they showed a demand for about 42,000 German books againt 32,000 French. I have selected only a very few examples, and even those almost at random; but I think you will, nevertheless, acknowledge that they go far to warrant the hope that the Alsatians will ere long be more than reconciled to their having been reunited with Germany, especially as Germany has now to stand back before no country of the world as a political power.

I have trespassed already too long upon your patience. I therefore can but just mention one point which I should have liked to dwell upon at some length. We *must* have Alsace and Lorraine, because we can no longer allow France to prepare vast armies behind the impenetrable screen of the Vosges with which she could in a moment, under any government less incapable than that of the Second Empire, overrun South Germany, as has been proved only too often. *The passes of the Vosges* must be in our hands; then, and only then, we are comparatively secure from new attacks. Even this time nothing but the utter incapacity of the leaders kept the French from throwing 40,000 men over the Rhine, who would have been able to penetrate as far into South Germany as Munich, or at least as Stuttgart, before the Prussians could have been ready. We can no longer depend for our peace upon such pieces of good fortune as our having a Moltke and a Bismarck, and the French having a Napoleon III. Therefore, I am perfectly convinced that Bismarck will consult the *strategists* and not the *philologists* in drawing the line of the new border, though some thousands or some ten thousand Frenchmen may in consequence become annexed to Germany. And he will be right, and the world ought to be grateful to him for doing it, for it will help much more to secure the peace of Europe than all the orations of Mrs. Howe and all the—I confess touching—letters of Mme. Gasparin.—Very respectfully yours,

DR. H. VON HOLST.

NEW YORK, November 3.

THE PRUSSIAN MILITARY SYSTEM.

TO THE EDITOR OF THE NATION:

SIR: By the law of Prussia, all able-bodied subjects—including, of course, "statesmen, financiers, men of science, and scholars"—between certain ages are, *in esse* or *in posse*, soldiers. In your last issue, your correspondent "A. T." considers that the Prussian military system is not what it purports to be, and that it is not strictly and honestly carried out. For the support of this assumption no evidence has been brought forward, either by the writer of the *Pall Mall Gazette* article referred to, or by "A. T.," and it is no more incumbent on us to support our assertion that nearly all the leading Prussians are soldiers by citing names than it is for "A. T." to name the Chinamen who massacred the French near Peking, or to describe the personal appearance of the sick Turcos who dastardly assaulted the Sisters of Mercy who visited them in a Berlin hospital.

Glancing at a number of the *Pall Mall Gazette* of later date than the issue which contains the article entitled "How to Fight the Prussians," we find that "*all the better class of Prussians . . . . have been called into the field or sent to the dépôt as men of the reserve.*" As "A. T." considers this paper a "highly respectable source," we will make one more quotation. In the issue of September 16, we are told that "there is of course a danger lest success should lead to an exaggerated estimate of the qualities of those who have obtained it; but, on the other hand, the steps which secure victory should be carefully traced, and among one of the broadest and firmest is the constitution and general education of the German army. An army of thinking bayonets, officered by men of liberal as well as professional education, who belong to the higher ranks of their country's society, and have been brought up with habits of command, is as nearly irresistible as the elements of what is falsely called chance in war will permit any army to be."

From the Universities of Berlin, Göttingen, Halle, Kiel, and many others, some professors, and nearly all the students fit to bear arms, have become soldiers. Count Bismarck himself is in the army, and we have reason to believe that Dr. Sintenis, Dr. Elder, Herr v. Seebach, and members of the Cologne Chamber of Commerce, including the "wealthiest and most noted merchants of Rhineland," have also entered the army. Herr von Gersdorff, the former Prussian Consul-General in Egypt, is a landwehr captain in the same brigade in which at least one of the six Sanskrit scholars is serving. During the battles about Metz, the only son of Secretary Count Itzenputz was killed while serving as a private. Count Bismarck's two sons were present at the same engagements; the one who served in the ranks was severely wounded. The son of the Minister of War, Von Roon, has also been either killed or badly wounded. The proof that all distinguished Prussians are in the army is, on the spur of the moment, not so easily obtained as the knowledge that their sons are serving; for we only hear of that portion of the army actually in contact with the enemy; and Prussia has as yet not seen fit to place in French territory any but her youngest sons. But "A. T." may rest assured that, when required, the fathers of the men who have fought their way to Paris will be forthcoming at the first click of the telegraph. In a letter from the Duke of Mecklenburg's headquarters, in the London *Times* of October 6 (thought by a correspondent of the *Athenæum* to have been written by Mr. Motley, and attributed by others to General Burnside), it is stated that the Prussian troops which the writer saw were "all young men from twenty to twenty-six, except a few more elderly officers." This shows that, besides the able-bodied surplus, men of delicate constitution, old men, women, and children, there is still a large portion of the flower of the nation engaged in providing "bread to eat, clothes to wear, coal to burn, and other necessaries of life, to say nothing of the luxuries." We can see no reason why an "appreciable number of editors, printers, compositors, type-founders, lawyers, judges, professors, tutors, students, bankers, merchants, clerks, or skilled artisans" cannot as well ply their various vocations because they have merely exchanged their citizen's dress for the military tunic.

The supposition that the Prussian army is "principally composed of loafers, roughs, restless, reckless, shiftless, dissatisfied, unsuccessful men, who hail with delight a conjuncture like the present," is so flagrant and palpable an error that I will not trespass upon your space by refuting it; nor will I make quotations from the various numbers of the *Pall Mall Gazette* before me, which show that the military law is so rigidly enforced that *not even volunteers are received*, but each citizen is compelled to take his turn as a soldier.

At the time of the Austrian war, we were able to name many Prussian "statesmen, financiers, men of science, and scholars" who were in the service. As the present war has made larger demands upon the resources of the nation, we have a right to assume that their number has likewise increased. Although the natural way would be to enumerate the prominent Prussians who are *not* in the army, yet, a reasonable time being given, it would be a very easy task to obtain a list of names of the "leading men in every walk of life" who have either been killed outright, died from the effects of their wounds, or who are now serving in the North German army, such that, if printed, would cover nearly two pages of the *Nation*. The following list of men of science now serving in the Prussian army may be relied on as accurate: Dr. Beneke, of Königsberg, a distinguished microscopist; Dr. Gruenhagen, Professors Wagner, Burow, Mocker, Jacobson, of the same university; Busch, of Bonn; Willms, of Berlin; and Jacobson, of Tübingen.

I am, sir, your obedient servant,

THE WRITER OF THE ARTICLE UPON "THE MILITARY RESOURCES OF PRUSSIA AND FRANCE."

BOSTON, October 24, 1870.

[A correspondent has kindly informed us that the Dr. M. referred to in a previous communication as professor of political law in Halle, now serving in the Prussian army, is Dr. E. Meier.—ED. NATION.]

YOUNG YALE AGAIN.

TO THE EDITOR OF THE NATION:

SIR: If you have space and patience for anything more about the Yale "difference," it may be worth while to let the attention of your readers be called to the very apt and suggestive illustration of what "Young Yale" complains of, which has just been afforded by the visit of "Tom Hughes."

Every American boy who expects to go to college *somewhere* within the next four years has read everything his family newspaper has had to say about the doings and sayings in this country of that (to the boy at least) representative university man.

Has the boy had an opportunity to read anything in the connection to remind him that such an institution as Yale College exists? Has he not rather had much negative evidence that, if he wants to go to a college where he will have a chance to participate in "what's going on in the [college] world," he must go to Harvard or Cornell?

It won't do to call these suggestive circumstances accidental. They are entirely in conformity with the whole course of things which let the last freshman class at Yale be much smaller than the corresponding class at Harvard. Until lately, Yale was, time out of mind, pretty uniformly ahead. I would not admit mere numbers to be a test of the relative standing of colleges; but between two colleges so nearly on a level in other respects as Yale and Harvard, a remarkable discrepancy in numbers seeking admission is significant, especially when the discrepancy reverses the long-established order of things.

Let me repeat that I mention the Tom Hughes matter merely as a straw to show which way the wind blows. It will not be worth the while of anybody on the other side to try to be funny by assuming that I think the straw and the wind are the same thing, as some one did in criticising Mr. Phelps's mention of the President's son. LL. B.

NEW YORK, Nov. 10, 1870.

MORE OF HIS IMPUDENCE.

TO THE EDITOR OF THE NATION:

SIR: In view of the results of the recent election in Massachusetts, I do not think it worth while to further trouble you at this time. It is painfully apparent that the people even of this, the section of the common country most advanced in political thought, are not ripe for the supreme efforts at reform. Without this *point d'appui* it is premature to attempt a further prosecution of the war beyond our limits and among a less enlightened people.

From time to time, as utterances of peculiar weight or brilliancy—their more precious pearls of thought—are elicited from my associates, I may perhaps seek quietly to place them before the unsympathetic eyes which alone peruse your columns. Meanwhile, for the present, I have done. I will not even respond, as I might, to the ungenerous fling at myself and the class to which I belong with which you tried to dismiss my last letter. If there is one thing which a severe study of the "Phillips philosophy" has taught me, it is *not to bandy words*. Indeed, with the great example of Mr. Phillips, in this respect, before my eyes, I should be ashamed to do so, even did I feel disposed. At the same time, I cannot read your reference to that noble poetess who now is grappling single-handed with Otto von Bismarck in the cause of peace, or to that simple Christian gentleman now vindicating with clean hands, pure tongue, and guileless heart those friends of his who last winter rushed in aid to that just, but little understood, legislative measure, the Hartford and Erie bill—I cannot, I say, read your references to these two bright lights of advancing thought, without applying to you, in pity rather than in anger, these lines of Browning:

> "'Tis only when they spring to heaven that angels
> Reveal themselves to you; they sit all day
> Beside you, and lie down at night by you,
> Who care not for their presence—flout or sneer—
> And all at once they leave you, and you know them!
> We are so fooled, so cheated!"

A SENTIMENTALIST.

BOSTON, December 14, 1870.

[We said nothing against Mrs. Howe. We simply drew the attention of a foolish Sentimentalist to the existence of certain rules of international law which, whether Sentimentalists like them or not, will have to be modified before any cruiser can take the sea against Bismarck, under that lady's flag, with the recognition of our Government.—ED. NATION.]

A CORRECTION.

TO THE EDITOR OF THE NATION:

SIR: A writer in your last week's issue, in an article headed "The 'Pooling' of Railroad Receipts," speaks by name of three leading railroad men, of whom Mr. John Edgar Thomson is one, and characterizes them as "avaricious, unscrupulous, often dishonest, and always unreliable." As one who has had some opportunities of knowledge on the subject, I beg to say, in behalf of Mr. Thomson, that there is nothing in the private character or public record of that gentleman to warrant a paper like the *Nation* in affixing to his name such damaging epithets. The appearance of this sentence in columns usually so carefully guarded against personalities must surely have been owing to some oversight or inadvertence.

PHILADELPHIA.

[The charges are certainly such as should not be made against anybody unless supported by specifications, and we regret their appearance, which was due to an oversight.—ED. NATION.]

Notes.

LITERARY.

ANY one in search of illustrated books for the holidays should consult the elegant "Illustrated Catalogue" of Messrs. Cassell, Petter & Galpin, whose agent in this city is Mr. Robert Turner. It is a collection of pictures which may even be bought for its own sake, as no doubt it will be. The Bible, Milton's, Bunyan's, and Shakespeare's works, La Fontaine, and Dante, this house have published, with large illustrations, chiefly by Doré, of which a sample is here given in each case; together with Æsop, Munchausen, Gulliver, Don Quixote, Robinson Crusoe, Fairy Tales, The Swiss Family Robinson, Foxe's Martyrs, works on natural history, the industrial arts, education, etc. The Catalogue contains sixty pages quarto, and is sold for one dollar.——Some of the papers read at the late meeting of the American Social Science Association in Philadelphia have already been published in pamphlet form. To one of these we have recently referred—Mr. Hamilton A. Hill's, on the "Relations of Business Men to National Legislation." This may probably be procured of the author in Boston. Mr. Eckley B. Coxe's admirable essay on "Mining Legislation," and that of Mr. J. G. Rosengarten on the "Civil Service," may both be had on application to the latter, who is Secretary of the Philadelphia Branch, at 532 Walnut Street.——Mr. Emanuel Deutsch's work on "The Talmud" is to be reprinted here by Messrs. Leypoldt & Holt, along with these: "The First Duty of Woman," by Mary Taylor, and Taine's "Art in the Netherlands." They also announce a new volume of poems by Mr. Robert Weeks, to be called "Episodes and Lyric Pieces."——An additional and important announcement by Messrs. Macmillan & Co. is "An Introduction to the Osteology of the Mammalia," by W. H. Flower, Hunterian Professor of Comparative Anatomy and Physiology in the Royal College of Surgeons in London. The work will be illustrated with elaborate woodcuts, executed under the author's personal superintendence.

—No department of literature, it appears, is so crowded that there is not room for inventions and novelties. Following the appearance of *Nature*, the *Academy*, and the *Graphic*, we have Messrs. Sampson Low & Co.'s monthly, *Art*—of which the full title is "Art, Pictorial and Industrial: an Illustrated Magazine, with which is incorporated the *Photographic Art Journal*." Photography, though not art in itself, had, however, reached the stage in which, as ancillary to art, it could no longer be excluded from the same category; and the union became a perfectly proper one. The carbon process may be considered the discovery which opened the way to this alliance; but, invaluable as it is for reproducing in fac-simile the drawings of the Old Masters, and putting them within reach of everybody capable of appreciating them, its usefulness is much less varied than that of the Woodbury, Albert, and similar processes. Different from the two named, as from the carbon process, is that used for the autotypes we spoke of last week, and again in *Art*. The second number (for August) lies before us, and has six illustrations—one from a water-color drawing; another from an oil-painting; a third from a drawing (by Rembrandt); a fourth from a steel engraving; a fifth from an architectural study; and the last a charming selection from nature. This series shows very well the wonderful capacity of the process for catching tints as well as lines. The text is interesting reading, and especially to be remarked is the first of a series of articles on "Female Artists and Art-Schools of England," by Mr. J. Cordy Jeaffreson, who writes with a charming lightness of style and a degree of solid information which promises equally entertainment and instruction to his readers. Messrs. G. P. Putnam & Sons are the agents for *Art* in this country, where the subscription price is $13 50, and per copy $1 25.

—The autotype process employed for *Art* has been adopted for a work which we commend to those whose tastes are for what is either picturesque or architectural in classic remains. We refer to a forthcoming album of twenty-five plates, eight inches by ten, under the auspices of Mr. W. J. Stillman, late United States Consul in Crete, and not unknown to the readers of the *Nation* as one of its correspondents. To some of these, Mr. Stillman is further known as an artist in colors, to others as one of the best of our art-critics, and to others still—a few—as a practical photographer. He has undertaken, from a double devotion to art and to Greece, to present complete views of the Acropolis and the buildings upon it, showing their construction without and within, and their relations to each other, together with such chance bits of Athens, the surrounding heights, the Peiræus, and even of the Bay of Salamis, as came within the field of his camera. Many of these views have never been taken before, and all are the result of the most careful selection from among a great number of experiments. Architects will be interested to learn that, by means of a peculiar lens, the photographs intended for them have all the merits of drawings at scale, and may be measured accordingly; and that they clearly show those remarkable curves in the horizontal lines, and variations in the intercolumnar spaces, which prove how thoroughly the Greeks understood the laws of perspective, and used them to aggrandize the effect of their buildings. This album is to be published in England, at about £4 per copy, and only a hundred copies will be printed, for subscribers. It will be delivered here without publishers' commissions. Intending subscribers may address Mr. Stillman for the present at Plainfield, New Jersey. Should his experiment prove successful, it is quite probable that he will repeat it for the other temples of Athens and of Greece, including some which are scarcely known even to archæologists.

— The letter of an American surgeon, which we print elsewhere, is in the line of other testimony from abroad as to the superiority of American surgery. An eminent professor in Dublin, some time ago, referred to the reports of several successful cases of amputation of the hip-joint, published by our War Department, in a specimen number of a projected "Medical and Surgical History of the War," and then quoting from McLeod's "Surgical History of the Crimean War," in which there was not a single successful case of this character, paid a glowing compliment to the boldness and skill of American operators. Professor Billroth, the first surgeon and pathologist of Vienna, in a late lecture to his class, when speaking of œsophagotomy (cutting open the œsophagus for the removal of a foreign body), said it was an operation which had never yet been successfully performed. But the next day, having been shown authentic reports of several cases in which the operation had been performed by Dr. Cheever, of Boston, with complete success, he publicly took back what he had said, and stated what had been done by the Boston surgeon, adding, "here again, gentlemen, we are indebted to our American brethren for important advances in our profession." When Professors Gross and Pancoast visited Berlin, a short time since, they were received with the most distinguished respect and hospitality. The former was introduced by Professor Virchow to the class, and consulted with in regard to an operation by Professor Langenbeck; the latter was urged by Professor Graeffe to operate on some eye-cases, in order to give the students an opportunity of witnessing the different methods. His operation for the resection of the trifacial nerve excited much admiration.

—The October number of the *American Law Review* commences the fifth volume of what has proved to the legal profession of the United States, for the first time in their history, a worthy medium for the discussion of the science of jurisprudence, the current history of the bench and the law, and independent censorship and criticism of legal matters. It contains three articles on topics of purely professional interest: a discussion of Codes, another contribution to the much-vexed topic of the Degrees of Negligence, and an acute handling of the doctrine governing suits between firms with a common member. There is also a good account of the trials of Tropmann and of Prince Bonaparte, which is as interesting to the general as it is to the professional reader. Then follows a digest of the cases contained in the new English Law Reports, which brings the law of these costly, important, and, to most lawyers, inaccessible volumes within the reach of all. Another feature, equally valuable and convenient, is a selection from the digests of the decisions of the State courts. In every State there is at least one new volume of reports each year; in many, two; in our own afflicted New York, sometimes as many as ten. The *Law Review* selects from this mass of cases those which contain new points or superior discussions of old ones, thus effecting a great saving of time and money to the overburdened practitioner. Seventy-eight pages are given, in conclusion, to a summary of events in all the States of the Union and of Great Britain, which contains a great body of entertaining and useful news, relating to legal topics, most carefully collected and cleverly put together. The bar has in these pages at last found a voice with which it can speak. It was quite time. The public will expect from it a fearless, steady assault upon the frightful evils which the decay of judicial learning and character is working. The *Review* passes with this number into the hands of new editors, who, though young, are men of thorough training and assured ability. We invite them to take hold of the important work before them with vigor and resolution, assuring them that, if they achieve the success of their predecessors, they will win laurels worth wearing.

—By no correspondence from Paris since the siege ("par ballon monté") have we been more entertained or better informed than by that of the Milan *Perseveranza.* The intelligent and clear-headed writer, whoever he may be, at the first closing of the mails, began keeping a diary, in which everything notable of what he saw or heard or reflected was jotted down in the order in which it occurred. The result is one of the most valuable and impartial records of the siege that has yet got to the outer world. In his journal for October 6 (*Perseveranza,* October 20), he devotes considerable space to the press of Paris since September 4, or after the Republic had been proclaimed. This event naturally created a great number of petty newspapers, while the siege, causing a scarcity of paper, compelled many to suspend. Thus died, for instance, either for want of popularity or support, the *Volontaire* of Clément Duvernois, and the *Histoire.* On the very evening of the 4th appeared Delescluze's *Réveil* and Hugo's *Rappel.* The former preaches the most advanced doctrine, and abounds in false intelligence, often of the most absurd character, concerning French victories and Prussian defeats—"des triomphes de gazettes, et des succès à coups de presse." Two journals especially inherit the mantle of 1848, and are edited by former revolutionists—the *Combat* of Félix Pyat, and the *Patrie en Danger* of Blanqui. The former opened, on the 4th of October, a five-centime subscription for a gun to be presented to the Frenchman who should assassinate King William; and it is noticeable that among the signers was Rogeard, the famous author of "Les Propos de Labiénus," who might have been engaged in better business. Blanqui's paper is more outspoken and direct in aim, and is the morning echo of the nightly club which bears the editor's name. Among the new penny papers are the *Petit National,* the *Moniteur de la République,* the *Avant-Garde,* etc. One more enterprising, but probably too venturesome, the *Nouvelles,* appears four times a day. The papers already established naturally underwent changes more or less remarkable. The *National,* Liberal, became Republican; the *Soir,* Imperialist, turned Red. The *Constitutionnel,* the *Patrie,* the *Pays,* had the decency to become neutral, and are all reduced to a half-sheet, as is likewise the *Presse,* which remains unchanged in character, the *Gazette de France,* Legitimist at heart, and many others. The *Journal des Débats* maintains its former dignity and independence, and silently awaits the opportunity of the Orleanists. The *Siècle* continues to be an honest Republican paper, and gives a great deal of interesting news and correspondence. The *Opinion Nationale,* neither flesh nor fish, has yet good military reports. Best of all is the *Temps,* with its strategic articles and diary of the siege, and is the most read. The four papers last mentioned had not (Oct. 6) undergone any change of form or management. The *Figaro* has lost its support and influence, to the advantage of the *Gaulois,* which, while neutral in politics, pretends to be both honest and patriotic. The *Électeur Libre* was the most read of evening papers after Ernest Picard became minister, leaving his brother Arthur in charge; but the latter proved indiscreet in his revelation of the doings at the Hôtel de Ville, and the paper was converted, Oct. 3, into the *Vérité,* having no connection with the Picards. The *Paris Journal* had lived, says the correspondent from whom we are copying, a mendacious life of two months, was reduced to a half-sheet, and seemed doomed to disappear. This fate had happily overtaken the *Journal Amusant,* the *Vie Parisienne,* and others of the same dirty species.

—Some idea of the enormous scale upon which the triennial competitive examinations are carried out in China may be formed from the statistics contained in the last issues to hand of the Shanghai papers. The *News-letter* of Sept. 13 states that arrangements had been made at Nanking for twenty-two thousand candidates, although but eighteen thousand appeared. These, too, were from three provinces only, Kiang-su, Kiang-si (generally known as the "Two Kiang"), and Anhwei. A novel feature of this year's proceedings is that Ting, the Governor of Kiang-si, has placed two steamers at the disposal of the candidates to convey them to and from Nanking free of expense—a clever bid for popularity with the most influential class within his jurisdiction. As these examinations are usually attended by an exhibition of strong dislike to foreigners, it is to be hoped that Ting will exercise his influence on the side of peace. Meantime, the gathering of this vast crowd at the second city of the Empire adds another dangerous feature to the existing troubles, and may, not impossibly, precipitate the collision between China and powers other than France which the literati are so anxious to bring about. It is somewhat disappointing, by the way, to find that the only periodical in China which aims at taking rank above the ephemeral productions of the daily and weekly press contains in its latest numbers no reference to the event which has, even during the progress of a European war, attracted considerable attention in this country. The August and September issues of the *Chinese Recorder and Missionary Journal* ignore entirely the Tientsing massacre and its effect upon mission-work in China. We can scarcely suppose its conductors to be so illiberal as to deem the event not worth notice because the victims were Roman Catholics; nor would that plea hold good, as the Protestant missionaries at Tungchow have been compelled to leave their mission in consequence of the immunity thus far extended to the Tientsing murderers. The omission, however, can scarcely be the result of carelessness.

—We may call attention to two recent works, quite different in character, which add considerably to our knowledge of the inhabitants and rulers of China. One is the useful publication, ostensibly produced under the auspices of the native government, but compiled by its foreign customs employees, and edited by the Commissioner at Shanghai. Its title, "Reports on Trade at the Treaty Ports in China for 1869," would scarcely lead one to suspect what a vast amount of readable matter it contains. To the merchant, its tables will doubtless be as valuable as any other portion of its closely printed pages. To outsiders, however, its interest lies more particularly in the often able papers from the various commissioners, in which the influence of political and social events upon the trade of the year is discussed in an intelligent manner. The work is of special interest to all nations having dealings with China, and the cosmopolitan organization of the Chinese customs staff deprives the compilation of any national bias. The editor, Mr. Dick, appends an able paper, entitled "Suggestions for the Revision of the Chinese Customs Tariff and Trade Regulations," in which the results arrived at by a comparison of the various reports are clearly laid down and supplemented by valuable suggestions on the part of the writer. The other work to which we had reference was published in England (Smith, Elder & Co.), and is entitled "Journeys in North China, Manchuria, and Eastern Mongolia, with some Account of Corea," by the Rev. Alex. Williamson, B A., late missionary at Chefoo. Much of the information which it gives had been published in a crude form by the author in local papers, but all persons interested in Chinese matters will be glad to find it arranged and amplified in these two volumes. Of Manchuria, Mongolia, and Corea, so little has hitherto been known that the least addition to our limited stock of information would be welcome; and Mr. Williamson's book abounds in valuable remarks upon the countries in question—the customs of the people, the productions of the soil, and the mineral wealth underlying the vast and almost unexplored area of which it treats. It is well illustrated by engravings from photographs.

DOES PROTECTION PROTECT?[*]

THIS book is one to which the term work may be fitly applied in its truest and best sense, for it is full of work from beginning to end. Throughout a volume of 360 pages, not one unnecessary word is to be found. The argument is supported by the largest array of well-selected and well-presented statistics bearing upon the subject that is to be found in any volume in any language with which we are acquainted. The spirit throughout is one of earnest enquiry and fairness, coupled with a modest diffidence that in one respect can scarcely fail to injure the work; for the title "Does Protection Protect?" conveys only the faintest possible idea of the range of the investigation whose results are here presented, and is apt to suggest to many persons the preconceived opinion against protection which is the very reverse of that from which the author started.

It is true that the work owes its origin to the enquiry which has given it a title. In the introduction, the author says:

> "Born of Whig parents, trained under influences wholly favorable to the system of protection, and thrown, when I began life for myself, into editorial association with an able and experienced advocate of that policy, I rather borrowed than formed the belief that it was the wisest, and joined with sincerity, if not with clear understanding, in efforts to secure 'Protection for American Industry.' . . . In legislation since the war, prompted by frequent appeals by those interests which had been most favored, I saw reason to doubt whether the trial of the protective system had entirely justified the anticipations of its advocates. *It seemed to me strange that, if protection had the desired effect, favored interests should be constantly demanding more protection*, and I began to look into the question for myself. These pages are the result."

The sentence italicized by us gives not only the origin of the enquiry, but almost the answer as well. If further and more explicit answer were needed, every one of the chapters singly furnishes an answer, conclusive, irresistible. To answer that enquiry, this volume was not required, and it is for this reason that we think the author's choice of a title does injustice to himself and to his work. For his work is greatly more than this. In another part of the introduction he says:

> "A fixed theory possesses a more than magnetic power of drawing to itself congenial facts, and repelling all others. This world has all sorts of facts in it, and the man who searches with a fixed idea in his head will always find facts to fit that idea. In questions of political economy, this method may be called the seductive, whereas that science demands the inductive. He who would arrive at truth must invite all facts, and be content to take such theories as they may bring with them. I have honestly endeavored to follow this method."

In pursuance of this plan, Mr. Grosvenor has made a most elaborate survey of all the leading interests affected by tariffs, whether industrial, agricultural, commercial, or financial; he has investigated the condition of labor and prices, of population and wealth; he has canvassed and discussed all the principal theories relating to each, and has gathered up, digested, arranged, tabulated, and reduced to diagrams such a vast mass of statistical matter that his work must henceforth be considered as the starting-point, the basis, of all future statistical labors in the United States.

It furnishes the most complete evidence of the fact that protection does not only not prevent excessive imports, but that it retards exports, and thus enlarges the balance of trade against us. It shows that protection diminishes the production of wealth by agriculture which is not protected, while it fails to hasten the healthy growth of the manufacturing industries which have enjoyed the largest amount of what is called legislative favor. It proves that the wages of labor have been lower, measured by their purchasing power, in times of protection than in times of non-protection; and that under protection the less favorable condition of the working-classes has proved a diminished incentive to foreign immigration, and has forced the community to diminish their consumption of many of the comforts, if not of some of the essential necessaries, of life. The general result of Mr. Grosvenor's labors cannot be better given than in his own closing words, which, we are convinced, will be emphatically endorsed by every thoughtful reader who follows him, as most will do, unto the end:

> "When I began this enquiry, I still believed, as in earlier days I had been taught, that, while the tariff was confessedly defective, permanent protection in some form and degree must be beneficial. The enquiry has led me to the conviction that protection, as a permanent policy, if ever useful, no longer benefits American labor as a whole; that its supposed benefits are mainly unreal, and, when they are real, fall to the share of capital, and do not improve the condition or stimulate the energy and inventive genius of labor; and that this country, realizing its natural superiority of resources, and its vast advantages in political freedom and intelligence of labor, should henceforth seek prosperity through the only efficient and enduring protection which can be given to industry—the removal of all unnecessary burdens. That enquiry has convinced at least one person that we need nothing else so much as to stimulate the native vigor and inventive power of our industry by competition with the labor and skill of other countries. The best protection for industry is to let it alone. Human wisdom cannot better, by artificial laws, the conditions under which the Creator has placed human labor by the natural laws of exchange. The world which He has given us is, in those provisions, the work of a higher intelligence than legislators have at their command; they may mar but can never mend it by interfering with its fundamental laws."

To review the book thoroughly would require a discussion of all the essential problems of political economy—a task that we shall be scarcely expected to undertake. Beyond commending the work in the strongest possible terms to every student of the science, and to every one interested in the great problem of Revenue Reform, we must confine ourselves to pointing out one or two of the instances—and they are not few—where we materially differ from his conclusions.

Although the argument of the protectionists, that high duties diminish imports, receives at our author's hands the most emphatic denial, he nevertheless seems to agree with the protectionists that large imports are in themselves an evil, or, at least, that it is highly undesirable for a country to import more than it exports, in other words, to have what is called an unfavorable balance of trade. Now, without entering here into an elaborate investigation of that mysterious entity, the balance of trade, we would call Mr. Grosvenor's attention to the fact that almost all nations engaged in a profitable foreign trade are constantly running up so-called unfavorable balances. England, for example—and it is generally admitted that England's foreign trade is on the whole a profitable one—England imports every year far more than she exports, the excess running from 15 to 33 per cent. of the total exports, and the percentage of excess being in striking harmony with her general prosperity. The most prosperous years are those in which the unfavorable balance is largest, and the unfavorable balance is smallest in the years of depression or those immediately following. Between 1854 and 1857, the percentage of excess varied from 23 to 32 per cent. In 1858 and 1859, following our terrible crisis, it fell to 18 and 15 per cent., the smallest for a long series of years. In 1860 and 1861, the percentage again rose to 28 and 36 per cent., the evil effects of our war not being experienced until 1863, when it fell to 26, and has, throughout the period of financial gloom and depression prevailing since, *been steadily declining* up to 1867, when it had fallen to 21 per cent., since which date we have not the figures at hand. During the ten years from 1858 to 1867 inclusive, England ran up an unfavorable balance of trade of not less than 2,400 millions in gold for merchandise alone, yet it will scarcely be claimed that England is materially in debt to other countries. And lest any one deem that the balance may have been paid for in coin, or diminished by coin shipments, we would state that during that same period England actually imported 270 millions more of gold and silver than it exported, so that the bullion and specie movement really increased the accumulated balance to 2,670 millions. It is to be regretted that Mr. Grosvenor should not have sought the light which a few leading foreign statistics would have thrown across his path; but perhaps the material already on his hand was as much as could be readily managed, especially since he had to commence almost everything from the beginning. After him the work of others will be lighter.

We had proposed to ourselves to take issue also with Mr. Grosvenor on some important questions relating to the currency, as well as to point out to him a truth on the verge of which he seems repeatedly hovering without ever actually discovering it, namely, that the basis of all national prosperity is to be found in the *profits* earned by the producers of the necessaries of life; for they, being the largest consumers, essentially regulate the prosperity of every other class by their ability to consume its products. A careful consideration of this truth, habitually and persistently lost sight of by every economist with whom we are acquainted, would have cleared up many doubts and difficulties in our author's path. We have unfortunately not left ourselves space to pursue the subject now.

MARCH'S COMPARATIVE GRAMMAR OF THE ANGLO-SAXON LANGUAGE.[*]

THERE is a growing conviction in the public mind that every system of liberal education should include a philological study of the English language. This study, if it is to be really thorough, cannot be confined to the forms of speech current at the present day. To comprehend what the language now is, we must understand how it came to be so. For the English this is especially necessary, as its modes of expression are often dependent on a system of inflection which long ago ceased to exist. Hence it is becoming more and more apparent that the only sufficient basis for a scientific knowledge of English is to be found in a thorough study of Anglo-Saxon. It is strange that the recognition of this fact has not sooner led to the composition of a good manual for Anglo-Saxon study. No one who has attended to the subject needs to be informed that the Anglo Saxon grammars and reading-books hitherto published have been very far from satisfactory. The learned Dane, Erasmus Rask, early in this century, made a beginning which for its time was excellent and praiseworthy. But English scholars, instead of advancing upon Rask, have been content with repeating and abridging him. Among the Germans Grimm and his followers have studied this, as all the other old Germanic languages, with great ardor and success; but they have not produced an Anglo-Saxon grammar fitted for the student's use.

---

[*] "Does Protection Protect? An Examination of the Effect of Different Forms of Tariff upon American Industry. By W. M. Grosvenor, editor of the St. Louis *Democrat*." 1 vol. 8vo. New York: D. Appleton & Co. 1871.

[*] "A Comparative Grammar of the Anglo-Saxon Language; in which its forms are illustrated by those of the Sanskrit, Greek, Latin, Gothic, Old Saxon, Old Friesic, Old Norse, and Old High-German. By Francis A. March, Professor of the English Language and Comparative Philology in Lafayette College, author of 'Method of Philological Study of the English Language,' 'A Parser and Analyzer for Beginners,' etc." New York: Harper & Brothers. 1870. 8vo, pp. 253.

It is matter for congratulation that this deficiency in the means of study no longer exists, that Professor March has supplied it in a manner so thorough and scholarly. Seldom does a school-book bear the marks of such careful and faithful elaboration. It is plain that the author has not gone through his work as a piece of literary drudgery. It has been to him a labor of love; he has thrown himself into it with his whole mind and character. His personality glows through the crust of grammatical rules and forms, and gives a living interest to his pages.

While the work, as a whole, is remarkable among grammars for its originality, the most original part of it is the syntax. In this field the author has had to labor as a pioneer. No one before him has written what could with any propriety be called a syntax of the Anglo-Saxon. He has had to collect the material, as well as to digest and arrange it, for himself. The body of constructions and idioms which he has brought together, and the copious citations by which they are illustrated, show a wide extent of reading and much acuteness of observation. The statement of principles is sharp, pithy, and forcible. The arrangement, while pervaded by a rigorous logic, is not difficult to understand, and is convenient for use. Care is taken to distinguish the ordinary modes of expression from those of an unusual and exceptional nature. Very interesting are the comparisons made with similar constructions in Sanskrit, Greek, Latin, and other kindred languages. They are contributions to a department of philology as yet very little cultivated—the comparative syntax of the Indo-European family.

In the etymological part of the book these comparisons take a wider range, and form one of its most peculiar and important features. The student is made to see the relations of Anglo-Saxon inflection not only to the inflection of the Gothic and other old Germanic idioms, but also to that of Latin, Greek, Sanskrit, and even to the primitive Indo-European speech of which they are all descendants. In some cases, it may be, the forms which he gives as primitive are too weakly supported by proof to be worthy of reliance; for example, some of the plural and dual case-endings given (from Schleicher) on page 35. But in matters of this kind, where there are all degrees of probability, it is impossible to draw a clear line of distinction between things that may be accepted and things that must be rejected. The general method of the work is sound and scientific; and the student who masters it will become familiar with the principles of comparative philology, as applied to and illustrated from one of the older Indo-European tongues. This extension of its plan beyond the limits of the Anglo-Saxon has made the book a good deal larger and more complex than would otherwise have been necessary. But to this disadvantage, if such it is, we may willingly submit for the sake of the impulse and the assistance given here to the pursuit of general linguistic studies.

The work is one which both requires and rewards study. It is Professor March's habit to give his statements the forms in which they seem most interesting and impressive to his own mind. Other forms might, in particular instances, be more easily and quickly understood by the beginner. But the effort to follow a mind of such ingenuity and force cannot fail to be quickening to the student. The style is in a high degree condensed, nervous, and crowded with meaning. The grammatical elements are reduced to their lowest terms. Methods and processes are indicated by the briefest phrases, or presented to the eye by a kind of algebraic notation. This mode of treatment, if it makes large demands on the attention of the student, is well calculated to impress upon him the definiteness and positiveness of linguistic laws. It cultivates the habit of exact scientific thought, the want of which has brought so much harm and shame upon philology. The book, though not beyond the grasp of an energetic and clear-headed student working by himself, is rather fitted to serve as a basis for class instruction, where the teacher can make the selections required for the beginner, and supply all necessary explanations. This, it may be presumed, is the use made of it by the author himself, and which he expected it to serve in the hands of others. We trust that many teachers may be found to use it in the spirit of the author, and with the results which he has aimed to accomplish.

As a companion-book to the Grammar, Professor March has published an "Anglo-Saxon Reader," which contains in seventy pages an interesting series of extracts from Anglo-Saxon prose and poetry. The notes which follow them are excellent in quality, though perhaps less copious than could have been desired. The book has also a vocabulary and a brief grammar, which will be of use even to those who have the larger grammar, since it presents in a few pages the portions of that work which the author regards as of immediate and prime importance.

Ten Times One is Ten. The Possible Reformation. By Colonel Frederic Ingham [Rev. E. E. Hale]. (Boston: Roberts Brothers.)—"Ten Times One is Ten" is a Utopian sketch of the effect which might be produced on mankind by the widening influence of a single life. Harry Wadsworth, the hero of the book, is a young railroad freight agent, of manly and helpful character. He dies, and ten of the people whom he has been able to teach and cheer meet on the way to his funeral, and are compelled to wait four or five hours at the railway-station. Being Americans, they naturally fall to making speeches and passing resolutions, winding up, eventually, by forming themselves into a "society" to perpetuate Harry Wadsworth's memory and do his work. They agree to preserve his motto—

"To look up, and not down;
To look forward, and not back;
To look out, and not in;
And
To lend a hand."

They are also to exchange letters and reports of progress. In three years, the first letters come in. The Club is widely scattered—to Kansas, California, Calabria, New Zealand—and "No. 9 in the 3d Range, Maine," where our old friend, Mr. Frederic Ingham, the historian of the movement, has taken up his abode. Each member has gone to work in the spirit of the resolutions, and has infected ten or more besides himself with like spirit, so that the present number of the Club amounts to 100 or upwards. In six years it is 1,000; in nine, 10,000; in twelve, 100,000, and so on, until, at the close of the ninth triad, which brings us to the year 1882, we find 10,000,000,000—in other words, the entire population of the globe—believing in Harry Wadsworth and working according to his method. The millennium has come "of itself," as children say. There is a total abatement of murders, sensation trials, and railway accidents; the "great dailies" are forced to take to "feuilletons with continued stories in them" to keep themselves going; Congress adjourns, at the end of a three weeks' session, for lack of legislative pabulum; the public schools give daily half-holidays; and all the pretty county jails are thrown open for summer boarders. The pages of the New York *Herald* and the *Observer* abound with such advertisements as these:

SEVEN LANGUAGES! Four gentlemen with their wives, in whose number are good interpreters in seven languages, are ready to sail at a moment's warning. No charge or salary. Have met personally five of the Original Ten. Address F. O. U. R.

A WIDOW with four children will take into her family a paralyzed woman, or any blind person. Two sons, good at lifting invalids. No charge for board, lodging, or washing. Address LAUNDRESS.

The methods by which these reforms are brought about are most comically possible and most pathetically improbable, and the reader is left sighing in vain over the rose-colored vision.

There is a graphic adventure on the Ohio, which, if true, would suggest the desirability of having photographs of Harry Wadsworth struck off, and sold, in connection with accident insurance policies, to all persons going westward; the Ohio, like most American rivers of navigable draught, being an exceedingly "chancy" place for travellers. The young English lady who experiences the adventure, and finds the photograph so opportune, afterwards joins the Wadsworth Combination, and, with her husband, does good service there. But for their story, as well as other good things, we must refer our readers to the book. Mr. Hale's process of narrative belongs to what in botany is called the "endogenous" species, and is quite too admirable to be spoiled by further clipping or paring from us.

London Lyrics. By Frederick Locker. (Boston: Fields, Osgood & Co. 1870.)—It would seem to be a fact of literary history that really good *vers de société* have almost never been produced by men of English blood—the reason, perhaps, being that in the case of very few English writers in verse has an aptitude for refined wit, and light gayety, and skilful elegance of expression ever been disjoined from the serious depth of feeling and the serious earnestness of thought which are distinguishing qualities of poets who are of our race. For our nearest approaches to excellence in this kind of writing, we shall have to go back to Suckling and Prior—to the light-hearted courtier, carelessly playing with love in graceful rhyme, and to the somewhat shallow-natured man of letters and diplomatist veneered with the French culture of the days of the Anne-Augustan age. If we take our latest noticeable attempts at making *vers de société*—the name, as the thing, we borrow—we shall find in the poems of Praed and Thackeray the Anglo Saxon seriousness regularly interfering with our success. And this in two or three ways:—we sink into the sterile jocoseness of puns and the like; or our sentiment becomes pensive if not, indeed, sad; or we infuse a most unparlorlike depth of feeling into the restrained susceptibility and bright elegance of the feeling and thought proper to the true *vers de société;* or we fall into humorous or farcical delineation of character. It is not necessary, we imagine, as far as concerns making our position seem well taken, to do more than recall to the reader's memory the subdued melancholy of Praed when he seems to be writing most sincerely; or the half-mournful, half-playful retrospectiveness of Thackeray; or Praed's punning jests and squibs when he seems to be writing most gaily and most like a man of society; or Thackeray's satirical and humorous, or even farcical, Irish letter-writers and French veterans; or the same poet's truthfulness of regretful sentiment when the youth in the wine-shop sees his lady going past to church, and says to himself and her:

"Kneel undisturbed, fair saint,
Pour forth your praise or plaint
Meekly and duly;
I will not enter there
To sully your pure prayer
With thoughts unruly;"—

or such unaffected utterances of the tenderness of homelike affection as in the lines where he speaks thus:

"And when, its force expended,
The harmless storm was ended,
And as the sunrise splendid
Came blushing o'er the sea,
I thought, as day was breaking,
My little girls were waking,
And smiling and making
A prayer at home for me."

But these, it may be objected, hardly offer themselves as *vers de société;* they, and the Irish reporter's letters, and the recollections of old times in Paris, put in claims for a higher rank. Yet unless we take these poems, and such as these, into the account, we shall find that our two modern writers who are popularly set highest, and almost alone, among writers of society poems, have just about the same right to consideration among poets as have the ordinary writers in albums or the makers of charades—we shall find that there is left very little of the men themselves and just about as little in the way of *vers de société*.

Mr. Locker seems to us to have a good deal of the same sort of unfitness for working in his chosen field as disqualified his two immediate predecessors. He is retrospectively sentimental; he is given to rather feeble verbal wit, and frequently and with some considerable natural feeling he expresses warm parental affection. Apart from a sufficient cleverness of versification and neatness of phraseology—though he is not remarkable for correct and idiomatic English—his strength would seem to lie in what an exacting reader of poetry might probably call his weakness. Though not without thoughtfulness and feeling and humor, the easy pace of his verse is seldom made less light by any important burdens of heart or intellect, and he seems to have no natural qualifications or disqualifications which should make it impossible for him to be the Prior of *London Society* and the other less weighty magazines. His best effort, we think—gay, witty, elegant, and altogether agreeable—is this pair of stanzas, which he entitles "St. George's, Hanover Square":

"She passed up the aisle on the arm of her sire,
A delicate lady in bridal attire,
Fair emblem of virgin simplicity;
Half London was there, and, my word, there were few
That stood by the altar, or hid in a pew,
But envied Lord Nigel's felicity.

"O beautiful Bride! So meek in thy splendor,
So frank in thy love, and its trusting surrender,
Departing you leave us the town dim!
May happiness wing to thy bower unsought,
And may Nigel, esteeming his bliss as he ought,
Prove worthy thy worship—confound him."

Besides this little piece—the tone of which seems to us to be perfectly right—we have in a similarly true vein one or two glimpses of the good girl of the period, with her pretty innocence and her engagements and billets-doux; but oftener we find our poet on an inferior level. Perhaps he is doing the sort of thing that Mr. W. S. Gilbert has been doing in the wooden contortions of the "Bab Ballads"; or perhaps he is imitating Prior too closely; or, more likely, he is professing—with noticeable good humor and good faith, we are bound to say—the sort of patronizing indifferentism with which a certain school of recent English writers have made us too familiar; he lets us know that he has seen the theatre by daylight, and that he knows what is under Mr. Merryman's paint and spangles; or he pats Daffydowndilly on the head, but tells us that he himself has found out that, on the whole, claret wears better than May-dew; or he gives us three stanzas, in which he is a little tender over some old love-letters, and then he gives us three more, in which he is mildly cynical over the recollected fact that the Phillis of his dreams when he was twenty is married now, and thirty-five, and the mother of another man's twins. This kindly sentimentalism is, we suppose, as radically opposed to the genius of genuine society verses, or nearly as radically opposed to it, as the passion of Juliet or the woes of Cordelia; nevertheless, it is not in itself so unpleasant as it might be, though one likes it better in magazines, and a little at a time, than by the bookful. But, doubtless, having Mr. Locker at his worst is a prerequisite to having Mr. Locker at his best, and Mr. Locker at his best is worth having; and his bad is not so bad as to be unenjoyable.

The Rob Roy on the Jordan, Nile, Red Sea, Gennesareth, etc. A Canoe Cruise in Palestine and Egypt, and the Waters of Damascus. By J. Macgregor, M.A. With Maps and Illustrations. (New York: Harper & Bros. 1870.)—The awkward arrangement of his title indicates the stress which the author wishes to lay upon so much of his voyaging, from October, 1868, to April, 1869, as took place upon the Jordan; and on that river and on Gennesareth, it is true, he really made explorations and discoveries which add to the world's knowledge of the geography and history of Palestine. He floated where it is probable no boatman ever had preceded him, and noted with painstaking and all needful accuracy the springs, tributaries, and course of the river as far as the second lakes, which last he circumnavigated thoroughly, seeking to identify the Scriptural topography, and, we suppose, solving some of the problems which the New Testament narrative has given rise to among scholars. A whole chapter, for instance, is devoted to the Apostles' voyage from Bethsaida to Capernaum, "from a sailor's point of view," which consists in first scrutinizing the possible ports of embarkation from the north-eastern shore of Tiberias, and then testing the account of the voyage by several hypotheses as to the prevailing wind at the time, and the known width of the lake, and places of debarkation on the west coast. Of all his observations in Palestine, we may say in general that they seem worthy to be read with any commentary of the Scriptures, and to find a place in theological or in Sunday-school libraries. The *Rob Roy's* adventures here, however, succeeded, in point of time, short excursions through the Suez Canal into the Red Sea, and down the Nile to the Mediterranean; and although we cannot accuse any part of the book of lacking in interest, we have enjoyed most, for pure description and for its novelty, the log of the cruise in the Delta:

> "Many of the reaches of the Nile," says Mr. Macgregor, "were like what is seen from the window where these lines are written, as the heavy tide of the Severn runs sleepily past the red cliffs near Newnham. But substitutions must be made in the mind, if Gloucestershire is to look like the Delta. Those corn-fields are instead of maize; those bushy elms are put for palm-trees. The spires that point our English landscape must be thought of as minarets, gaudy and white, and this pleasant 'Severn Bank Hotel' is a change from the doorless, wall-less, windowless 'khan' of the East, with only a roof and pillars, and a general odor of donkeydom.
>
> "August here on the Severn will do very well for December on the Nile, and, as the moon lights up at eve, the difference between the two pictures is only that between shadows. That lazy boat at anchor, fishing in mid-channel, would do for either continent, only in Egypt there would be gay turbans on board, and the soft, melodious drum and gentle, careless song. . . .
>
> "Even a better likeness of the Nile is seen upon the Thames, from the garden of the hotel at Purfleet, where the old *Rob Roy*, on her first voyage, passed her first night in comfort.
>
> "The dikes along the Thames are smaller than in Egypt, but equally strong. The Essex marshes stretch their flat landscape on either side, just like the Delta. When the setting sun casts a hazier light behind the shores, and fancy is more free and colors are less true, then the tall tower of the new asylum on the opposite hill might well be taken for a Moslem minaret, and the whitebait-fisher's boats for boats of Egypt. Greenhithe, to our left from hence, is shaded deep, but we can still discern the sharp

masts of the *Chichester* training-ship, the floating home for the homeless boy, and, nearer, we hear a soft, sweet chant of the 'Evening Hymn' from the open ports of the *Cornwall*, where the poor lads who have slipped in first steps of life are put in the way upright, that they may cheer up and try again."

This last touch of the colportor is not out of place as a suggestion of contrast between the civilizations of the Thames and the Nile, whose scenery agrees so well. The captain of the *Rob Roy* seldom displays so naturally and unobtrusively his missionary self-mindfulness. He is more in character as a tolerably bigoted and complacent Christian, when reporting his Christmas sermon to the Arabs on the Abana:

> "The moon shone clear, and our fire had become embers when the Howaja joined the party round it and asked silence for his address. He told them that we had now reached the furthest point of our journey. After this, we were going south and west, and homeward. Then he turned to the journey of life, and the home for us pilgrims; then to the Christmas Day just finished, as a great mark in time's road to eternity; and then he gave them a condensed history of the world from the creation—the law, the prophets, and the Saviour, the apostles, the martyrs, and ourselves. Hany interpreted each sentence, and every sentence was heard with intense interest. It was, indeed, an open-air sermon, and what with the time, the place, the audience, and the occasion, we might feel solemnly the heavy responsibility we incur in speaking to others who will listen on subjects like these. Long after the hour for sleep these men were talking of it all. Perhaps no one of them had ever heard so much truth before, or will ever hear it again."

Something of this responsibility might properly be felt in writing as well as in open-air sermonizing; and we should like to ask Mr. Macgregor if he is quite ingenuous in quoting (p. 375) from Josephus, as if it had never been questioned, the famous passage from the "Antiquities" (book xviii., chap. iii., sec. iii.) describing the character and works of Jesus.

Three Years in the Sixth Corps. By George T. Stevens, Surgeon of the 77th Regiment New York Volunteers. Second edition, revised and corrected. (New York: D. Van Nostrand, Publisher. 1870.)—We have a very high opinion of the corps to which Surgeon Stevens belonged, and of their gallant services which he records; but as the book before us is hardly the one which will best perpetuate their fame, we will await a more favorable opportunity for reviewing their career, and venture now on a few general remarks. We suppose that every country town between the Atlantic and the Mississippi, north of Mason and Dixon's line, has its regimental surgeon, chaplain, commissary, or other non-combatant, who can tell an immense deal more of crushing the recent rebellion than could be gleaned elsewhere in all his neighborhood, though it may swarm with veterans who stood in the front in many fights. Somehow the non-combatant class were very observing. Going to the seat of war, they were the men who saw quite all the people who lined the railroads, dismissing all other affairs of life to wave clouds of handkerchiefs to the passing heroes; they can remember how many knives and forks were set at the Cooper Refreshment Saloon in Philadelphia; and they can repeat the little speech that the colonel made to the ladies there. They can tell you all the novel experiences and feelings of the first camp; all the drillings and burnishings and fevers which beset the regiment; how muddy it was when the fall rains set in. And they can go through the whole war with the same detail. They remember all the wet nights and icy mornings; all the short-ration days, when the troops cried "Hard Tack!"—all the dusty marches when there were no wells nor springs on the roads. In battle, they heard the screams of all the wounded horses; saw all the large trees that bullets cut in two; had a near view of the awful carnage produced by bayonet charges; saw all the individual acts of bravery; saw all the other corps falling back on both flanks, leaving their corps to bear the brunt alone against the whole of Lee's army. In fact, they saw everything, and made a note of it; and when they write war-books, as they sometimes do, they put it all down in black and white, giving honor to whom honor belongs. The result of their labors is very interesting to many families whose sons figure on the glowing page, and would be very useful to a person who had been shut up in Asia Minor during the rebellion, and had not read the newspapers of that time, and had no idea how anything was done in our war. But for the rest of mankind such works have less value, their accuracy not being equal to their minuteness; and as for their literary charm, we must say that they are often as dry as the remainder-biscuit after a voyage.

The Virginia Tourist. Sketches of the Springs and Mountains of Virginia. By Edward A. Pollard. (Philadelphia: J. B. Lippincott & Co.)—As soldiers fight their battles o'er again in years of peace, so our summer tourists relate by winter's fireside the story of their last summer's rambles by sea and by forest, and plan pleasure campaigns for the coming season. Such as these, seeking new fields to win, may find in Mr. Pollard's work the fullest information concerning one of the most picturesque of our American mountain regions. The value and the variety of the Virginia springs are both remarkable. The Sulphurs, white, red, yellow, blue, etc., etc., muster strong. The hot and the warm are really what they are labelled, and a plunge-bath in the huge octagon tank of the latter, with its depth of five and its diameter of forty feet, supplied by springs pouring forth a thousand gallons per minute, is something to remember. We speak from experience. The other springs—a legion of sweet, salt, alum, etc.—include every mineral and curative quality of which water is capable. The scenery is fine, the atmosphere healthy, air bracing, and we know of but one drawback to as much enjoyment as watering-places are capable of affording, and that is inferiority of accommodations—a defect which would probably be soon cured by a certain amount of Northern patronage.

Scenes of Wonder and Curiosity in California. A Tourist's Guide to the Yo-Semite Valley. (San Francisco: A. Roman & Co.)—This volume of some three hundred pages of carefully prepared descriptive text, illustrated with more than a hundred really excellent wood-cuts, gives us, if we except Prof. Whitney's "Guide," the clearest idea we have yet been able to obtain from books of the beauties and wonders of the Yo-Semite Valley. A residence of twenty years in California and of six years in the Yo-Semite must certainly have given the author abundant opportunities to know whereof he affirms. Not only the great valley, its big trees, its wondrous waterfalls, caves, and natural bridges are graphically placed before us, but other California curiosities, such as Mount Shasta, the New Almaden and Henriquita quicksilver mines, the Geyser springs, Lake Tahoe, and numerous other picturesque localities, are presented in a manner equally vivid and satisfactory.

Mr. Henry T. Tuckerman

Writes to the Boston Transcript:

"In New York, the practical precepts in regard to 'Health and Good Living' contained in Dr. Hall's book with that title, published by Hurd & Houghton, have produced a remarkable change in the habits of many people, who declared that they have got rid of their ailments by following this writer's judicious advice. We have heard of a lady eighty years old who declares that she has not been so well for twenty years; of a gouty *bon vivant* who has resorted to regular and moderate habits, and is thereby rejuvenated; and of a pale and fair devotee of fashion who has left off eating *confetti*, and recovered her bloom. No wonder the publishers sold fifteen thousand copies of the book in a few weeks!"

PORTER & COATES,

822 Chestnut Street, Philadelphia.

Longfellow's Poets and Poetry of Europe.

A New and Revised Edition, just completed, by H. W. Longfellow, with the addition of 150 pages of entirely new matter never before published, making it one of the most elegant and complete works extant. With Introduction, Biographical Notices, and Translations, from the earliest period to the present time. By Prof. Henry Wadsworth Longfellow. Illustrated with engravings on steel and engraved title. Imp. 8vo, cloth, extra gilt top, bevelled boards, $6; sheep, marble edges, library style, $7 50; half-calf, gilt, $9; Turkey morocco, $12.

"This valuable work contains selections from about four hundred authors, translated from ten languages. Mr. Longfellow himself gives us translations from all these languages but two."—Allibone's Dict. of Authors.

"This edition has been revised and enlarged by the author, and contains his last touches and additions to his labors."—The Age, Philadelphia, Nov. 3, 1870.

"It is now a better book than ever, the Professor having added an Appendix and a Supplement, the latter dated 1870, containing a very precious list of newer poetical translations. . . . The supplement is very choice and interesting, and absolutely rejuvenates the work. Here we have specimens from Bayard Taylor's translation of 'Faust,' not yet received in complete book-form, etc., etc."—Evening Bulletin, Philadelphia, Nov. 5, 1870.

Hedge's Prose Writers of Germany.

A NEW AND REVISED EDITION.

With Introduction, Biographical Notices, and Translations. By Frederic H. Hedge, D.D. With Six Portraits on Steel and Engraved Title. Imperial 8vo, cloth extra, gilt top, bevelled boards, $5; sheep, marbled edges, library style, $6; half-calf, gilt, $7 50; Turkey morocco, $10.

"There is no book accessible to the English or American reader which can furnish so comprehensive and symmetrical a view of German literature to the uninitiated; and those already conversant with some of the German classics will find here valuable and edifying extracts from works to which very few in this country can gain access." —Prof. A. P. Peabody, in North American Review.

"A new and beautiful edition of a work of sterling merit."—The Age, Philadelphia, Oct. 29, 1870.

"It is a photograph such as is very much needed at this juncture for instant study."—N. A. and U. S. Gazette, Philadelphia, Oct. 27, 1870.

"Universally recognized as one of the best collections of specimens of German literature in the English language."—New York Tribune, Oct. 28, 1870.

"Its merits and value are well known. In this enlarged edition it will be sure to find renewed favor."—Boston Post, Nov. 3, 1870.

In Press:

GRISWOLD'S PROSE WRITERS OF AMERICA. New edition, revised and brought down to the present time.

AMERICAN ORNITHOLOGY. By Alex. Wilson. With Bonaparte's Continuation. Colored plates.

*** Sent by mail, postage paid, upon receipt of price. For sale by all Booksellers.

NOS. 142 AND 144 GRAND STREET.

Oakley, Mason & Co.,

PUBLISHERS AND BOOKSELLERS,

Have removed from the premises occupied by them for a number of years past to

Nos. 142 and 144 Grand Street.

Richard Grant White's New Book.

WORDS & THEIR USES.

1 vol. large 12mo, tinted paper, price $2.

This is the most valuable treatise on the proper use of words ever published. Every intelligent reader should have a copy.

We will send the above by mail, postage prepaid, on receipt of the price.

SHELDON & COMPANY,
498 and 500 Broadway, New York.

NEW WORKS

PUBLISHED BY

Cassell, Petter & Galpin,

596 BROADWAY, NEW YORK.

SELECTIONS FROM THE WORKS OF THOMAS HOOD.

With Splendid Illustrations on Steel, by Birket Foster. 4to, cloth gilt, $10. (In a few days.)

PICTURES FROM ENGLISH LITERATURE.

The Text by Dr. Waller. Full-page Illustrations by E. M. Ward, R.A.; J. C. Horsley, R.A.; W. F. Yeames, A.R.A.; J. Gilbert, G. du Maurier, S. L. Fildes, W. Small, H. K. Browne, Mrs. E. M. Ward, J. D. Watson, Marcus Stone, W. Cave Thomas, F. W. Lawson, E. Wegner, R. Macbeth, E. Hughes, F. Barnard, etc., etc. Handsomely bound in cloth, color, and gold. $10. (Nearly ready.)

THE DORÉ GALLERY.

Containing 250 of the Finest Designs by Gustave Doré. Elegantly bound in cloth, $60.

CASSELL'S ILLUSTRATED CATALOGUE,

The finest ever issued, is now ready, price $1.

A NEW

Text-Book in Philosophy

Just Published:

OUTLINE OF SIR WILLIAM HAMILTON'S PHILOSOPHY. For the use of Schools and Colleges. By J. Clark Murray, Professor Mental and Moral Philosophy, Queen's College, Kingston, Canada. With an Introduction by James McCosh, LL.D., President Princeton College, N. J. 12mo, $1 50.

Prof. Murray was a pupil of Hamilton, and is distinguished as a teacher and writer. This work embraces the whole range of Hamilton's Philosophy.

Also,

NEW EDITION—BAMPTON LECTURES.

PROPHECY A PREPARATION FOR CHRIST. Bampton Lectures for 1869. By R. Payne Smith, D.D., Regius Professor of Divinity, and Canon of Christ Church, Oxford. 12mo, cloth, $1 75.

A work of marked ability and of great interest.

PROGRESS OF DOCTRINE IN THE NEW TESTAMENT. Bampton Lectures. By Thomas Dehany Bernard, Exeter College. 12mo, cloth, $1 50.

A masterly production.

Copies sent by mail, postage free, on receipt of the price. Published by

GOULD & LINCOLN,
59 Washington Street, Boston.

New York Eclectic Library,

129 EAST 17th STREET, NEW YORK.

27,000 Volumes, English, French, and German

PERIODICALS CIRCULATED AS BOOKS.

Open from 9 A.M. to 9 P.M.

MACMILLAN & CO.'S

NEW PUBLICATIONS.

JOHN WESLEY AND THE EVANGELICAL Reaction of the Eighteenth Century. By Julia Wedgwood. $2 50.

A SKETCH OF THE LIFE AND WRITINGS OF ROBERT KNOX, THE ANATOMIST. By his Pupil and Colleague, Henry Lonsdale. $2 50.

EUROPEAN HISTORY. Narrated in a Series of Historical Selections from the Best Authorities. Edited and arranged by E. M. Sewell and C. M. Yonge. Vol. II.: 1088–1228. Crown 8vo, $1 75.

New Volume of the Globe Series:

COWPER'S POETICAL WORKS. Edited, with Biographical Introduction and Notes, by the Rev. W. Benham. $1 75.

THE COUNTESS GISELA. From the German of E. Marlitt. $1 75.

AN INTRODUCTION TO THE OSTEOLOGY OF THE MAMMALIA. Being the substance of the Course of Lectures delivered at the Royal College of Surgeons of England in 1870. By W. H. Flower, F.R.S., F.R.C.S. With numerous Illustrations. Forming the First Volume of "Macmillan's Scientific Manuals for Students." Just ready.

MACMILLAN & CO.,
63 Bleecker Street, New York.

THE UNDERSIGNED beg to announce to their Friends and the BOOK-BUYING PUBLIC that they have established themselves at

451 BROOME STREET,

For the purpose of carrying on a

Bookselling Business,

Where they will be happy to see them and receive orders They will keep on hand a full Stock of the

PUBLICATIONS OF THE DAY,

Besides the

Works of Popular Standard Authors, Children's Books, Libraries, and Toy Books, etc.

Bringing with them *an experience of Twenty-seven Years* in the "Trade" in this City, they are prepared to transact a FIRST-CLASS business INTELLIGENTLY.

Bibles, Books of Common Prayer, Church Service, and Hymn Books of all Denominations,

In the various editions and styles of binding.

☞Orders from PUBLIC OR PRIVATE LIBRARIES, SUNDAY-SCHOOLS, OR CLERGYMEN will receive a LIBERAL DISCOUNT.

They will guarantee to all customers promptness and despatch in all business engagements.

Soliciting your patronage, we remain,

Yours faithfully,

DE WITT C. LENT & CO.,

The Nation.

NEW YORK, THURSDAY, NOVEMBER 24, 1870.

The Week.

THE principal event of the week at the French theatre of war is the battle fought on the 17th, near Dreux. It seems that after his victory before Orléans, General D'Aurelles de Paladines, having fortified his position near Chevilly, between that city and Artenay, began moving a part of his troops north-westward, in the direction of Châteaudun and Chartres, with the object of flanking the army under Von der Tann, on its right, and joining in an attack on the westernmost positions of the besieging army before Paris, to execute which French forces, belonging to the command of Kératry, had been transferred from Le Mans and elsewhere. To meet these movements, Von der Tann withdrew his troops from the line of Patay, Artenay, and Toury, on the confines of the Departments of Loiret and Eure-et-Loir, and, facing westward, occupied positions near Bazoche, Voves, and further north, on a line parallel to that of Châteaudun and Chartres. The First Bavarian Corps, which was marching to reinforce him, was arrested in its southerly movement at Etampes, and also faced westward, towards Ablis. The French forces, having formed a junction in the western part of Eure-et-Loir, advanced on the line of Châteauneuf and Versailles, passing Dreux, near which they were met by parts of the Fifth and Twelfth Corps, and other German troops, hastily gathered, under command of the Grand-Duke of Mecklenburg, from the armies before Paris or on march to reinforce Von der Tann. The result of the battle was the repulse of the French along the whole line, their hasty retreat beyond Châteauneuf, and the reoccupation of Dreux by the Prussians. Who was in command of the French—whether it was D'Aurelles de Paladines himself, Kératry, or some other general—what was the number of their forces, and what the loss on either side, we have as yet to learn.

The chief importance of the Prussian victory at Dreux consists in its securing the extreme and weakest lines of the besieging army, while Von der Tann—or his successor in command, if his rumored removal be true—is enabled to resume the offensive against D'Aurelles de Paladines, in co-operation with Prince Frederic Charles. The right wing of the army of the latter, consisting of the Third Corps, had at last accounts, in its march from the Moselle to the Loire, through Champagne, crossed the river Yonne at Sens, and was advancing to connect with Von der Tann in Orléanais, while its centre, the Ninth Corps, proceeded *viâ* Auxerre, obviously with the purpose of crossing the Loire between Orléans and Nevers, and operating in the rear of D'Aurelles de Paladines, on the shortest line to Tours. The French general, who is evidently conscious of the perilous condition in which this double approach places the Army of the Loire, tries in every way to fortify its main position in front of Orléans, and to secure and facilitate its retreat to the south bank of the Loire, while a fresh body of troops, designated the Eighteenth Corps, is collecting at Nevers, which may possibly offer some protection to his right flank, should he fall back on a point between Bourges and Tours.

The Prussian Tenth Corps, forming the left wing of Frederic Charles's army, advances through Burgundy towards the Saône, to join the forces operating under the command of General Von Werder. These now appear to be massed chiefly in and around Dijon and Gray, to have fortified Montbéliard and invested Auxonne, and to hold by their advanced posts a line extending from Dôle, on the Doubs, through St. Jean de Losne, on the Saône, to Nuits, at the foot of the Côte d'Or. The troops opposed to them, under General Garibaldi, in the vicinity of Autun and Creuzot, are reported to be in a state of paralyzing disorganization, owing to a want of harmony between the French and foreign officers, and a mutinous spirit among the men. Telegrams from Tours, however, announce a sanguinary surprise of a German detachment, at Châtillon (Châtillon-le-Duc, near Besançon ?), by Ricciotti Garibaldi, and also an obstinate, though indecisive, combat near Nuits, between three hundred Francs-tireurs against four times their number of Prussians. The news from the southern parts of France is considered in Tours to be more satisfactory than it has been for a time, order being re-established both in Lyons and Marseilles. In the North frequent fighting, though on a rather small scale, has been going on in the Department of Aisne, around Tergnier and La Fère, mostly with advantage to the Prussians, who are, besides, soon to receive heavy reinforcements, under General Manteuffel. The garrison of the last-named place has made some vigorous sorties, but in vain. More or less successful sorties are also reported from Mézières, Montmédy, and Belfort. From Paris there is no new warlike move to be recorded, attempted either by the besieged or by the besiegers.

According to all present appearance, General D'Aurelles de Paladines runs imminent risk of sharing the fate of the "Man of Sedan" and of Bazaine, unless he gets out of the way. A little too much tenacity—and this he is not at all unlikely to be forced into displaying—in trying to cover Tours—and Prince Frederic Charles will certainly "gobble him up," and that will be the end of "the Army of the Loire." Prudence seems to dictate a rapid removal of it and the Government to Poitiers, and, indeed, it is not at all unlikely that we shall hear of its flight within a few days. The fifteenth of December is now fixed, upon the best evidence, as the latest period Paris can hold out, but its surrender before the last moment is to be hoped for on grounds of humanity. Most intelligent Frenchmen have doubtless given up hope; but there is a state of mind which succeeds hopefulness into which great numbers of them are now passing, and which is perhaps respectable enough to take the guilt out of vain resistance, and that is a state of mind in which fighting on, without reference to result, seems a duty. There is, however, evidently not much of this. Most of the obstinacy is evidently due to ignorance and vanity and absurd expectations.

Count Bismarck has carried the negotiations with the representatives of the South-western States, relative to their union with North Germany, to a successful issue, though not in a way which can be said to be perfectly satisfactory to all parties concerned. The Grand-Duchies of Baden and Hesse-Darmstadt have joined the North German Confederation unconditionally, and the treaty admitting them as members has been signed at Versailles. To the two kingdoms of Würtemberg and Bavaria, however, concessions had to be made by King William, such as, perhaps, only the prolonged resistance of Paris, Von der Tann's check before Orléans, and the war clouds rising in the East, have persuaded him to grant. Würtemberg has secured special reservations in regard to its internal taxes, mails, and telegraphs, and Bavaria is even allowed to retain—in addition, we presume—"its military sovereignty and independent military organization"—under the supremacy, of course, of the Hohenzollern head of the thus enlarged Union, to whom, also, all representation abroad exclusively belongs. The conventions concluded will be laid before the North German Parliament, as well as a draft, which is now under consideration, of a new federal constitution. Thus Germany—in its narrower sense, that is, with the exclusion of the German provinces of the Austro-Hungarian Empire—may be said to be finally united. Whether its head is to wear the imperial crown is as yet not stated. The result of the recent elections to the Prussian Diet shows increased confidence in the Government. Dr. Jacoby, of Königsberg, the chief opponent to its annexation schemes, has been defeated.

The most prominent topic of discussion connected with the war during the week has been the question of Bazaine's treachery. It was first raised by Gambetta when he heard of the surrender of Metz, but, as far as he was concerned, was a pure falsehood, invented to support other falsehoods which he had been previously telling about Bazaine's cutting his way out to Thionville, and holding Prince Frederic Charles as in a vice. He knew nothing whatever of the facts at the time he issued his proclamation, and Bazaine, in a letter to *Le Nord*, a Belgiam paper, very properly pronounced the War Minister's charges "lying lucubrations." Since the surrender, "reports" and statements of various kinds have been flying about in every direction, throwing doubts on the Marshal's fidelity. The testimony as to the abundance of food during the siege is very strong; but, on the other hand, the testimony as to the broken-down and, above all, scorbutic appearance of the soldiers, except the Guard, at the surrender, is equally strong; and this would seem to dispose of the report that the Marshal refused to cut the rations down. His excuse for not cutting his way out is, that he had no artillery horses; but it is said, on the other hand, that he ought to have tried his luck before the horses were eaten up. But he did try it twice, and the heads of his columns were swept away by the Prussian fire long before they reached the besieging lines. The other plans by which he might have got out if he had tried, with which the newspapers are filled, are hardly worth discussing. The number of men who can extricate any army from any scrape, if you only give them a quire of paper, is prodigious, but it is hardly fair to condemn any soldier on their certificates. The theory on which Bazaine is accused is, of course, that he was hostile to the Republic, and wished to save the Empire; and that he expected the Provisional Government to make peace after Sedan, and then he would march out the only unconquered leader. There may be something in this, and there may not. One is prejudiced against it by the fact that Gambetta has accused all the officers of the regular army of treasonable devotion to the "Man of Sedan." If the French army was what he describes it, his trying to make a new one was a crime. He ought to make peace, and go to work to get up a new code of national morals.

The cloud of war raised by Gortchakoff's circular has not altogether passed away. Earl Granville has opposed a peremptory refusal to the Russian application for a revision of the Treaty of 1856, on the ground that, however unreasonable the restrictions placed on Russia may be, one party to the treaty is not to be permitted to throw off the obligations it imposes without the consent of the others—using arguments with which the discussion of the State-rights question in this country has made most American readers familiar, but which probably strike English readers now as much more forcible than they did in 1861. To this Gortchakoff replies, that the treaty has been already violated two or three times by the intrusion of war vessels into the Black Sea, and by the election of a Prince by the united provinces of Moldavia and Wallachia, and that, in any event, it is impossible just now to summon a congress, so he must have his war vessels in that sea without further delay; but he is conciliatory in tone, and disclaims all hostility to Turkey. There would be a stronger probability of a peaceful settlement than there is, and we do not say that such a settlement is yet improbable, if England could afford to yield; but owing to the terrible damage sustained by her reputation through her submissiveness about the Danish question, and the singular readiness which Prussia has shown to quarrel with her over the exportation of arms, she will doubtless have to fight, *nolens volens*, to save herself from contempt or worse. If Austria kept out of the fray, war would probably be remote, but she must go into it as a matter of life, and Italy's attitude is still doubtful, but she will probably be tempted by the glory of the thing and anxiety to make her début as a first-class power. The chances of peace, however, improve with delay, and if the negotiations can be kept going till the fall of Paris, a general congress will furnish the disputants a ready escape from a very embarrassing position.

The serious character which the Russian affair evidently at one time assumed in the eyes of European finance and commerce, was reflected here in an advance of four per cent. in gold, a slight fall in Government bonds and in cotton, and a rapid and excited advance in breadstuffs. More than one-half of these changes has, however, been lost again, and so far the influence on our markets has been extremely limited. It would be difficult to furnish a better illustration of the listlessness, or rather total absence, of speculation. Stocks have, in the main, been lower, in spite of various combination schemes. Money continues easy, but with occasional evidences of a diminution in general confidence, which is not altogether without justification. Several failures in the whiskey trade, and others both abroad and at home, create a certain amount of uneasiness. The woollen and iron trades complain of depression, and several mills and foundries have temporarily stopped work, while, at the same time, strikes are reported in various directions. Coal continues dull and weak, though without material decline. The condition of the real-estate market is attracting renewed attention, owing largely to the poor success of an attempted auction sale of a large amount of choice city property. Business generally, though light, is sound and steady, and appears to be settling down more and more to the quiet dulness of extreme regularity.

The Spaniards have at last got a king in the person of the young Duke of Aosta, and it must be confessed that, although he is not a person of remarkable ability, nor likely to have much power, he has in him, in having been bred at a constitutional court, the materials of the best ruler the Spaniards have had for many a long day. That any great change in the character of the Government will take place soon is not to be hoped for; this must come, not from a change in the dynasty, or rearrangement of the machinery, but from the spread of education and growth of industry. If the new régime makes roads and establishes schools, it will do all that can, for the present, be expected of it. If the Spaniards could only have picked Aosta out six months ago, what millions of treasure and torrents of blood would have been saved; and yet how much less hopeful and satisfactory the state of Europe would have been than it now promises to be.

The Cox controversy has been slowly dying out in spite of a feeble supplemental "explanation" from the President, which contains nothing new. It will probably now remain where it is till Mr. Cox's report appears next month. This will, we believe, furnish some tid-bits about the condition of the civil service in Washington. The Philadelphia *Press* has, however, we are glad to say, continued its onslaughts on civil service reform. Colonel Forney declares of it that "it is a self-evident falsehood," and "fraud upon the government," and that "the American people will none of it." Yes, they will—begging the Colonel's pardon—and, what is more startling still, the Colonel himself will yet defend it fiercely in his own terse English, in this same paper. The Indianapolis *Journal* has also taken up the same ground, and abuses Cox handsomely. It says, by way of defending "rotation in office," that the new clerks form a kind of "investigating committee," and find out what tricks their predecessors have been guilty of. This is certainly true up to a certain point, but then as soon as the "investigating committee" has discovered the tricks, the members begin to practise them themselves, which makes it difficult to see what the country gains by having them found out. The Boston *Advertiser*, too, has come to the defence of the President, and says there is nothing whatever in the charges against him; that he is all right, and that his assailants ought to be ashamed of themselves. All his defenders, however, would have done well to have followed the example of the best and shrewdest newspaper friends he has—the New York *Times* and *Tribune*—and have preserved a strict silence about the whole matter. That is the best way to confound the "Coxites." The *Tribune*, by the way, did speak once. Mr. Lewis Dent, the President's brother-in-law, and one of the McGarrahan counsel, having been accused by somebody of having gone to Long Branch to procure the McGarrahan letter, denied it. Whereupon the *Tribune* called attention to his denial, and said the public might judge, from the way this charge had broken down, of the value of the attacks recently made on the President.

There is one thing this controversy reveals pretty clearly, and that is, that the amount of support which the friends of reform will receive on the matter of civil service from men, and even from journalists, who have ever held office, and who expect to hold it again, will be very small. They are all in favor of civil service reform in the abstract, but when it comes to taking any practical steps to bring it about, as Rip Van Winkle says, "they swear off." But the recent uproar has at least developed a show of zeal, and Mr. Boutwell has been driven into publishing a circular issued by him for the government of the custom-houses, in June, 1869, which directs a *bona-fide* examination of every candidate for a place, and a competitive examination where there are several candidates for one place; and the Boston *Advertiser* says "it is assured that similar instructions have been given, and *are enforced*, in every bureau under Mr. Boutwell's control." We are glad this astounding assertion has been made, because it will give the friends of reform an opportunity either of doing justice to a much maligned man, or calling public attention in a very telling way to the nature of the devices by which attempts to bring about real reform are foiled. But we venture to predict that Mr. Boutwell will sorely regret having made it before he hears the last of it. He has uncovered his flank.

Indeed, there seems to be a general agreement among the supporters of the new régime at Washington, from the President down—well, to say things which put the public in a very embarrassing position. For instance, we now have three different reasons given us in succession why General Grant interfered with the course of law about the McGarrahan claim. The first was that he had "suspicions of Wilson;" the second, that he wished to reserve the matter to be disposed of by Congress; the third—evidently suggested by Butler, who puts it forward in his late letter—that he wanted to keep the property for the United States. Among the numerous collateral fabrications got up in aid of the Administration, and one of the most impudent, is the story that the signers of the New Haven letter are sorry, and, if it was to be done over again, would not sign. The reasons for writing such a letter have indeed grown stronger by far under the President's defence than they were when it was written. We think we can safely promise all who have sympathized with Mr. Cox, and supported him, a set of "exposures" during the coming winter which will make him seem more remarkable for forbearance than for anything else.

General Butler has appeared on the scene during the week in two characters. One is as a witness in the Cox case. He testifies as a Member of the Judiciary Committee that the McGarrahan claim was not well founded, but adds that Cox seemed to him "quite desirous apparently to give a patent to the Idria Mining Company," the whole letter, we have little doubt, being written for the express purpose of bringing this insinuation in, which, of course, has just what force the character of the person who makes it gives it, and no more. He is also coming out as a lecturer on the *Alabama* case, but repudiates the report of an "interview" with him, which went the rounds of the papers a week ago, and in which he said the Republican party was going to the dogs, and would die unless "capital" was made for it; and that the way to make capital for it was to get up a quarrel with England about the *Alabama* case and the fisheries. Finding this did not take well with the public, he denies its accuracy, and says he is going to explain himself more fully; but the New York *Tribune* tells him that it will prove that the report *was* accurate, and that he must be careful. The spectacle of a Christian public buzzing about a personage like the General, waiting for his "views" on war and peace and political morality, is not pleasant even when one knows how small his influence is.

A well-informed correspondent writes to say he thinks we have overestimated the strength of the "Labor Reformers" in the recent election in Massachusetts. He says the Phillips vote was largely made up of Republican malcontents, who gave them to Mr. Phillips instead of Mr. "Scattering," and that this element would have been much larger but for his speeches. The best test of the strength of the Prohibitionists and Labor Reformers was to be found in the vote for the Lieutenant-Governor, in which the former polled, less three towns, 6,475; the latter, 9,454—in all, 15,929. Take this from the total vote, and we have a residuum of 5,817, composed of Republican discontent, which Mr. Phillips's speeches had not been sufficient to dissipate, although towards the close of the canvass, under the influence of a severe punching from Mr. Bird, he became quite philosophical and soared into the upper air of reason, in which he says he usually dwells. *Persons* don't interest him or attract his attention; and when he does notice them, he is always careful to state the naked unadorned truth about them. When he said, for instance, in the late canvass, that the Springfield *Republican* had acted as the "tool of Vanderbilt" in its opposition to the Hartford and Erie swindle, let no one suppose that he invented that story on the spot as a good, spiteful, telling thing to say of a troublesome opponent. Far from it; Vanderbilt must have submitted to him proof of the whole transaction, the very agreement, and the sum paid to the *Republican* as the reward of its corruption, or Mr. Phillips would never have given circulation to the charge. We hope the moral of the whole affair will not now be lost sight of. It is the danger of allowing one's self, no matter how highly gifted, to become a mere Tongue, and go about wagging and wagging for the popular entertainment, without regard to memory or judgment or conscience. No Tongue can be trusted to behave properly if left to itself in this way. It is sure to get into a scrape and disgrace itself, no matter how silvery it is or how much people like listening to it. We are sorry to say, however, loose, masterless Tongues are multiplying; we hope this Boston scrimmage will scare some of them home and make them see the propriety of taking service under good, honest brains.

It turns out that the amendment validating—conditionally, as we showed last week—the municipal railroad bonds in Michigan, has been defeated by a majority rising 20,000; and that in fact the only amendments which were carried were those providing for legislative regulation of railroad charges, and prohibiting the consolidation of competing lines of railway. Even the word "white," no longer anything more than a superfluity in the constitution, was ordered to be kept standing by a majority of about three thousand votes, neither party polling its full strength over this issue. Nothing is more capricious than the fate of amendments in this country, but the public apathy in regard to them may be counted on if they do not involve party issues, or, as in Michigan, touch directly the voters' pockets. The usual striking disparity between the vote for candidates and the vote on amendments submitted at the same election, may be taken, on the one hand, to prove the exaggerated estimate of the value of such amendments as instruments of progress; and, on the other, of the unthinking, almost purely personal, character of our politics. If anything like the pains were taken to enlighten the people as to the nature and reasons of these changes which are devoted to party abuse and the blackening of reputations, there would be less frequent need of tinkering our constitutions, and they would prove about as serviceable at one date as another.

While New Hampshire has lost in population during the last decade, the Southern States which participated in the rebellion have all increased, however slightly. In material condition they are fully as well off as in 1860, and their prospects are indefinitely better, and devoid of all illusion. They are no longer to be pitied or sympathized with, or pointed out as examples of the effect of Yankee rapacity and tyranny. They have, to be sure, a carpet-bag legacy which is not to be got rid of in a moment, but which they are as rapidly disowning as circumstances will permit. They need now, more than anything, an influx of emigrants which shall give them something like their due ratio of inhabitants to the square mile; and they would do well, we think, to imitate such a combination as that of the North-western States, whose governors met in convention on Wednesday to see what could be done towards putting immigration upon a national basis. The experiment of placing Chinamen at the South seems to have been self-limiting, and is no longer depended upon as a panacea. At the North it is found difficult to obtain a supply of this kind of labor equal to the demand, and the "Chinese problem" has been postponed without day. The negroes have in the meantime been multiplying instead of dying off.

THE POLITICAL SITUATION.

There has been a good deal of uproar during the week in the political arena, arising partly out of the audaciously insubordinate tone of the Gratz-Brown Republicans in Missouri, partly out of the indignation caused in the Republican ranks by Mr. Cox's resignation, and partly by certain articles in the Chicago *Tribune*, indicating a belief that the Republican party was falling far short of satisfying the needs of the times, and that some new organization would have to take its place, and hinting that the Democratic party had what the Republican party has not, and yet what any party must have to command the popular confidence—something positive in its policy—on the tariff question, for instance. The New York *Evening Post* has increased the tumult by a summing up of the results of the late elections, which shows that while in 1868 and 1869 ten Southern States were Republican, and only six Democratic, in the elections this fall only two are Republican, three have not voted, and the remainder, which are now Democratic, were two years ago Republican. The *Post* draws the conclusion that things are not in a good way with the Republican party when the scales can thus be turned against it in regions in which the influence of the Administration is unusually powerful. The New York *Tribune*, which is a firm supporter of the Administration, replies on the other hand that the *Post* is a base and cunning deceiver; that the reason why some of the Southern States have gone against the Administration is, that since the last election the rebel element in their population has been enfranchised; why others have gone is "the improvident and profligate" local legislation of the Republicans; but it admits the main fact—and that is, that for one reason or another the result is pretty much what the *Post* has described—viz., the States in question are now Democratic, instead of being, as they were, Republican.

There is no comfort to be got from the fact, if fact it be, that the Democratic majorities at the South are due to the readmission to the franchise of "ex-rebels." The important point for consideration is, that the "ex-rebels" are in, and cannot be got out; and that any party which hereafter proposes to administer the Government of the United States will have to take notice of their presence and of their power. The Republican party will have either to secure strength enough elsewhere to defy them or to win them over. The last it is certainly not at all likely to do; can it do the first?

The answer to this question, of course, will depend in the main on the amount of importance one attaches to the dissatisfaction which is showing itself in the party ranks at the North. There is no disguising the fact that there is a widespread belief, which grows stronger every week, that the party is sharing the fate of all parties which have been long in the enjoyment of great power, and has become deeply tainted with corruption. This impression has been greatly deepened and diffused during the past few weeks by the revelation that some of its most notorious and oldest "corruptionists" have risen into favor and influence at the White House, and are able to make the departments too hot for their enemies. The gravity of this fact is aggravated in the public mind by the circumstance that these worthies are "Pennsylvania politicians"—a species on which the country has long looked as something unrivalled in its line, and whose attempts on the President when he came into office filled all his best friends with alarm. Besides the distrust which springs from this source, and which is exceedingly strong amongst a large class who, though they do not call at newspaper offices "to talk things over," show themselves in considerable force on election day, there is a feeling, perhaps less respectable than the one we have been discussing, but which, nevertheless, has its weight, and which may be best described as weariness of the party and its works. People are growing rapidly tired of "its glorious record;" they are growing tired, too, of its "economy" and of "its fidelity to the great principles," etc. They ought not to grow tired of these things, but they do. The number of those who have a slight sensation of nausea when they hear an orator touching on them is increasing alarmingly. There is a growing demand for something more positive, something that promises more immediate results in the way of increasing people's comfort and giving them objects of active interest, than Mr. Boutwell's purchases for the Sinking Fund. The prospect of funding at a lower rate of interest, too, appears to many too small to be even worth discussion. The party is absolutely suffering, not from apathy, but from *ennui*. It is literally being *bored* to death by its managers.

We say it is not suffering from apathy in any proper sense of the word, because we doubt whether eagerness for reform, and for energetic reform, was ever so widespread as it is at this moment. People have recovered from the excitement of the war against slavery, and have begun to look closely about them, and the state of things which meets their eyes is by no means satisfactory. They find themselves saddled with a tariff of extraordinary complexity, which touches thousands of articles, and is full of snares and absurdities; they find that, though its supporters declare it to be the best tariff that ever was, it is taken up every winter regularly by these very persons, and overhauled from top to bottom, tinkered and patched and modified, under the instigation of a powerful and insatiable lobby, to the great disturbance of business, and to the serious injury of the national industry. They find the collection of the national revenue—that is, the transaction of the national business—committed to a body of men from whom not only no guarantees as to character or capacity are exacted, but who are furnished by the very nature of the system under which they are appointed with every conceivable temptation to dishonesty and idleness; and they are told by a competent observer that about a fourth of the national income is stolen or lost in the process of collection. They find the State legislatures, especially in the East, becoming, one by one, terribly corrupt, and passing rapidly under the control of the great "rings" of wealthy and unscrupulous jobbers, whose combinations are taking complete possession of all the great joint-stock enterprises, the railroads, telegraphs, expresses, and rising rapidly above the jurisdiction of the courts. They find the character of the judiciary seriously deteriorating in the very regions in which judicial integrity is of most consequence—the great centres of wealth and population. They find the schools, the prisons, the charities of the country, gradually slipping away from the hands of the men who make these things the object of humane and *scientific* pursuit, and passing more and more into the hands of political charlatans, to whom a school or prison or workhouse is only interesting as a place in which they can find places for a certain number of party hacks. They find, too, that in these, as well as in the post-office and various other important branches of administration, the separation between the intellect of the nation and the practice of the art of government is growing yearly wider, and that in many of them Europe, which once copied us, has far surpassed us. The condition of the prison of Sing-Sing would fill any European jailer with horror. Our post-office is a mediæval contrivance compared to the British, and our schools fall far below those of Germany in the *quality* of the instruction and in the proportion of the national children which they lay hold of and train. The institutions which are rapidly gaining, not in wealth only but in power and efficiency, are the universities, but this is unanimously ascribed to the providential arrangement which has deprived the Government of control over them.

Behind all this, we have the nation growing rapidly in knowledge, skill, riches, and ambition—its experience widened, and judgment strengthened, and perceptions sharpened, by the tremendous contest from which it has just emerged; and when its best men look about for work to do in the setting of its affairs to rights, they find the only thing that offers is the blowing of a blast against alcohol and tobacco, or the composition of weak drivel on female suffrage. If anybody supposes people are content with this state of things, or will long put up with any party which offers them no way out of it, but asks them to content themselves with the contemplation of Mr. Boutwell's Sinking Fund, or the increased receipts from the whiskey tax, he is greatly mistaken.

What will be the result of this dissatisfaction as regards either the Republican or Democratic parties, it would as yet be hard to determine, and we doubt if anybody is competent to throw much light on the subject. Those who flatter themselves that they will find in the Democratic party the reformatory spirit and agencies that they seek, have as yet not shown any good grounds for their faith. We have yet to see the slightest sign of a progressive tendency in that quarter. Its declarations in favor of free trade strike one rather as little balloons sent up to ascertain how the wind is blowing, than proof of a hearty adoption of a financial policy. For civil service reform, or any other reform, it has not yet said one word. Wherever it holds the reins, its corruption surpasses anything hitherto seen in that field. Moreover, we doubt whether any party ever has departed or can depart in its policy from its essential principle, and the essential principle of the Democratic party is hostility to change. It has existed for nearly twenty years simply to resist change; to ask it now to become an instrument of change, and of great and sweeping change, is asking something which its very nature forbids. Its muscles are not made for that kind of work. Its strength lies in holding on or standing still.

Whether a reformer will fare any better in the Republican party still remains to be seen. The only thing certain thus far is that, if it means to exist, it must move on, that it cannot continue to live on Democratic baseness and the glories of its own record, that it must provide positive reforms. But we doubt much whether it is as yet the duty of reformers to trouble their heads with the consideration of the question whether it *will* provide positive reforms, or what will happen if it does not. If they succeed in so working on public opinion as to make the demand for reform loud and imperative, either the Republican party will satisfy it, or else something will rise up in its place that will satisfy it. It is for the friends of reform just now to sow the seed; but there is no occasion to squat down, and watch for the sprouting of the corn, or to vex themselves about the supply of reapers.

THE TURCO-RUSSIAN TROUBLE.

It has been believed for some time that there existed an understanding between Prussia and Russia, by which the latter was to be permitted to get what advantage she could out of the Franco-Prussian struggle, as long as she did not interfere in it herself, or permit interference in it on the part of any other power. Accordingly, she has had no hesitation in letting it be known that if Austria meddled in it she would meddle too, though probably not on the same side, and that she would certainly expect a revision of the Treaty of 1856 as one of the consequences of the war. The only thing about which there has been any doubt in diplomatic circles has been the time and manner in which she would present her demand for a removal of the restrictions on her in the Black Sea. It had been generally supposed that she would not take any steps in the matter till the close of the war; and the sudden appearance of Prince Gortchakoff's note, and, above all, its somewhat peremptory tone, have, therefore, created something like a panic on the European exchanges.

There are, however, various strong reasons for believing that the matter will either be arranged peacefully now, or that, if it is not arranged peacefully at once, war will not come of it immediately. In the first place, it appears probable that England, if she has to fight, will not fight alone, as a good many people have supposed, and that, even if she were to contribute no land forces to the fray, Russia would still be confronted by 700,000 or 800,000 Austrians, Turks, and Italians, who, instead of having to assail Russia, always a difficult task, would simply have to await her onslaught; and for offensive operations the Russian army has in these later days shown singular incapacity. Austria, too, torn as she is by domestic dissensions, and with a financial status of unusual complexity and embarrassment, is really more formidable as a military power than she has been at any time in the last half-century. Her army has been reorganized; the popularity of the reigning Emperor is greater than any member of his family has enjoyed since Maria Theresa; she has no Italy; and, what is more important than all for military purposes, Hungary is not only loyal and devoted, but may be said to manage the resources of the empire. The great source of the military weakness of Austria, next after the possession of Italy, during the last half-century, may thus be said to be removed; and Hungary owes Russia a grudge which would give unusual bitterness to a contest with her. What the effect of the Panslavic idea, and of the differences with Austria on the score of administrative autonomy, would have on Bohemia and Croatia, it is hard to say with any certainty, but it seems safe to conclude that absorption in such a tremendous centralization as Russia would be fully as repulsive to them as subjection to German and Hungarian domination. From the latter there is good hope of deliverance; from the former there would be none. With Austria, too, the struggle would be one of life and death. The appearance of the Russians at Constantinople would mean for her, since the events of 1866, total and rapid destruction, and would mean for all the Danubian races the complete extinction of the hopes of separate national existence, which have been growing rapidly amongst them since 1856, and which have almost entirely superseded the abject fear of the Turks which made former attacks on Turkey by Russia so welcome. Whatever the attitude the Bosniacks, Bulgarians, and Servians, or Moldo-Wallachians, might take up towards Turkey, in case of a convulsion in Eastern Europe, there is not much probability at present that it would lead them into an active support of Russia; and without their active support, or even with it but in the absence of the control of the Black Sea, an advance on Constantinople is, we repeat, impossible—and the Russian generals of course know this better than anybody else. Whatever power holds the Black Sea can throw an army in the rear of any force attacking Constantinople in a few days by steam. In other words, the conditions under which the last invasion of Turkey took place, in 1828, are completely changed, and for the worse, and that one was very near ending in disaster. In short, a war now would very much resemble the war of 1854, minus the battle of Alma and the siege of Sebastopol.

The demand of Russia that the Black Sea be again thrown open to her fleets is one, therefore, which it seems to be in the power of England or Turkey to grant or refuse. There are only two ways of introducing a Russian fleet into it—one is by building and launching it, and the other is by bringing it up the Dardanelles. The story of the fifty iron-clad monitors ready for sea at Nicolaieff is still only a story—probably issued in support of the negotiations, though there is no doubt that dockyards exist there. The work of building a fleet is, even if the facilities for it existed, one of years, and entrance by the Dardanelles by force would of course be out of the question. Indeed, one of the first results of the outbreak of hostilities would probably be the disappearance of the Russian fleet from the Mediterranean and Baltic, to take refuge under the fortifications. All this leads us to the conclusion that Russia will not attempt to solve the problem by force; and this view seems to be strongly confirmed by both of the Gortchakoff despatches. He is very careful to repudiate all intention or desire of reopening the "Eastern Question" or menacing the independence of Turkey, and evidently hopes to attain his object rather by exciting uneasiness than by an actual resort to force.

As regards the legitimacy of the Russian demands, there can be no doubt that the point made by Earl Granville, that it is not permissible for one of the parties to a treaty to release himself from its obligations whenever he is pleased to declare it no longer binding on him, is well taken. Any other doctrine would make all treaties a mere formality, and would give international agreements very much the same character as Mrs. Cady Stanton's marriages. Indeed, there would be something ridiculous in carrying on negotiations for the mere purpose of getting the parties to agree to do this, or refrain from that, as long as they thought proper. Where nobody is bound, there is no contract; and nobody is bound in any transaction who retains the right to act in accordance with his own inclination. It may be said that all treaties are broken, sooner or later, by the refusal of one of the parties to abide by them; but then there is a wide difference between saying that they have not all the force they ought to have, and saying they have none at all. The theory, too, that the observance of a treaty imposed by force ought not to be expected after the vanquished feels strong enough to abrogate it, if generally adopted, which we are glad to say it is not likely to be, would give a peculiarly horrible character to war. In fact, we see in the case of France a striking illustration of its practical working. It is the firm belief of the Germans that France, in her rage and mortification, will not abide by any terms that may be imposed on her by the conqueror one minute longer than she can help, which drives them into weakening her by every means in their power, and which is put forward by Germans as the principal justification of the annexation of Alsace and Lorraine. A similar policy would be pursued under similar circumstances in other cases. Every victor, knowing he could expect neither peace nor security from the plighted faith of the vanquished, would devote himself, might and main, to the work of dismemberment and destruction, so that, however much the enemy might wish to attack him again, as long a time as possible should elapse before he had the ability to do so. Wars would thus be indefinitely prolonged, and their evils greatly aggravated. The doctrine is, however, absurd as well as impolitic. A power which appeals to arms for the decision of a controversy, *ipso facto* pledges itself to abide by the decision when fairly ascertained. If the sword did not play the part of an arbiter, and its decisions were not accepted as those of an arbiter in the forum of international law, war would be simple savagery, in most respects far more revolting than the conflicts of wild animals. It is a means—a horrible and barbarous means, we admit—of defining the relations in which political communities should live to each other. If people who appeal to it, as Russia did in 1853, and as France did in July last, say when they are beaten that they will not be bound by its decisions unless their antagonist keeps his foot on their necks, their fighting stands on the same moral level as the scratching and biting of a parcel of tom-cats.

On the other hand, both in imposing terms of peace and in insisting on their observance, allowance has, as in all other things, to be made for the weaknesses of human nature. It does not do to impose too severe a strain on people's pride, particularly when they believe they have the means of protecting themselves against humiliation. There is no doubt that the Russian arsenals and dockyards at Sebastopol were prepared, through long years, for the purpose of assailing Turkey. The Black Sea fleet which was destroyed at Sebastopol was too outrageously disproportioned to any danger of attack which the Russian coast ran in that quarter, to make all talk of it as a protection anything but absurd. Its destruction was therefore a legitimate object and necessary result of a war undertaken to repel an attack on Turkey, and the neutralization of the Black Sea was as good a means as could have been devised of getting rid of the danger for some time afterwards. It would be well for mankind if every sea and ocean in the world could be neutralized in the same way. But it was and is useless to expect that the present generation of Russians, which is undoubtedly more occupied with the work of internal reform and development than with the solution of "the Eastern question," and which certainly does not buoy itself up with the fanatical hopes with regard to the possession of the Bosphorus which the Emperor Nicholas cherished and diffused, and made it the business of his life to try to realize, will quietly sit down much longer under a restriction of which the reasonableness is less apparent than when it was imposed, and which, in depriving a great power of the right to keep armed vessels in a sea which is half enclosed by its territory, is a standing humiliation. The greater the humiliation, too, for Russia, the more necessary it was for the other signataries to avoid even such formal and technical breaches of the Treaty of 1856 as the entrance of armed vessels in the cortége of the Sultan and Prince of Wales and Emperor of Austria. The point raised with regard to Roumania is of the same character—technical, but in the mouth of a proud nation strong. The whole matter can and will, we have little doubt, be arranged by a general congress; but no arrangement of it will be final or successful which does not set up at Constantinople a government which has some moral claim to respect. It is the utter absence of any such claim on the part of Turkey which makes the pretensions of Russia really dangerous. Nobody who has any hopes for the political and social future of the vigorous races which people her European territory can wish to see them handed over to Russia, whose system, good enough for herself, is after all a Cæsarism, with a touch of "divine right" in it, and which, set up in the Levant, would blight regions whose share in European civilization is only beginning, and to whom the very *insouciance* and shiftlessness of their Turkish masters have given already a remarkable amount of training in self-government.

THE FEUD IN THE WOMAN'S RIGHTS CAMP.

WE spoke some weeks ago of the advanced ground taken up by the *Revolution*, the New York organ of the Woman's Rights Movement, with regard to the ballot; it relegated it to a subordinate position in the list of rights, and treated it as simply a means to the general emancipation of the sex. We also spoke of the still more advanced position taken up by Mrs. Cady Stanton, the mother of the movement. She is, she declares, in favor of unlimited freedom of divorce—that is, to all intents and purposes, the abolition of the marriage contract—for where there is no bond, there is no contract. We also spoke of the doctrine put forth by the *Woman's Advocate*—an interesting and ingenuous periodical, sometime published at Dayton, Ohio, but lately merged in the *Woman's Journal* of Boston—that marriages might, with great advantage, be contracted for limited periods, say two or three years, leaving their renewal to depend on the pleasure of the parties. When we spoke of all these things, we little thought that they were soon to become the cause of a savage encounter between the New York and Boston organs. We were the less prepared for it, as we were ourselves sharply rebuked by the *Journal*, and even accused of fraud, for having allowed a lady to say in our columns, what we had already said ourselves, that the movement must inevitably touch upon the questions of marriage and divorce, and that no attempt to deal with woman's condition in society can pass these questions by. The *Woman's Journal* repelled these insinuations with all sorts of unpleasant remarks. Within a very short time—we will not be so cruel as to say how short—we found the same paper rebuking the New York brethren and sisters for touching "marriage, divorce, and deficiency of offspring;" but we still supposed that some means would be found of repairing the breach.

But things went on from bad to worse. The *Journal* has at last denounced Mrs. Stanton, and shows in an article which there is no confuting that free divorce means free love, and free love means "free lust." The *Revolution* replies in a savage attack on the *Journal*, and says there is "free love" in this enterprise also, owing to its absorption of the *Woman's Advocate* aforementioned. Mrs. Stanton, too, publishes a scathing letter on the Boston branch, and is especially cutting in her remarks on Colonel T. W. Higginson, who, she says, is the real head of the concern, Henry Ward Beecher being a mere man of straw. Considering what mighty interests are imperilled by this unseemly quarrel, we must say that we think it was a little premature for the New York branch to send a female "peace advocate and commissioner" to Bismarck and Jules Favre, and for Mrs. Howe, of the Boston branch, to "declare war" against the former because he would not make peace with the French on her terms. Think of what unholy merriment there will be at the Prussian headquarters when the recent numbers of the *Revolution* and *Woman's Journal* are laid on the breakfast table, and the King's aid-de-camp translates the leading articles to the assembled company. Fancy how Von Moltke's ribs will shake when he hears his brother-warrior, Colonel Higginson, described by a fellow-laborer as "a neat and dapper reformer and rhetorician, and an *ex cathedrâ* authority on dress, manners, and culinary utensils." A nice reception "Mrs. Emilie J. Merriam" will find awaiting her now when she is brought in from the outposts by the Uhlans, "with her grave considerations of peace." Humanity may well veil its face and wail when it thinks upon these things.

But we confess that, although we think the *Journal's* doctrines about marriage are the sound ones, we have no doubt that Mrs. Stanton's are the more popular, and that the *Revolution* has a far mightier future before it than its Boston contemporary. The reason is obvious. The *Revolution* and Mrs. Stanton have a distinct prospectus, and promise to make very important changes in woman's condition if they get a chance. A state of society in which a wife could any morning tell her husband she was going to leave him that day for good, or in which a husband could make a similar communication to his wife, without any fear of interference from the law or censure from their neighbors, as the exercise of a simple natural right, like the choice of clothes or perfumes, would, it must be admitted, be a state of society differing profoundly from any state of society with which the civilized world is at present familiar. But a state of society in which the number of voters, of platform orators, and of newspaper writers and readers was double what it is now would not, as it appears at present to the carnal eye, differ so much from that in which we live as to offer anything very attractive by way of change or variety; and this is all the *Woman's Journal* as yet promises to an afflicted and deluded world as the result of the success of its labors. To be sure, it mentions many great blessings as likely to flow from female suffrage, but then all its speculations have such a strictly *à priori* basis, are so entirely the product of the graceful imagination of the Boston Association, that the attention of the average man, and woman too, is too readily drawn off from them by the more substantial attractions offered by the New Yorkers. In fact, the *Revolution's* plan has all the advantages for purposes of proselytism over the *Journal's* plan that Mahomet's paradise has over the Christian heaven. The advantage of having as many wives in succession as one pleases is obvious at a glance; the advantage of having the young men go to the polls with the girls, to the sound of music and amid the perfume of bouquets, is much more remote and shadowy. Moreover, the *Revolution* enjoys in its present advanced position the immense advantage of being more radical than its opponent. In the boundless field of *à priori* politics, the fastest runner always commands most popular favor, while the laggard, who picks his steps, and measures his paces, and sits down on the knolls to look about him, speedily becomes an object of distrust and even of contempt. To get and keep well in advance is indeed the one condition of success; and this condition, as it seems to us, the *Revolution*, and the *Revolution* only, fulfils. When you propose to give woman complete freedom, and yet leave the marriage contract binding, you mock all the wives of the land. When you proclaim your intention to make simple inclination from day to day the basis and the only basis, of the matrimonial relation, then you are indeed an emancipator; and this the *Revolution*, or, at least, Mrs. Cady Stanton, who leads the *Revolution*, does.

The *Woman's Journal*, on the other hand, promises us nothing but a generally improved condition of society as the result of women's participation in legislation. Now, whether women's participation in legislation will improve legislation will depend, as the most stupid can see, on the amount of knowledge, logic, good sense, patience, and self-control that women bring to the work. Accordingly, the public has been long looking for some better reason for believing that all the fine things the *Woman's Journal* predicts are really going to happen than the *Journal's* own assertion and that of the sages who appear at the Woman's Rights conventions. The thing in the nature of proof which it asks for most eagerly, is some specimens of woman's work in the shape of sober discussions of the questions of the day—in other words, the very questions with which women will have to deal when they come to legislate. It would like, for instance, to see a paper conducted solely by women not made up of cackle about "the progress of the cause," "words of cheer" from Hattie or Minnie, weak denunciations of tyrant man, hysterical rejoicings over Maggie V. P. Comstock's success as a lyceum lecturer, and high-flown eulogies on "love," but of thorough discussion of the subjects with which women will be called on to deal whenever they begin to vote, and with which it will be a great public calamity for them to deal without understanding them.

People, in short, in order to be convinced that the world is going to be the better of female suffrage, would like to hear from the leading women of the movement on the *Alabama* question, the fisheries question, the civil service question, the minority representation question, the tariff question, the labor question, the question of education, the judiciary question, the question of international arbitration, the question of neutral rights and duties; in short, the various questions over which the male mind of this nation and of the civilized world is just now sorely perplexed. If women are on all these matters to have an equal voice with men, let us, males say, have some specimens of their qualifications; don't let us flood our polls and legislatures with excitable busy-bodies and know-nothings, delicate in health, weak in the nerves, and deficient in self-control, and utterly ignorant of the considerations by which the strong and working half of the population of the globe is swayed. We have enough of these amongst ourselves already; and the task of governing the world is already too hard to make it desirable to make any rash experiments. Now it will not do, in answer to this reasonable and modest request, for one of our women's rights ladies to get up on a platform and talk as follows: "As regards the *Alabama* question, my opinion is that England in that matter was certainly wrong. She ought never to have let the *Alabama* sail; love should have been the guide of her conduct. It may be that some excuse may be found for her in the rules of what is called international law; but international law is a barbarous relic of the dark ages. The time has come for some new mode of regulating international relations, and the mothers, and sisters, and daughters, and wives, and nieces of the land, trust me, will supply it. The fishery question, it seems to me, is easy enough to settle, if men would only behave as they ought. I know nothing about your treaties. There have been too many man-made treaties already; but the three-mile rule is certainly a bad one; half-a-mile is enough for any rule; and I confess I have yet to hear any good reason why the hardy Cape Cod fisherman should not catch a cod where he pleases, in order to supply the wants of the wife and the little ones, who pray for him nightly as he tosses in his frail bark on the dangerous deep. The civil service question and the minority representation question, much as they have puzzled the male mind, to woman's clearer perceptions present no difficulties whatever. All we have to do is to elect good men and good women to office; here is the real remedy for all defects in our civil service and our representative system. As regards the judiciary, a judge who consults his wife, and confides in the strength of her God-given intuitions, will never be led astray. Give him a pure and happy home, and a wife whose judgment he respects, not a drudge or a toy, and we shall hear no more of corruption or incompetency on the bench; nay, I will go further, and say, put his wife beside him on the bench, and then let us see if he will dare to give unjust decisions. [Tremendous applause—cries of 'that's the talk.'] Of international arbitration, I have only to say that it seems to me a good thing, though it will never be firmly established till woman gets the vote; and one needs not to be a Solon to know that neutrals, like all the rest of the world, ought to have their rights and to do their duties. The labor question owes its very existence to men's selfishness; if capitalists would obey the Golden Rule, and pay their laborers a fair day's wages for a fair day's work, there would be no labor question. Let the capitalist do this, and make no distinction in doing it between male and female labor; nay, let him, if he does make a distinction, take into consideration women's greater conscientiousness, and fidelity and purity, and all will be well."

"THE CHRISTIAN UNION" AND JUDGE CLERKE.

WE asked the *Christian Union*, a fortnight ago, to justify by citations the following passage in a late issue, in an article on "Our Judiciary:"

"The press is moreover apt to be carried away by local excitement into sweeping and unfounded censures. Thus, some years ago, during a temporary panic, Judge Clerke, who was one of the most thoroughly honest and independent judges in this city, was virulently assailed for discharging a person accused of murder, and at a later period—indeed, up to this very time—the *Nation*, which we consider as usually a model of temperate criticism, has constantly spoken of certain acts of Judge Clerke in terms which nothing but a suspicion of corruption could justify. Yet the *Nation* very rightly favored his re-election within a month after he had committed these 'outrages,' as did all the Republican papers in the city. The fact was, of course, that the editor had never investigated the matter, and denounced as an act of villany a proceeding founded upon law and justice, simply because it was attended with disagreeable results."

It has responded as follows:

"THE 'NATION' AND JUDGE CLERKE.—Two weeks ago we said that the *Nation* had 'constantly spoken of certain acts of Judge Clerke in terms which nothing but a suspicion of corruption could justify.'

"The *Nation*, professing that well-deserved respect which we know it entertains for Judge Clerke, denies that it ever 'assailed or criticised him for any official act,' and thinks that we have made a grave mistake.

"Our language was well considered, and covered the precise ground, which the *Nation's* denial does not. We spoke from recollection only, but from a recollection too vivid to be mistaken. We are able to quote chapter and verse for one proof of our assertion. In No. 227 of the *Nation* (Nov. 4, 1869), the leading article opens as follows:

"'The all but incredible prostitution of certain of our courts . . . the recent *utterly unjust and untenable injunctions* against the Stock and Gold Boards and the Gold Exchange Bank, *all* issued by the men habitually spoken of by a certain class of people as "our own judges," . . . are gradually producing the conviction in the minds of many men that . . . courts are specially provided to give the strong and the wicked an opportunity to oppress the weak and the honest.'

"When this article was written, a full half of the injunctions thus specified as *all* issued by corrupt judges, had been issued by Judge Clerke, and at least one or two of them had been issued by Judge Brady, whose reputation is equally high.

"This seems to us to justify the exact terms in which we spoke, viz., that the *Nation* had constantly spoken of *certain acts* 'of Judge Clerke in terms which nothing but a suspicion of corruption could justify.'

"Upon the merits of the fiscal management which asked for the injunctions, and upon the legal merits of the injunctions themselves, it is not necessary to enter. The simple question is, did the *Nation* 'speak of certain acts of Judge Clerke in terms which nothing but a suspicion of corruption could justify?'"

The simple question is not "Did the *Nation* speak of certain acts of Judge Clerke," etc., but did it speak of certain acts *as acts of Judge Clerke?* In other words, in speaking of them, did it know them to be acts of Judge Clerke? and did it base on them a suspicion that Judge Clerke was corrupt, and did it commit the absurdity of recommending Judge Clerke for election after conceiving this suspicion? and has it "*constantly*, up to this very time," spoken of such acts as signs of corruption on the part of that gentleman, while all the while entertaining "a well-deserved respect" for him? We are sorry, on the *Christian Union's* account, to say that to every one of these questions a negative answer must be returned. The writer in that paper, in the first place, ought not to have made such charges "from recollection only;" in the second place, his recollection was not "vivid" at all, but very defective, as is plain to be seen; in the third place, he ought to know that it is not permissible to bring against anybody a charge of constructive slander; in the fourth place, he has not got hold of the facts correctly. There were eight injunctions issued to our knowledge, when the article in question was written; of these, *six* were issued by Barnard and Cardozo, and *two* by Judge Clerke. That they were *all* unwarrantable and untenable, we thought then and think still; but the writer in the *Union* cannot have known we thought so, for we did not say it. He has assumed it; he also assumed that amongst the judges who issued unwarrantable and untenable injunctions, and who are called by a certain class "our own judges," we set down Judge Clerke. He had no right to assume anything of the kind. No mention being made of Judge Clerke's name, he was bound to give us the benefit of the doubt, and presume that we were simply guilty of making too sweeping a statement, and could not possibly have meant to include Judge Clerke amongst the judicial creatures of the Ring. He has, however, done worse than this; in order to fix upon us the charge of having had our eye on Judge Clerke especially, he says we have "constantly, and up to this very time, spoken of certain acts of Judge Clerke in terms," etc. We have done nothing of the kind. No mention of Judge Clerke's acts, as such, has been made in the *Nation* since November, 1869, nor any mention of Judge Clerke's name; nor any assertion, nor insinuation, nor inuendo that would lead any candid person to suppose that we suspected him of corruption. The injunctions were all discreditable performances. The granting of them on Judge Clerke's part was unquestionably the result of haste, as No. 2 enjoined a man who had been enjoined already. Barnard's and Cardozo's motives we need say nothing about. The writer in the *Christian Union* does not know "whether the proceeding was founded on law and justice," and ought not to have expressed any opinion about it. The injunctions were never argued, but all "settled" or withdrawn.

WHAT THE PRUSSIAN ARMY IS COMPOSED OF.

BERLIN, November 5.

IN compliance with your wish, I enter into the particulars of your correspondent "A. T.'s" queries about the Prussian military system, as propounded in No. 277, of October 20. The subject being one of general interest, I may be excused for reviewing more fully the whole ground which you very ably maintain.

The main questions and doubts of "A. T." and of the *Pall Mall Gazette* to be answered can be summed up as follows:

1. Does, according to you and other writers, the Prussian army in time of war absorb the best part of the male population; does it contain men of every profession and pursuit in about the same proportion in which they are found in civil life; or does, according to the *Pall Mall Gazette*, while admitting the superior military organization of the Prussians over the French, this organization only exist on paper, and is really only a fraction of all able-bodied men taken into service at the age of twenty?

2. Does, consequently, while war continues, society stand paralyzed; are the wheels of progress blocked; and are, on the other hand, the horrors of war mitigated and less disastrous to civilization; or is the Prussian army, like all others, principally composed of loafers, roughs, restless, shiftless, dissatisfied, unsuccessful men, who hail with delight a conjuncture like the present?

"A. T." winds up by asking the names of two statesmen, financiers, men of science, or scholars, now serving in the army, and by enquiring what the Prussians are going to do for bread to eat, clothes to wear, coal to burn, and other necessaries of life, to say nothing of luxuries, if the whole nation, exclusive of women, children, cripples, and correspondents, is going to spend the winter in France.

A short historical review will give your readers the clearest idea of the elements which compose, and of the spirit which animates, the Prussian or rather German army, as since 1866 the Prussian system has been extended all over Germany, excepting Austria.

Up to 1806, in Prussia, as in all European states, and even yet in the regular army of the United States, the mercenary system of recruiting prevailed. This system totally failed in the battle of Jena, and utterly ruined Prussia. The rusty machine did not work any longer against the French soldiers, who were still fighting with the enthusiasm of the first Revolution. If France was to be beaten, it could only be done by the whole nation; and all its energies had to be tasked, the innermost springs of its strength to be loosened, in order to succeed against the mighty conqueror. The thinking military men in Prussia—as, for instance, Gneisenau, who had served in America as an Anspach lieutenant, and there gained his experience of the power of a popular army against mercenary troops; Boyen, Clausewitz, Grolman, and, above all, immortal Scharnhorst—co-operated in effecting in their line the same reforms which Stein and Hardenberg were introducing into civil life. While Stein abolished serfdom and the monopolies of the guilds—while he opened free competition in all professions and trades, and empowered the citizens of every town to elect their own local magistrates, and unfolded every grade of intellect on the fundamental principle of Pestalozzi's method, by working the spontaneity of the mind in contradistinction to the cramming of the memory—Scharnhorst reorganized the army, by proclaiming the military service a holy duty instead of a heavy burden, and exempted no citizen, on account of birth, money, or position, from the honor of defending his country.

This spirit pervaded the Prussian armies of 1813, 1814, and 1815, and through this spirit, not through the Russian, Austrian, or English allies, the French yoke was thrown off. Scharnhorst's reforms were made a law on September 19, 1814, and to the present day form the basis of the German system. This law has since undergone some changes; from 1861 to 1866, they assumed the character of a bitter conflict between the King, Bismarck, and Roon, on one side, and the representatives of the people on the other; but the successes in the Austrian and in the present war have made the people bear the new reforms with more good-will. The only material difference between the law as it has been and as it is now is this: According to the old law, a young man of 20 was *theoretically* obliged to three years' service, but *practically* only to one and a half or two years'. After that time he belonged for two years to the reserve, then he was a landwehrman of the first and second ban for seven and five years respectively, so that his military duty expired when he became thirty-eight years old. After having left the regular army, he had to attend the exercises of the landwehr of the first ban two or three times, or spend about twelve weeks more in service, and he had then fully done his duty. The landwehr of the second ban existed only on paper, and has never been called in. But the new reform inaugurated by the present King *really* keeps each soldier three years under arms. As he has to join a regiment at the latest in his twentieth year, he is twenty-three years old when he returns to civil life. To compensate him for the extension of his actual service, he belongs only for four years to the reserve, and for the next five years to the landwehr, the second ban of which has been abolished. Thus, instead of thirty-eight years under the former law, a man is now entirely free from military duty with his thirty-second year. From his twenty-third to his thirty-second year he is called in, once for six weeks as a reservist, and twice for two weeks as a landwehrman, making in all ten weeks in nine years. These peace conditions change, of course, in time of war. Suppose a young man had just served his three years in the army and a war broke out which lasted nine years, he would be obliged to remain with the army for the whole length of the war, viz., four years as a reservist, and five years as a landwehrman.

While the conflict between the executive and legislative powers was raging on this all absorbing topic, the question was ventilated as to the length of time in which a good soldier could be drilled. The King, of course, believed that the entire life of a man was not sufficient, and if he could have had his way he would have kept the whole able-bodied male population in service for their life, leaving all civil and social duties to children, cripples, and women. The radical opposition, like the *Pall Mall Gazette*, thought six months long enough, and with particular predilection quoted the Swiss militia model. There were a great many shades of opposition between these two extremes. Able officers of the general staff of the army, with whom I have often conversed on the subject, agree that a cavalryman or artilleryman requires three years' training for himself and the horses he has to attend to, while an infantryman can be fully drilled in the course of one year, and in two years will be an excellent soldier. The opposition, as a compromise, asked two years for all arms, but the King, ably assisted by Bismarck and Roon, carried his point; and thus three years is now the lawful term of service for every German soldier. Only young men—students, artists, merchants, etc.—who have attained a better education, form an exception to the rule. They can enter as volunteers when they are 17 years old, and serve only one year, but have to support themselves.

How does this system work? The present population of North Germany amounts to about 30,000,000 of inhabitants. Of this population, one per cent., or 300,000 men, form the regular army. As they serve three years, 100,000 are yearly liable to be levied, and as each man belongs to the army for twelve years, in time of war it can be 1,200,000 strong. At present we have about 1,000,000 of soldiers in the field; the oldest landwehrmen have partly been sent home, about 100,000 are sick or killed, and still others garrison the fortresses. Thus one per cent. of the population does not, of course, represent the whole male population which becomes liable every year, for its number really amounts to from 320,000 to 380,000. But of this number about two thirds are free from service for different reasons, or, in other words, out of three or four men, only *one* can actually be called in. Among those who are exempt are, above all, cripples, invalids, young men not fully developed or too small—the German standard of measurement is five feet, about five feet one inch or five feet one and a half inches English, while the French measurement is only four feet ten inches; criminals sentenced to state prison; then ministers of the Gospel and teachers, who are obliged to serve only six weeks; the only sons of widows or of aged parents who cannot support themselves; emigrants or people free under state treaties; and, finally, volunteers who serve only one year, on account of their higher standard of education, and are not included in the regular numbers. Taking the sum of recruits at an average of 360,000 per year, and deducting the above two-thirds, there remain 120,000, 20,000 of whom, or sixteen and two-thirds per cent., are not taken, and become exempt by drawing lots. Thus, of a town which has to furnish say 100 recruits per year, those sixteen or seventeen who draw the highest number are not called in. Part of the above are only temporarily exempt, and are placed in the reserve, from which they are called in case of need. In times of peace, the army loses every year an average of 8,000 men by death, accident, or sickness, whose places are filled by those reservists. The agricultural population of North Germany amounts to 72 per cent. of the whole, but in the army it is represented by 80 per cent., as the farmers are generally healthier and more robust. From manufacturing districts, the percentage is smaller, as people working in factories are physically weaker and less developed; but here the difference is partly made up by the wealthier classes, who consider it an honor to serve, and are ambitious of being promoted to officerships in the landwehr. On the whole, it can be said that about 90 per cent. of all able-bodied men are really taken into the service of the army at the age of 20 or sooner, while about ten per cent. are free. You are, therefore, in my opinion, perfectly justified in stating that our army, in time of war, absorbs the best part of the male population, and that it contains men of all professions and pursuits in about the same proportion in which they are found in civil life.

In popular wars, however, like the present, and those of 1813 to 1815, their proportion is much larger than the law prescribes. Ask our venerable friend, Dr. Francis Lieber, how old he was when, as a volunteer in the glorious old Colberg Regiment, he was wounded at Waterloo. It is the same case now. Young students, merchants, artists, noblemen, etc., who are older than seventeen years, do not want to stay at home. They are all eager to fight, and consider each day lost in which they do not face the enemy. The whole of that class of volunteers in the German armies is between 15,000 and 18,000. Of my nephews, for instance, four are in the field. One is a soldier by profession, and, of course, does not belong to this class; another is a farmer and lieutenant in the landwehr, and has been called in; but the two youngsters, one being not quite 19, and the other between 17 and 18, could not be prevented by their mother from joining the army. This is about the proportion in every good family.

Here are a few examples which I can guarantee, as they are within my personal knowledge. From the Berlin University, which has about 2,000 students, 800 have left as volunteers for the field; from the other Berlin high-schools, such as the Polytechnic and Architects' Academy and Academy of Fine Arts, 700 more; thus 1,500 in all. The newly-formed battalions of the Fusiliers of the Guards, 1,000 men strong, which the Berlin people nickname the Maybugs, is exclusively composed of Berlin students. As scholars more widely known, I mention Drs. Hassel (historian), Giercke (jurist), Rothe, and Brakelmann, private lecturers of the Berlin University, the two last of whom have been killed in battle. Brakelmann was studying the archives of Naples for the *Monumenta Germanica*, containing the mediæval sources of German history, when he learned the declaration of war. He hastened home, and, entering the army as a sergeant, sacrificed a glorious future as a scholar to the good cause of his country. Dr. Pabst, another young historian of great promise, was killed in one of the first battles. Of the Breslau University, the whole medical faculty is in the field; all professors and students have joined the army as surgeons, nurses, soldiers, or volunteers. Two students of Königsberg, Hirsch and Müller, have been decorated with the Iron Cross; a young professor and astronomer, Dr. Tischler, a lieutenant, has been killed in battle.

The other day I introduced my boy to the director of the Frederic William's Gymnasium. On this occasion Dr. Ranke handed me the last year's report of that school. I found in its chronicle, on pages 21 and 23, that in 1814 and 1815 not less than 85 of its pupils entered Paris as victorious Prussian soldiers; that in the present war one of the professors, Dr. Hackstroh, twenty-six years old, was a sergeant in the 46th Infantry Regiment, and fell at Wörth; that another, Dr. E. Richter, an assistant teacher, fell at Metz on August 18; and that of the volunteers who left the Gymnasium at the outbreak of the war, none of them being older than 19 years, 13 were killed, and 8 severely wounded. One of the young men, Max Fleck, was the son of the attorney-general of the army; another, Günther, Count Itzenplitz, son of the present Minister of Commerce; and Count A. von Beust and Count von Schwerin, sons of former ministers of state. Their names will be engraved in gold on a marble tablet in the great hall of the Gymnasium.

On October 20, I saw Shakespeare's "Much Ado about Nothing" at the Royal Theatre. That day's programme, at its foot, states that of the members of this institution the following employees have been called into service, viz.: 3 musicians, 6 singers, 9 dancers, 20 machinists, 4 lamplighters, and 6 floor-keepers—48 in all. The Royal Opera has about the same number of its employees in the field.

I cannot give you the name of any prominent statesman or financier, as this class of public men are usually older than our soldiers when they attract public attention; but I know many young diplomatists—Mr. von Krauss, for instance, who, some years ago, was the able secretary of the German Legation at Washington—assistant judges, sons of bankers and merchants, who volunteered at the outbreak of the war, and have partly been wounded or killed on different battle fields. A prominent Cologne banker, Mr. Deichmann, has two sons in the field, one of whom belongs to the firm; the son and junior partner of a Berlin banker, by the name of Königsberger, was pierced by a ball and killed in storming the Spicheren heights. A great Berlin publisher of agricultural books, Mr. Parcy, owner of the firm of Wigand & Hempel, is a lieutenant of the landwehr now near Paris. More than thirty Prussian judges, who served as privates, sergeants, and lieutenants in the army, have thus far been killed in battle. All these items are so much everyday occurrences that, if there be no personal interest at stake, the individual cases are not even noticed. If I had only a few days' time, I would collect as many hundred illustrations, of all callings in life, and especially in the so-called higher classes, as I have now singly enumerated. But these statements may suffice in answer to the first query; as to the second, I can be more brief, and I will answer its latter part first.

We have not a single loafer in the army, for the sole reason that there are none outside of it. There are criminals in the state prisons, but scoundrels who defy the law, and, as in New York, through political influence, fill even public offices, as police justices, policemen, etc., are an utter impossibility with us. Our country is too poor for indulging in the luxury of loafers. Here a man must work or perish or become a criminal. Besides, we have no political parties which secure them impunity or pardon, and, consequently, no high civil functionaries who call the most brutal cut-throats their good friends. You can afford to entertain nearly an army of that class of the most reckless idlers; here it is just the army which kills loaferism in the bud. The same low and uneducated classes which with you create this cancer of the social body, in this country furnish an excellent stock of efficient sergeants, gendarmes, and lower clerks. These officers are chiefly recruited from those poor but ambitious individuals who, having served at least three years in the army, "capitulate," as the term is, *i. e.*, agree to serve nine years longer, and, as a reward of this twelve years' service, are promoted to one of these small offices. On the other hand, a man upon whom a criminal sentence has been passed is not considered worthy of being a soldier, and consequently is excluded from service.

To conclude with the first part of the second query: society does stand paralyzed just in proportion to the number of men who in time of war are under arms; but the horrors of war, instead of being mitigated, are spread all over the country, and felt in every house, in every family. Deduct one million of men between twenty and thirty-two years—in the present war we have thousands who are older, as they are still liable to service under the old law—from a population of thirty millions, and you will arrive at a conclusion yourself. In the country the loss is less felt than in the cities. There the work of men is partly done by women—invalids assist, at least, in the performance of the daily duties—and in this war we have more than 300,000 prisoners, who can be compelled to work. In the cities the loss is much harder to bear. From Berlin alone 35,000 young men are in the field, *i. e.*, five per cent. of the whole population of the capital. Some branches are obliged to work with only one-half, others with one-third power, others are shrinking or entirely given up during the war. All trades of luxury are at present at a perfect standstill; booksellers gain little or nothing. All cases pending in the courts against soldiers are suspended, new suits cannot be brought against them, and of the Kammergericht (Court of Appeals), for instance, only five instead of six general and special terms hear and decide cases. The same proportion takes place in other courts. However burdensome this military system may be in some respects, it is at all events the only one which deserves the honor of being called democratic, and the nation which is raised under and by it will always prefer peace to war, and never be dominated by a conquering spirit. For the very reason that it is interwoven with the nation's greatest and smallest interests, the German army will never be more or less than the people in arms, and ask nothing better than to be sent home at the earliest practicable moment, in order to pursue nobler and more productive callings than marching and killing.

FRIEDRICH KAPP.

Correspondence.

"DOES PROTECTION PROTECT?"

TO THE EDITOR OF THE NATION:

SIR: In your notice of the very admirable work of Mr. W. Grosvenor, "Does Protection Protect?" you say "that the basis of all national prosperity is to be found in the *profits* earned by the producers of the necessaries of life." I cannot fully agree to the form in which you have made this statement, as there are many supposable cases in which prosperity may exist even without great profit, in the sense in which you use that word. For instance, an isolated community, large or small, may enjoy a great abundance of every necessary of life, and yet because of the existence of obstacles to the exchange of their surplus, they may see their surplus product perish on their hands; hence, they may have little or no profit, and but small and slow accumulation of capital. Vermont contained many such communities before the day of railroads. Your reference to profits, however, in connection with the question of protection, leads to a very important view of the matter, which I have never seen presented.

I long since asked myself the question, Why is it that the imposition of duties, and the consequent increase of the cost of imported articles, should cause such persistent controversy, and have so great an effect, when it is the fact that the total import of any nation is very insignificant in amount if compared with the annual domestic product of that nation?

Let us take our own case. The value of the annual product of the United States has been estimated by Mr. Wells at about $7,000,000,000, and no reasonable objection can be taken to his estimate as a minimum. Our imports, on the other hand, amount to only $400,000,000 in gold value or $500,000,000 in currency, bearing the relation of only seven per cent. to the annual product. Upon this import a duty is assessed of about $180,000,000 in gold, or $205,000,000 in currency. It would therefore seem that the duty collected is equal to about three per cent. upon the gross product—a heavy tax, but not one to provoke such controversy, if its importance were truly represented by that relation. Its effect, however, is to be estimated by a very different rule. So far as these duties are collected from articles which enter into the processes of our labor, whether as farmers, mechanics, or manufacturers, they enter into the cost of our product; and their effect is to be gauged by their relation to the profit expected from the occupation, and not by their relation to the gross cost of the product.

This can be best understood from one or two examples. Assuming that the amount of duty received by the Government is all that is paid by the consumer, although a considerable addition should be made for cost of collection, interest, and profits, the following would be fair examples:

In a pair of stout boots, worth $3, the cost of leather constitutes more than one-half the whole cost, say $1 50. We cannot produce as many domestic hides as we need, and, therefore, the price of all hides is raised to the extent of the duty imposed on those imported. The proportion which the cost of the raw hide bears to the leather is fully one-half. One quarter part of the cost of the boots is, therefore, the cost of hides, and the cost of hides is increased ten per cent. by the duty imposed at that rate, say, seven-and-a-half cents, or two-and-a-half per cent. on the value of the boots. Apparently a small matter.

But the value of the annual product of a boot factory is not less than four times the capital required to establish the business, and if the tax or duty on the product is two-and-a-half per cent., then it is equal to a tax on the capital of ten per cent. We used to export boots in large quantity to the British Provinces, but as they now have hides free, and therefore have an advantage over us of ten per cent. profit on the capital required to make boots, of course our export has ceased. As Mr. Grosvenor so effectively proves, a high tariff prohibits exports.

Let us take a larger example: We collect annually a little more than $6,000,000 on about $15,000,000 worth of drugs, dye-stuffs, chemicals, varnishes, glue, and the like, averaging forty per cent. duty. These articles form an element of the cost of leather, soap, acids, alkalis, furniture, and many other manufactures; yet they themselves cannot be called *raw* material, as they are to a large extent the product of skilled labor and are the result of difficult and costly processes. In general, this class of articles enters into certain manufactures as part of their cost, of which the annual product is very large in proportion to the capital needed to establish them, and therefore the duty upon them is excessive in its relation to the profit on capital. Take furniture, formerly a large article of export. The annual product of a furniture factory is probably five times the capital, and if the heavy duty on varnishes and glue only increases the cost of furniture three per cent., it may be equal to fifteen per cent. on capital—hence we have ceased to export furniture; labor is restricted, and diversity of employment prevented.

But the most striking example is to be found in the *use* of steel, in the production of which about 3,500 protected workmen are now employed. We are said to excel England in the application of machinery to the making of cutlery, agricultural implements, tools, etc., of which steel is the component material of chief value. I know not what is the relation of capital to annual product in these trades, but I will assume that a plant or capital of $20,000 will be sufficient to turn out only $40,000 worth of steel tools, in the cost of which $15,000 would be the cost of steel and the rest wages. Ten per cent., or $2,000 a year, profit would induce the establishment of such a machine-shop, if the $15,000 worth of steel could be had on the same terms on which the cutler or machinist of Sheffield or Birmingham has his supply; but our Government imposes a duty of sixty per cent., or $9,000, on the steel, equal to four-and-a-half times the exported profit, or over twenty-two per cent. on the capital. Yet, in spite of this, our export of tools has not yet entirely ceased; but what might it not be if exports were not impeded by the tariff; and how soon would that little force of 3,500 protected steel-makers be absorbed in the great army of steel users if the consumption of steel were not obstructed?

A leading member of the English Parliament lately said to me, "We do not fear you as manufacturers, so long as you maintain a high tariff, but when you adopt free-trade you will drive us from many of the markets of the world, for we cannot then compete with you."

It might be impertinent for me to ask if it is not possible that the *Tribune* is subsidized with British gold to maintain a high tariff, and thus obstruct our exports and destroy our commerce.

E. A.

BOSTON, Nov. 18, 1870.

[We suppose there can be little doubt that the *Tribune is* largely subsidized by somebody, most probably by the British. We *know* Wells is, for the *Tribune* has repeatedly said so, and after a careful examination of the symptoms in his case, we are driven to the conclusion that Mr. Greeley gets twice Mr. Wells's pay. There is no other way of accounting for the heat he shows in this controversy, for he is not himself a manufacturer. The British are very cunning in their management of these things. They never pay all their gold to one side. They always, when they bribe one man to attack a thing, bribe another to defend it, and then regulate the combat to suit themselves.—ED. NATION.]

THE FIRST "ALUMNUS" AND MR. PICKERING.

TO THE EDITOR OF THE NATION:

SIR: "Timothy Pickering, of Squashville," in the last *New Englander*, attempts to cast ridicule upon all who call for a reform at Yale College, and in his effort greatly misrepresents myself. The length and ability of the article, combined with its home-thrusts, especially the reference to "Bowen's *Independent*," easily identify the writer as a polemical, clerical member of the Corporation and a former editor of the *Independent*. The *Evening Post* has pointed out his want of fairness in mixing up chips of Mr. Phelps with fragments of the *Nation's* articles, and making both responsible for his own hash. I wish to show how great a mistake he made when he held the first "Alumnus" responsible for the opinions of the second "Alumnus" concerning ministers.

An impartial reader of my article will see that there is not a single word in it inconsistent with that high regard which I expressed for Congregational ministers, some weeks later, in the *Independent*. Indeed, I requested the editor of the *Nation* to announce that I was not the writer of the article of September 1, on the very ground that I was not willing to be responsible for its opinions concerning ministers, and that such opinions had little to do with the point under discussion. And is not this position consistent with my demand that the "government of Yale College shall not rest exclusively with Congregational ministers of the State of Connecticut"? Let Dr. Pickering prove this.

He says: "The first-rate men in *any* profession are few." Very well; that concedes all that Mr. Phelps or myself demands. Yale College *ought* to be governed by *first-rate men*. There are few first-rate men in the ministry, Dr. Pickering tells us. Of course, the number of first-rate men in the Congregational ministry (one of the best, I think) must be proportionately smaller, and yet again proportionately smaller among the Congregational ministers of the State of Connecticut. Now, if "first-rate men" are so scarce, why, instead of selecting them from the professions in the United States, with the able Dr. Pickering to represent the ministry, should they be taken from a single profession, from a single denomination of that profession, in a single small State?

I suppose the reason is that Yale College would grow "as sensational" as Barnum's Museum or Bowen's *Independent* (since the change of editors), if we substituted for the Pickerings of Squashville such men as William M. Evarts, Judge Taft, Mr. Sheffield, or Mr. Phelps. But the clergymen will not abdicate. Why? Because he would have us believe the "charter" is in the way. Who doubts that the change can be effected if Squashville is willing?

I believe Dr. Pickering once had a little discussion with the "Nassau Street Tract Society." He was then on the side of reform. But he was told by Daniel Lord that "The constitution, the founders, evangelical Christians, vital godliness," etc., were in the way of their publishing anything against slavery; yet they did so publish when it paid. He has now stolen his former enemy's thunder. His argument is Daniel Lord's with "Yale College" substituted for the Tract Society. President Woolsey proposed a change in the charter and a substitution of six Alumni for the six Senators. Is he also a "fool"? The committee of 1869 favor the same change, and it is well understood that some of them agreed substantially with Mr. Phelps. Were they also "fools"? Moreover, we have reason to believe that a considerable portion of the Faculty, not under the control of the Corporation, would welcome the change. Are they also "fools," as he designates his opponents? Yet, notwithstanding these things, Rev. Mr. Pickering tells us we are "fools" for not allowing the "venerable institution to remain where the founders placed it." Did all wisdom die with the founders? In his view, the "charter" of Yale College is more sacred than the Constitution of the United States, for he favored a change of that.

All he has said about Yale College existing to make Orthodox ministers is the merest rhetoric. As a fact, it does not do that work, except in its theological school. If it did, it would descend from its high national, œcumenical position to be the tool of a single sect. By a parity of reasoning, you could prove that Oxford University ought now to be serving the Catholic Church. Cannot the present Corporation see why Mr. Sheffield, Mr. Peabody, Mr. Street, and Mr. Phelps placed their donations beyond its control? that others withhold funds for the same reason? that either there will be no central, harmonious power to govern the University if this state of things continues, or that the Scientific School must be made to overshadow the Academic Department?

But they declare "they will not abdicate." Well, then, I fear even many Yale men will reluctantly withhold their sons and their funds from the College they so truly love. But we hope for better things.

THE FIRST "ALUMNUS."

MRS. JOSEPHINE BUTLER.

TO THE EDITOR OF THE NATION:

SIR: I find that your English correspondent, in the last of his letters which I have read, repeats the contemptuous terms of "shrieking and hysterical declamation" in reference to the efforts which some of the best and most eminent of his countrywomen are making for the repeal of the Contagious Diseases Acts. It is possible he may not think it worth his while to mention one very remarkable result of these efforts which has just come to pass, and which is likely to have important influence on the fate of these odious enactments. In its last issue, the *Spectator* informs us that "Sir Henry Storks has sustained a severe defeat in Colchester [for which town he was candidate in the Liberal or popular interest for a seat in Parliament], having recorded nearly 600 votes less than his opponent, Mr. Learmouth [the Tory or aristocratic candidate]. The defeat is claimed by the Conservatives, but not quite fairly. In this instance, the Liberal candidate *was defeated by Mrs. Josephine Butler.* Sir Henry Storks is a warm advocate of the Contagious Diseases Acts, and a letter was produced from him in which he said that the Government must recognize prostitution as a necessity. He probably meant as an inevitability, like sin, or death, or hail; but the sentence ruined him in Colchester, a garrison town, where the act has been put in force. That act will either have to be given up, or discussed in Parliament with open doors."

Now, Sir Henry Storks is no ordinary man. As a military officer and civil administrator he has a high reputation; he did the state good service in Jamaica, or in the Ionian Islands (I am not sure which), as governor; and would most likely have been successful in Colchester, where he had all the Government interest, but for his unlucky dictum, and for the presence and active opposition of Mrs. Butler, who entered on the electioneering campaign in Colchester for the express purpose of preventing his return.

Again, this shrieker and hysterical declaimer, Mrs. Josephine Butler, is no ordinary woman. She is, in every sense, a lady, of noble presence, distinguished manners, and excellent social position. She is a daughter and biographer of John Grey, of Dilston—a Northumbrian gentleman, whose efforts were mainly instrumental in raising his native county to high rank in improved agriculture and social civilization. The Rev. Mr. Butler (Mrs. B.'s husband), an Episcopal clergyman and master of the Liverpool College or High School, is one of a family remarkable for the numbers of eminent educators it has produced, and, I may add, he is in full sympathy with his wife in the self-denying efforts she is making to rid the British statute-book of one of its most objectionable and demoralizing enactments.

RICHARD D. WEBB.

DUBLIN, Nov. 8, 1870.

THE CARBON PROCESSES.

TO THE EDITOR OF THE NATION:

SIR: In the notice of the carbon prints in the last *Nation*, there occurs an error, which I beg leave to correct. The process of Braun, of Dornach, is the original autotype process of Swan, the greater brilliancy of the interlineal spaces being due to the superior quality of the negative.

There are three so-called carbon processes, all depending on the quality which the chromates have of rendering gelatine in combination with them insoluble when exposed to light. The autotype process makes the prints by the direct action of sunlight on a chromated gelatine tissue impregnated with coloring matter. The sunlight, penetrating the negative, impresses those portions which represents the shadows, and the print thrown into tepid water permits the lights, which were protected by the dense parts of the negative, to be washed away. The results of this process are in all respects equal to the silver prints, and are indestructible.

The Woodbury-type, or photo-relief, is a mechanical process, in which the gelatine film is, after the action of the light, allowed to lie in cold water, which makes the film swell in those portions corresponding to the lights, producing an intaglio, from which a mould is made, which, being filled evenly with a gelatine ink, is transferred by a press to a paper, on which it dries, preserving all its lines and shades.

In the Albert-type, the block (of ground glass) is coated with a similar film as in the other processes, which, being wetted, swells and gives a printing surface, from which, as from a lithographic stone, many copies can be printed.

I omit, for brevity's sake, details not necessary to the understanding of the principles involved. In the two former processes, the color of the print is some coloring matter mixed with the gelatine; in the last, printer's ink.

Yours truly, W. J. STILLMAN.

PLAINFIELD, N. J., Nov. 16, 1870.

Notes.

LITERARY.

THE most noticeable original work in Messrs. Appleton's list for November is Dr. Hammond's "Physics and Physiology of Spiritualism." The same house announces "What to Read, and How to Read," by Dr. Charles H. Moore, formerly a professor in two of our Southern colleges. It consists of "classified lists of choice reading, with appropriate hints and remarks, adapted to the general reader, to subscribers to libraries, and to persons intending to form collections of books," and is "brought down to September, 1870." We do not know the compiler's qualifications for his task, but his design is a good one and worthy of the best execution.——We regret to see it announced that the *Riverside Magazine* is not to outlive the year, but, in so far as it partakes of the nature of a family magazine, is to give the benefit of its discontinuance to *Scribner's Monthly*. In form, mechanical excellence, and in its editing, it has seemed to us unsurpassed as a magazine for children; and although we are not convinced that such periodicals are as great an advantage to the young as they are a convenience to parents, while we have them, by all means let us have them at their best. *Our Young Folks* and the *Little Corporal* remain to be taken, one for one reason, and the other for another; and, as American productions, have doubtless something to recommend them above their foreign rivals. Neither of them, however, is in our opinion superior, or equal in pictures or print, to *Good Words for the Young*, conducted by George MacDonald, of which Messrs. J. B. Lippincott & Co. are the agents in this country.——Messrs. Hurd & Houghton announce volumes two and three, completing Prof. G. W. Greene's "Life of Nathaniel Greene," a substantial contribution to our Revolutionary history.——Messrs. Dodd & Mead will issue "Marcella of Rome," by Frances Eastwood, a story that has already appeared in *Hours at Home*; also, a new story, of which the title is not yet divulged, by the fertile author of the "Schönberg-Cotta Family."——Messrs. W. C. Little & Co., Albany, will publish for Mr. Audley W. Gazzam—whose "Treatise on Bankruptcy" is shortly to go into a second edition—another work, "Bankruptcy Digest and Rules of Practice," which will doubtless also prove serviceable to the profession.——One of the consequences of the cessation of *Putnam's Magazine* was the cutting short of Mrs. Mary Clemmer Ames's serial story, "Eirene"—owing to her inability to finish it in season—but the whole may shortly be expected in book-form. Messrs. Putnam & Sons announce also a "Popular Standard Speaker and Guide to Oratory."

—It cannot be long before communication by cable-telegraph will make the affairs of Brazil of daily interest to us, and quicken the interchange of merchandise and ideas between the two countries, which already is not slight. In developing the fringe of that wilderness of an empire, American skill, it is well known, has been freely employed, and with the most gratifying results, while American manufactures find there an ever-increasing sale in spite of European competition. The Emperor's partiality for our language and literature has been frequently attested, and our savants who have visited his provinces in the interest of science have been treated by him with the most enlightened hospitality. It may readily be supposed that his subjects will improve any reasonable opportunity to extend their acquaintance with the people of the United States; and as the best way to do this is to study our mother-speech, they will be glad of the English Reader just prepared for them by Mr. J. C. Rodrigues, editor of *O Novo Mondo*, of which we spoke lately. Messrs. A. S. Barnes & Co. are the publishers of "Chrestomathia de Lingua Ingleza," a book of some 400 pages duodecimo. The compiler prefixes a general view of the origin of language, then treats of the Indo-European group, and of the derivation from it, composition, and development of the English language, in the usual manner, with a brief survey of each period to the present time. This introduction is followed by extracts in prose and verse, generally copied from similar compendiums, and prefaced in each case by a short account of the writer. The defects observable in this part of the editing—and they are not many nor serious—indicate original labor on the part of Mr. Rodrigues, and it is creditable to him that, in aiming apparently to select such pieces as would tend to elevate his countrymen, he has given rather more than their share of space to the writers of the present century. In regard to the literature of the United States, he is of opinion that it is far less original, as compared with that of England, than that of Brazil is as compared with the Portuguese.

—Since we were so indiscreet, in noticing the magazines for November, as to allude to the charges brought against Mr. Seward by Ex-Secretary Welles, it is but fair to say that General M. C. Meigs has taken some exceptions, in a Washington paper, to the correctness of the *Galaxy* article, which no one can fairly pronounce upon the quarrel without considering. He says that Mr. Welles attributes to him a statement which he used in a former rectification of the history of Fort Sumter merely to controvert it, and that this made a very important and indeed essential link in Mr. Welles's chain of evidence. We cannot here go over the whole story, but the point is as to whether the *Powhatan* was detached from the Sumter expedition by influence brought to bear, either patriotically or not, upon President Lincoln. General Meigs alleges that this vessel was assigned, at his instance, to the relief of Fort Pickens two days after the Sumter fleet was made up without her, he being ignorant of the latter expedition and Secretary Welles being kept ignorant of the former. Of course, when the Secretary wished to add the *Powhatan* to his fleet, she was engaged, and he was naturally chagrined. However, General Meigs says she could not have rendered the least service at Sumter, as events proved.

—Mr. Disraeli has improved the occasion of a new edition of his collected works to write a preface in which he reviews them all, explaining the motives with which each one of them was written, and so saving some trouble to his future biographer. He consoles himself as against his critics, whom he speaks of with his usual contempt, with the fact that "Lothair" has received a vast deal of attention from the American press, and that even in England "the aggregate of articles" which it has evoked "is in amount perhaps unprecedented." And he is obliging enough to say that the American notices appear to him "generally to be sincere," and that he thinks they need not fear competition with the similar productions of his own country "in point of literary ability, taste, style, and critical acumen." Another satisfaction he derives from retrospect is that "Goethe and Beckford were impelled to communicate their unsolicited opinions of 'Contarini Fleming' to its anonymous author," and that Heine wrote a criticism on it "of which any author may be justly proud." And we cannot suppose him to be wholly unflattered by the popularity of "Vivian Grey," which he calls an essentially puerile work, but which "has baffled even the efforts of its creator to suppress it," so that "forty-four years after its publication he must ask the indulgence of the reader for its continued and inevitable reappearance." Other parts of this preface are a sort of political testament of the author, and do not need to be dwelt upon here.

—Announcements of English publications for the season are not yet over. The titles that follow probably represent by this time works already issued, if they have not indeed reached this country: "The Prophetic Spirit in its Relation to Wisdom and Madness," by Rev. A. Clissold, might perhaps be profitably read in connection with Dr. Hammond's forthcoming work on Spiritualism; "The Companions of St. Paul" is by J. S. Howson, D.D., Dean of Chester, who also treats in a companion volume of "The Character of St. Paul;" "The Miracles of Our Lord," by George MacDonald, "Half-Hours in the Temple Church," by the Master of the Temple, Rev. C. J. Vaughan, and "Essays, Theological and Literary," by Mr. R. H. Hutton, are also works in which clergymen will be interested. These occupy a middle ground between history (including biography) and theology, viz.: "Walks in Rome," by Augustus J. C. Hare; "The History and Literature of the Israelites, according to the Old Testament and the Apocrypha," by C. and A. D. de Rothschild, in two volumes, of which the first treats of the historical books, the second of the prophetic and poetical; a third edition of Mr. J. F. Maguire's "Rome and its Ruler,' which has been "brought down to the latest moment," and appropriately re-entitled "The Pontificate of Pius the Ninth;" "The Life and Letters of Hugh Miller," by Peter Bayne; "Memorials of R. D. Hampden, sometime Bishop of Hereford," edited by his daughter, Henrietta Hampden; and possibly these two will be mentioned in place: "Iona," by the Duke of Argyll, and Mr. J. C. Jeaffreson's "Annals of Oxford." Contributions to science are: "The Natural History of the Azores," by F. Du Cane Godman, and "The Ornithology of Shakespeare," by J. E. Harting, who is not to be behind those who have explored the grammar, religion, law, and other knowledge of the dramatist. "A Book of Almanacks for any Day preceding A.D. 2000," by Prof. De Morgan, is evidently good for the use of the youngest inhabitant of this planet, and the correctness of any part of it is not likely to be called in question by any one who trusts in it. Those given to looking backward rather than to forecasting may prefer the novel "In Memoriam Album" (London: Simpkin & Co.). Memorial cards, for the preservation of which this album has been devised, are scarcely known in this country, except as received from friends abroad; and it is left to some publisher here to prepare a record in which deaths may be entered, whatever the source of information concerning them. Such a list, kept during an average lifetime, would be useful also afterwards if deposited in a public library.

—"America," in the rubrics of Continental newspapers, as often as not refers to South America, but in the following titles it signifies the United States: "Sketches from America," by John White, who divides his book into three parts—(1) Canada, (2) Apie to the Rocky Mountains, (3) The Irish in America; and "Eleven Years' Experience in the Western States of America," by W. M. Stewart, who adds to his narrative an analysis of prairie soil. Other books of travel are: "The Land of the Sun," by Lieut. C. R. Low, who gives memoranda, historical and geographical, of places of interest in the East which he visited during many years' service in Indian waters; and "Peeps at the Far East," or a familiar account of India, by Norman Macleod, D.D. Moxon's edition of "Wordsworth's Complete Works," with a critical memoir by Mr. W. M. Rossetti, is out; and we are to have "Ballads of Life," by Robert Buchanan; "Rehearsals, a Book of Verses," by John Leicester Warren; "Poems of Bygone Years," edited by Elizabeth M. Sewell; and "The Songstresses of Scotland," in two volumes, by Misses Tytler and Watson. Miss Tytler also offers a second series of her "Papers for Thoughtful Girls;" and thoughtful children, without regard to sex, will be edified by "Chamber Dramas for Children," by Mrs. George MacDonald; "At the Back of the North Wind," and "Ralph Bannerman's Boyhood," by her husband; and "The Boy in Grey," by Henry Kingsley, assisted by the pencil of Mr. Arthur Hughes.

—The English quarterlies have not yet given up entirely a certain practice of theirs, which now for many years has made them ridiculous in the eyes of the American reader, and, moreover, has kept the American reader in a state of extreme exasperation. The editor would appear to think that, in the case of European, Asiatic, African, and Australasian topics, he must get hold of writers to treat of them who thoroughly understand their subject, or, at least, he must try and get hold of writers who have a good deal of knowledge of their subject. If, then, for example, affairs of Bokhara are of current interest at a given moment, the editor of the *Edinburgh* or the *Westminster* bestirs himself to get hold of some traveller or diplomatic agent or army officer who really has seen, and seriously considered, the Russian advance through Central Asia towards India. If the Kabyles call for discussion, the editor seeks for some man who knows Algiers, either from observation or from much reading, or from both. Mr. Gladstone, if possible, is to be had in to write about Continental politics when Continental politics are of interest to the British public. Mr. Lowe or Mr. Childers the editor might, it is probable, supplicate for a paper on colonial questions should the former home of these ministers furnish subject-matter for a couple of editorial articles in the *Times*. Medes, Ethiopians, Jews, the sledded Polack, Fenians and Esquimaux, Mesopotamians and dwellers in the isles of the sea—all secure from the Quarterly editor the best ability that he has at command. But if there is about the office a young lion, whose teeth are not as yet grown, and who yet, for a season, must mumble the prey till he be of such strength as to rend it—if there is on the list of contributors a Scotchman learning to write English, and capable of endless quantities of padding, which shall at least have the true dogmatic Quarterly ring—or if there is a promising young man at the University who knows some things, and knows, further, that he is omniscient, and likes to be slashing in a review—such a scholar and critic is the person whom the Quarterly editor sets at work to review "American literature," or to explain, in 1870, that the true character of the American polity may be best perceived in the greedy violence with which that people has wrested from "a sister republic" the province of Texas; or to point out that in the city of New York republicanism has been carried to its logical outcome—with what result is known to Messrs. Overend, Gurney, McHenry, Sir Morton Peto, and other victims of the rascality of Fisk, Gould, Tweed, and other acknowledged Democratic leaders. The *North British Review*, for example, published a while ago—some three years since, perhaps—an article on American literature which probably is to-day an article *de fide* with some thousands of Englishmen and Scotchmen. Its author was Mr. Gerald Massey, a student of literature who has the same claim to attention as a literary authority which Captain Isaiah Rynders would have in a school of oratory—both gentlemen having in common the power of misusing articulate speech, to the present pleasure and lasting injury of themselves and numbers of other people. Few American authors had places in "Chambers's Cyclopædia of English Literature;" but "Maria del Occidente" and Mrs. Lydia Sigourney had produced some verses which Mrs. Hemans might have been not ashamed to own; Edgar Allan Poe, a man of irregular life, had written some weird poems; and the celebrated American sense of humor had exhibited itself in calling the bed-bug "the essence pedlar"—that, we believe, was the substance of Mr. Massey's account of us; for his remarks about Washington Irving and the novels of Mr. Cooper were not distinctively his own, nor very fresh.

—The current *Westminster* has a similar essay, telling us of Charles Brockden Brown, for instance, and the "eloquent but diffusive" William Wirt And we "have no national literature," yet we have various tribes of the "red or copper-colored race," as the geographers say; and why, under those circumstances, we are not fitted out with a literature truly American there are no reasons, the writer seems to think, except that we are all engaged in the eager pursuit of wealth, and—this being the more civil and tender reason—that we are at present necessarily engaged in "subduing the continent," which our English ancestors won for us from the French. Jonathan Edwards, indeed, we have produced—a metaphysician admitted to be worthy of praise, even among European metaphysicians. Emerson, however, sits under the tree that Fichte planted, and means little. Longfellow also is Teutonic, though in another way than Emerson. Still Longfellow's "Psalm of Life" is great; and his "Hiawatha," if only we had followed its lead, would have led us to a true nationalism in literature. Nathaniel Hawthorne has few Americanisms, and writes so as to offend no English taste. In essay writing we do very well—as well as anybody; but a long poem we cannot produce; and, indeed, we are so well persuaded that we cannot produce a great poem that we have been at pains to frame a theory in relation to the matter, and declare that a poem is of necessity short, and that all long poems are, in fact, several short poems connected together by strips of prose—"Homer sometimes nods," in fact, is what we maintain. Thus our author goes on talking seriously of books and writers of whom, in the Pre-Adamite times, and the days of the *Democratic Review* and the *Analectic*, we also, who live here in America, used to talk seriously; talking condescendingly of writers whom no one who has the right to employ condescension would think of patronizing; and altogether making a jumble of old nonsense and new nonsense, and trite truth and trite foolishness, which might discourage a millenarian optimist. How the United Kingdom is ever to be Americanized if essays like these are to be written and read in good faith, it is sometimes hard to see.

—The same number of the *Westminster* which contains the typical British essay on American literature—a literature in which, after all, meanly as most of us are disposed to think of ourselves, we have "The Federalist" in political philosophy; the speeches of Webster against Hayne, in oratory and politico-legal reasoning; the works of Story, Marshall, Kent, and Wheaton, in law; the romances of Hawthorne in prose fiction · the satire and wit of "The Biglow Papers," and the admirable products of the imagination as exercised in the creation of characters at once typical and individual; the profound criticism, so acutely apprehensive and comprehensive, of Emerson; the kindly universality of sentiment which makes Longfellow the chosen, well-chosen, favorite poet of a greater number of people than listen to any other English-speaking poet; the careful scholarship of Whitney, Child, Palfrey, Sophocles, Wyman, Noyes, Parkman, Lea, Morgan, and Agassiz—the same number of the *Westminster* which contains the essay with which we have been finding fault contains also an essay which, we are bound to say, is of such a character as to be of use to any one who should feel disposed to charge us with having done injustice to editors of English quarterlies, in saying of them what we have been moved to say above. One of the essays in the last *Westminster* shows quite sufficient knowledge of American affairs. It tells the story of the famous "corner" in the Wall Street Gold Market, which was effected by Mr. Jay Gould and Mr. James Fisk, jun., in September last. It is no more than fair to say that one might look far in our native newspapers and magazines before coming on any writer who has brought more local knowledge to the handling of this particular American topic. The judges of the New York Supreme Court, or the attorneys of the Erie Railway Company, could hardly themselves evince a more thorough familiarity with New York judicial and financial circles. We bespeak for it the attention of all advisers, friends, and enemies of Mr. Hoffman, Mr. Fisk, Mr. Tweed, and the Boston, Hartford, and Erie Railroad Company. To one aspect of American life—it will be confessed even by the editors of Boston newspapers, or by Mr. Wendell Phillips and Mr. S. P. Cummings—our English brethren have at last done something like justice.

—The question of the Pope's infallibility illustrates better than any other question which this generation is likely to hear discussed the rule that every doctor, from the doctor of divinity down to the horse doctor, habitually and regularly disagrees with every other doctor—possibly as the safest way of assuring himself and others of his having any right to the title. So far as we have heard, no two persons—outside of persons possessed of that "faith" which removes the mountain by shutting the eyes and asserting that there isn't any mountain—have come to anything like a practical agreement as to the significance of the latest of Roman dogmas. Dr. Ward, of the *Dublin Review*, could probably put his finger on several gentlemen under the personal charge of Cardinal Cullen, or that of Archbishop Manning, who would agree with him that, in case the Pope should casually assert of his new shoes that they were completely worn out, there would be small hopes of salvation for any Christian who, on inspection of them, should hold that the shoes were in good order, or that his Holiness had in that instance not spoken infallibly. Incredible as it seems, it is yet beyond doubt that there are people who are ready to go quite as far as we have imagined Dr. Ward going. What, indeed, can be incredible as regards the beliefs of a certain party among Roman Catholics when one hears it said of a very high dignitary of the church—an Englishman, too, and educated at Oxford—that, attempting to confute such bishops as opposed the promulgation of the new dogma on the ground that the time was inopportune, his way of convincing them was to look up the word "opportunity" in the New Testament, and point out to his opponents that it occurred but four times, and that in the most important of the four passages it relates to the action taken by Judas, when (Matthew xxvi. 16) he "from that time sought 'opportunity' to betray him"? But among the Roman Catholics whom Protestants, thinking of Mr. Ward and Archbishop Manning, would describe as comparatively sensible and reasonable, there would appear to be hardly two men holding the same opinion as to the scope and meaning of the dogma just enunciated by the Vatican council—if, indeed, there has been an enunciation so technically correct as to make a dogma binding. What is it, for example, for a pope to speak "*ex cathedrâ*"? What questions are questions of morals, in the sense of being such "questions of faith and morals" as the Pope, speaking *ex cathedra*, can pronounce upon? M. Gambetta, for instance, is a Catholic, let us suppose; could he expect from Pope Pius IX. an indubitably correct answer to an enquiry as to whether the present government of France is morally commendable in declining to make a peace? If a future pope revives and approves a doctrine which a former pope has denounced as heretical, is it true, as Archbishop Purcell would say, that the mere fact of such revival makes of the pope who effects it a heretic—a pope whom God there and then deposes? What, then, becomes of the bishops and priests who, believing the pope infallible, as they are bound to believe him, give internal assent to the heretical doctrine promulgated by the fallible corpse of a pope? Does God, there and then, at the time of their internal acquiescence, depose them also, and make of them heretics and laymen, instead of consecrated priests? But if there are no assenting priests, what becomes of the infallibility of the Pope? and does not the capacity of the priests to sit in judgment on a pope argue infallibility in them?

— These and a thousand other difficulties are naturally suggested by the utterances which, during the last six months, have been made by Roman Catholic teachers in all parts of the world. A common consent they seem to have in respect of but one thing—none of them has as yet done anything to call down on himself excommunication. How (without explaining it away) to explain this new dogma, and at the same time keep himself a Catholic whom the head of the church would not think devoted to eternal misery, no one not an Ultramontanist seems in the least to know. Whether the Pope himself would satisfy a thorough-going Ultramontanist his last public performance leaves doubtful. He, the other day, addressed to the Cardinals a circular letter, in which, protesting against certain acts of the Italian authorities now governing Rome, he would seem to say that King Victor Emmanuel's aldermen and policemen have succeeded in shearing away from him much, or all, of his power to govern the church as her infallible teacher ought to govern her. "Any one who possesses good sense," says the circular of which we speak, "will see and confess that, having no longer supreme power in the use of public means of conveyance, or in the public circulation of letters, we are really deprived of the necessary and speedy way of treating the affairs which the vicar of Jesus Christ must treat and administer." And again: "We find ourselves now wanting in that freedom which is absolutely indispensable to us, in order to govern the church of God." At first sight, this certainly looks like an infallibly true assertion, that the government of the church is no longer within the power of the Pope; and, as may be imagined, numbers of the Episcopalian enemies of the Babylonian harlot are rejoicing over what they assert to be the official announcement of the *décheance* of the Papacy—which, however, as they may probably discover, has a way of surviving suicide that says much for its vitality, or want of it.

— To what the Pope is referring when, in the circular above-cited, he speaks of the free use of "public means of conveyance," we do not know. As regards his power over the "public circulation of letters," the *Church Times*, London, volunteers some evidence which could no doubt get confirmation. "Just before the assembly of the Pan-Roman Council," says the editor of the *Times*, "an English gentleman, long resident in Italy, and of the highest literary reputation, made an offer to us through a common friend to supply us with letters on the subject. We immediately wrote out to the gentleman's address in Rome, but our letter, instead of being delivered, was returned to us about four months afterwards. In the meantime, our correspondent wrote expressing his surprise at receiving no answer, but his letter was likewise suppressed." Considering the nature of the documents proceeding from the Vatican, the Papal court is wiser in its generation, most people would think, to trust to the suppression of other people's letters than the circulation of its own. However that may be, the Romans are probably a sufficiently irreligious community—not to say a sufficiently blasphemous and ungrateful congeries of vermin—to be pleased with the recent change in the postal regulations of their city.

BRENTANO'S HISTORY OF GILDS.[*]

It is not until within a few years that the historical importance of the guilds of the Middle Ages has been recognized, and even now there are few who are aware how great this importance was and how extensive their influence, even outside of their municipalities. Dr. Brentano's treatise is, as the publishers say, "the first and only one in English reviewing the whole subject of *Gilds*;" and it deserves to be carefully studied, as well by those who wish to understand the development of mediæval society as by those who are interested in the present phase of the labor question, which is nearly connected with that of earlier times. It is hard to say, therefore, whether this book is more valuable as a contribution to history or to social science. In its treatment, however, it is rather historical than practical, and it is the historical aspect from which we propose to regard it.

Besides the trades-unions of the nineteenth century, three classes of guilds are treated of in this essay—religious or social guilds, guild-merchants, and craft-guilds—and each of these four institutions illustrates a distinct and important historical fact. The first class, of the religious guilds, was the earliest and most general in its nature—so general, indeed, that the term *religious* has been objected to, and *social* proposed. Our author defends the title in common use, on the ground that all, whatever their object, had a certain religious character, and grouped themselves about certain religious observances. For the matter of that, these features were common also to other guilds. The objects of those under consideration were as various as possible—some for charity, some purely social, some for special religious observances (as burning candles on the altar of the Virgin, maintaining sacred processions, or performing religious plays), some even for political objects. In fact, these early guilds seem to have exactly represented our modern clubs or societies, possessing just that degree of religious formality which everything had in those times, and marked also by a closer union among the members than is the case nowadays. Each had some saint as its patron, all had banquets at stated seasons, and all demanded and fostered a closer feeling of brotherhood in their members, with mutual aid and defence.

In regard to the origin of these institutions, Dr. Brentano agrees with Thierry that they were derived from the pagan sacrificial banquets of the northern nations, rather than with Wilda and Hartwig, who would give them a Christian origin. The guilds, he thinks, were organized on the type of the family, and were calculated to satisfy certain needs for which in an earlier state of society the family union had provided. In primitive times, "the family was a community of all-comprehending importance, and its care provided completely for nearly all the wants of the individual," especially in whatever concerned "the relations of private law—the legal protection of life, limb, and property." But in time "the natural bond of the family become more and more relaxed with the increase of the number of relatives, and with the rise of special interests among the individual members," and there was, moreover, a "constantly increasing number of kinless people and of strangers." The family was now, of course, inadequate to the new demands of society, while no public authority was yet in a condition to assume the protection of individuals; the guilds, then, modelled on the family and preserving much of its character, with a looser and wider organization, formed a convenient transition between the earlier order of things and the fully developed state.

---

[*] "On the History and Development of Gilds, and the Origin of Trade-unions. By Lujo Brentano, of Aschaffenburg, Bavaria, Doctor Juris Utriusque et Philosophiæ." London: Trübner & Co., 60 Paternoster Row, E. C. 1870. 8vo, pp. 135.

Perhaps the most interesting class of guilds is that of town-guilds or guild-merchants—frith-guilds the author often calls them, without anywhere explaining the term. These were associations of all the full citizens of a town, for the sake of self-defence and other objects of general interest; in such cases "the citizens and the gild became identical, and what was gild-law became the law of the town." But this identity was only temporary; "the quality of being a full citizen did not of itself include the fellowship of the sworn-gild; for this a special acceptance was required"—just as in the case of the "commoners" of New England towns, to which we alluded a few weeks ago. Consequently, in time the original guild became closed, and the families which belonged to it were developed into a patriciate, known as the *summum convivium*, which continued to govern after it had ceased to be identical with the city. Then other inferior guilds sprang up by its side. In this way many of the town constitutions of Northern Europe began in guilds, as described by Augustin Thierry in his "Considérations sur l'Histoire de France." In some towns the guild thus developed was only one of two or three municipal organizations, and our author hardly makes distinct enough the relation in such cases of this community to the other communities in the same town. Thus, in Note 3 (p. xi.), he speaks of the two communities which existed together in Worms in the eleventh century—that of the Bishop's Manor and that of the Old Freemen (in earlier times there had been two others, that belonging to the royal palace and that to the demesnes, *Stamm-gut*, the Salians, both of which were united under the rule of the bishop). From the Old Freemen were descended the patrician families of later time, while the bishop's vassals in the main became craftsmen. So in Ratisbon, the great emporium of the eastern trade, there were distinguished the king's city, the priests' city, and the merchants' city. These communities in a community resembled somewhat the Roman *plebs*, which formed a distinct, self-governing body subordinate to the patrician state. It would seem, then, that the town-guilds in such cases must have been confined to the city of the freemen or merchants, while in new towns the guilds comprised all the citizens. These town-guilds, as has been already intimated, consisted chiefly of merchants, and in many towns the terms merchant and burgher are synonymous; in Paris, for instance, the *mercatores aquæ* formed the municipal body, which probably explains the fact that in the seditions during King John's captivity, the government of Paris was in the hands of Etienne Marcel, provost of the merchants. These guilds it was that carried through the great movement of the enfranchisement of the communes and establishment of free cities in the eleventh and twelfth centuries, and that founded the powerful leagues of the thirteenth century.

It has been already said that the town-guilds became in time close oligarchies. At first, free handicraftsmen were admitted as members, but afterwards these were excluded, and the government of the cities fell entirely into the hands of the patrician families of old citizens. These, of course, did as such oligarchies always do—securing to themselves the privileges and emoluments, and throwing the burdens upon the lower classes. This led to the organization of craft-guilds, which carried on against the old guilds a struggle similar to that which these had carried on against the nobles, and with the same result. This struggle marks the fourteenth century, as the earlier one did the twelfth. Thus, in the old Roman city of Cologne, the power was, in the twelfth century, in the hands of the guild of Old Freemen or *rich*—the *Richerzechheit.* Then came a violent contest of two hundred years, the craftsmen striving to get a share of the government, and sometimes uniting for this purpose with the archbishop, whose aim was to rule over both. At one time, a coalition between these two overturned the rule of the patricians; but when the designs of the archbishop were understood, the "families" were recalled and reinstated in their privileges. This contest was ended in 1396 by a revolution which gave the craft-guilds a share, and even the predominance, in the government. Under the previous order of things "the craftsmen were," says Dr. Brentano, "almost the serfs of the patricians" in this city, while the patricians themselves, by their misgovernment, turbulence, and feuds (between the Overstolzen and Weissen) had quite wiped out the memory of their good work in a former time.

The crafts were now on an equality with the families, but their degeneracy was as rapid and as marked as that of the families had been. A kind of aristocracy of office holders developed itself among them, and they soon became close and illiberal in their policy. "In the place of an oligarchy of landed proprietors, an oligarchy of capitalists stept in." It was at this time that those selfish regulations with regard to admission to the trades were established, almost the same as some of the present demands of the trades-unions, which we are wont to associate especially with the Middle Ages, while in fact they characterize only its closing century. "In the fourteenth century commenced the transformation of the trades into entails of a limited number of families." It is important to note that at this time there was no marked division between employers and employed. The craft-guilds represented and embodied *the whole trade*, controlled, in fact, by the masters rather than the men, but masters who had themselves worked as apprentices and journeymen, and whose workmen expected themselves soon to be masters.

This consideration leads to the origin of Dr. Brentano's fourth class, the trades-unions, which he has treated with great fulness and interest. He does not consider these to have been *derived* from the guilds, as has been held, but rather as their legitimate representatives in the changed order of things, coming into existence, as they did, to meet an immediate want. As the craft-guilds sprang up in the Middle Ages to maintain the independence of industry against a landed aristocracy, so these have sprung up in the nineteenth century to defend labor against capital. The special cause of this new movement is found in the changed conditions of manufactories, resulting from the introduction of machinery. The necessary consequence of machinery was that the manufactures were concentrated in large factories, owned by large capitalists; naturally, there soon appeared an antagonism of interest between the capitalists and the laborers, and this led to the formation of trades-unions. Our limits will not allow us to enter into the detailed consideration of these. Their historical relations are sufficiently illustrated by what has been said, and the abuses which called them into being are described by Dr. Brentano with great vigor. The violence and unreasonableness of many of their actions and demands at the present day need not blind us to the good they have actually accomplished and may yet accomplish, if they will only leave politics and go to helping themselves—if, too, they will learn to distinguish what is just and practicable from mischievous chimeras.

HOLIDAY BOOKS FOR THE YOUNG.*

In renewing our annual survey of juvenile literature, mention shall first be made of the designs of Miss Chase, daughter of the Chief-Justice, illustrating some of Mother Goose's rhymes, and some not commonly found in nursery collections, with two or three from the French and German. The original drawings, numbering fifteen in all, besides initial letters, were in water-color, and have been fairly imitated by chromo-lithography. They will be sure to find favor with any child to whom they are shown, and deservedly so, as they are fresh and pretty conceptions, drawn with great freedom and tastefully colored, and exhibit a nice sense of humor in the artist. The figures are always spirited, if not all so correct as that of "Tom, Tom, the Piper's Son," which begins the series, but the perspective of which leaves something to be desired. The sad fate of the little old woman who had her petticoat shortened by the mischievous pedlar, is very well shown in the picture and initial letters; and the designs for "Old Tuskummik, Medicine Man," and "Chan-wan, the Good Old Man," with its companion-piece about "Ping-wing, the Pieman's Son," who

> "—— threw the cat in the boiling rice,
> And when they'd eaten her, said he,
> 'Me wonders where the mew-cat be,'"

are highly amusing. We can but think it a decided gain for our young folks that Miss Chase was persuaded to share her portfolio with the public.

"Holiday Pleasures" has all the appearance of having been written to suit Mr. Geissler's etchings, which are very well worth a fitting text. The "introduction" has no connection with what follows, which tells of the year's doings—month by month—of the little school-boy who is supposed to appear in every one of the twelve full-page pictures. There is no point to these narratives, which, however, are pleasantly told and in language carefully chosen for the age which it addresses. Mr. Geissler's children are of the same German type as Oscar Pletsch's, and drawn with as firm and sympathetic a hand, and his compositions, though they may not particularly interest the young, will improve their taste. Viewed merely as etchings, they are rather dull and monotonous, but we shall probably meet with few illustrations this season which will equal them in general excellence.

"Holiday Pleasures. With an Introduction, by the Author of 'Harry Lawton's Adventures.' With Twelve Etchings by Rudolph Geissler." New York: Pott & Amery. 1870.

"Daisy's Companions; or, Scenes from Child Life. A Story for Little Girls. By the Author of 'Grandmamma's Nest.'" Boston: Roberts Bros. 1871.

"The Brownies, and Other Tales. By Juliana Horatia Ewing. With Illustrations by George Cruikshank." Boston: Roberts Bros. 1871.

"Labor Stands on Golden Feet. A Holiday Story. By Heinrich Zschokke. Translated by John Yeats, LL.D." New York: Dodd & Mead.

"Daisy's Companions" belongs to a class of children's books that seems to keep in favor with the public, if we may judge from the reinforcements it receives on each return of the holidays; a class which we are inclined on the whole to think does a good work in spite of its over-refinement, the precocious virtue of its hero or heroine, and, above all, the romantic imagination it fosters and stimulates. But where the heroine is, like Daisy, not painfully pious, but really good—a genuine lump of sugar to take the lessons of generosity and amiability on—she may be welcomed into a household. And where the good-breeding is so thorough—alas! in how much of our juvenile literature it is lacking!—American mothers may not mind the frequent allusions to little girls' "maids," and other luxuries of an English household. The high flavor of romance is the most dubious quality of the book, but just there, of course, lies its success with the children.

"The Brownies" is another book typical of a class which has an adult audience in its eye, and not a childish one. Parents will certainly be much entertained by this clever effort, and may be able to translate "The Land of Lost Toys" and "Amelia and the Dwarfs" to their children, in a way to give amusement; but we are very much afraid that the little ignoramuses will never be able to master for themselves a style of which these are specimen sentences:

> "A gutta-percha cherub in a chronic state of longitudinal squeeze.
>
> "Not being a metaphysician, he did not understand that it is safer to found opinions on principles than on experience, since experience may alter, but principles cannot.
>
> "Boys will be boys; but there is a limit to the forbearance implied in the extenuating axiom."

But if the language is not, like Truthful James's, "plain," the ideas are very lively and ingenious, as for example the following. An old maiden lady, still fond of toys, dreams that she is in a province of Fairyland, to which all toys, and all things ever used by children as toys, eventually find their way. Their rank here is according to the value that had been set upon them, so that an old potato, the sole plaything of an Irish baby in a tenement-house, is in a high place, while the costly toys of the rich occupy back seats. The abused toys had resolved to avenge themselves on the first human being that should chance to find his way to their abode. The old lady finds herself surrounded by the victims of her carelessness and is comically threatened:

> "'Tie a string round her neck, and take her out bathing in brooks,' said an old doll. 'Tear her wig off! Scrub the paint off her face! Flatten her nose on the pavement! Saw her legs off and give her no crinoline! Take her out bathing, I say, and bring her home on a wheelbarrow, with fern-roots on the top of her.'
>
> "'Take her to pieces to see what she's made of!' said a German toy.
>
> "'Dip her in water, and leave her to soak on a soup-plate,' said a paint-box."

She is finally put to bed in the doll's bedstead, and immediately breaks through on touching it.

A book for older children than any of the foregoing, and indeed composed for adults who are children from lack of education and from their condition in life, is "Labor Stands on Golden Feet." The maxims in which it abounds, and its examples of honest industry making a way to competence and public esteem, are likely to do good to thoughtful boys as well as to the laboring classes, and the former will find the story interesting enough to make them wish to read it through. Much of the purpose with which it was written depends upon a state of society which does not exist in this country; but for the formation of personal character, no part of the narrative is superfluous. The plot is extremely simple; there are two wooings, not difficult to foresee in either case; and the star of the travelling tinker continues lucky to the end. The author makes an effort to reconcile the institution of guilds with the progress of the age in the application of science to the arts. This discussion will probably be skipped by his young readers, and without much loss; but it would be well if some one would tell them, in an attractive way, what there was sound and true in the old system that might survive it to advantage.

*** Publishers will confer a favor by always marking the price of their books upon the wrapper.*

JUST PUBLISHED BY

PORTER & COATES,

822 Chestnut Street, Philadelphia.

Longfellow's Poets and Poetry of Europe.

A New and Revised Edition, just completed, by H. W. Longfellow, with the addition of 150 pages of entirely new matter never before published, making it one of the most elegant and complete works extant. With Introduction, Biographical Notices, and Translations, from the earliest period to the present time. By Prof. Henry Wadsworth Longfellow. Illustrated with engravings on steel and engraved title. Imp. 8vo, cloth, extra gilt top, bevelled boards, $6; sheep, marble edges, library style, $7 50; half-calf, gilt, $9; Turkey morocco, $12.

"This valuable work contains selections from about four hundred authors, translated from ten languages. Mr. Longfellow himself gives us translations from all these languages but two."—Allibone's Dict. of Authors.

"This edition has been revised and enlarged by the author, and contains his last touches and additions to his labors."—The Age, Philadelphia, Nov. 3, 1870.

"It is now a better book than ever, the Professor having added an Appendix and a Supplement, the latter dated 1870, containing a very precious list of newer poetical translations. . . . The supplement is very choice and interesting, and absolutely rejuvenates the work. Here we have specimens from Bayard Taylor's translation of 'Faust,' not yet received in complete book-form, etc., etc."—Evening Bulletin, Philadelphia, Nov. 5, 1870.

Hedge's Prose Writers of Germany.

A NEW AND REVISED EDITION.

With Introduction, Biographical Notices, and Translations. By Frederic H. Hedge, D.D. With Six Portraits on Steel and Engraved Title. Imperial 8vo, cloth extra, gilt top, bevelled boards, $5; sheep, marbled edges, library style, $6; half-calf, gilt, $7 50; Turkey morocco, $10.

"There is no book accessible to the English or American reader which can furnish so comprehensive and symmetrical a view of German literature to the uninitiated; and those already conversant with some of the German classics will find here valuable and edifying extracts from works to which very few in this country can gain access."—Prof. A. P. Peabody, in North American Review.

"A new and beautiful edition of a work of sterling merit."—The Age, Philadelphia, Oct. 29, 1870.

"It is a photograph such as is very much needed at this juncture for instant study."—N. A. and U. S. Gazette, Philadelphia, Oct. 27, 1870.

"Universally recognized as one of the best collections of specimens of German literature in the English language."—New York Tribune, Oct. 28, 1870.

"Its merits and value are well known. In this enlarged edition it will be sure to find renewed favor."—Boston Post, Nov. 3, 1870.

NEW YORK, THURSDAY, DECEMBER 1, 1870.

The Week.

THINGS are approaching a crisis on the Loire. The Prussians, under Prince Frederic Charles—who probably holds the chief command of the co-operating forces—on the left, Von der Tann in the centre, and the Grand-Duke of Mecklenburg on the right, press on the French army before Orléans and the troops covering Tours, in a semicircle extending from the vicinity of Montargis, opposite Gien, to the vicinity of Vendôme, opposite Blois. Fighting, mostly on a small scale, has been going on for a number of days at various points along the front of the French army, the Prussians demonstrating in force, chiefly between Montargis and Beaune, against the extended and exposed French right. The most important engagement thus far took place November 28, near the latter place, the advantages of which are claimed by both sides. The wooded heights extending from Gien to Chevilly, in front of Orléans, seem to form the principal strength of the position occupied, and artificially fortified, by D'Aurelles de Paladines; but the weakness of his left flank was betrayed by the abandonment of Châteaudun, in consequence of the threatening concentration of Prussian forces on the opposite side. His communications with Tours can thus hardly be said to be secure. Nor is it likely that the force lately commanded by Kératry, which, after the engagement at Dreux, was unable to oppose the advance of the Grand-Duke's forces on the line of Châteauneuf and Nogent-le-Rotrou, towards La Chartre and Vendôme, will now be able to execute an effective diversion for the relief of the temporary capital.

In the North, Picardy has been the theatre of active operations. Considerable bodies of troops of General Manteuffel's command having joined the forces which had long but steadily been operating against Amiens, the offensive was more energetically resumed towards the close of last week. After some sharp fighting, with varying success, around Demuin, Moreuil, and Boves, a stubbornly contested engagement took place on Sunday, the 27th, east of the latter place, near Villers-Bretonneux, which lasted till late in the afternoon, when the French were compelled to yield to the superior forces of the assailants. The struggle was continued at Boves, and further west at Dury, but finally the Army of the North was forced to abandon its last positions around Amiens, which was occupied on the 28th by a division of Manteuffel's army. The Prussians have thus, after repeated and energetically resisted attempts, become masters of that important city and of the rich valley of the Somme, a river which will now form a strong military line between the fortresses of Artois and Nord—the supporting points of the Army of the North—and the great commercial towns of Normandy—Dieppe, Rouen, and Havre. In which direction that army has retreated, whether towards Artois or towards Normandy, is not stated. South of Rouen, the Prussians have occupied Evreux in force.

Almost simultaneously with Amiens, La Fère, after a very gallant resistance, surrendered to the Prussians. This conquest secures to the latter unbroken connections between Picardy and Isle de France and Champagne, and completes the separation of the strongly fortified north-eastern border of France from the rest of the country. It is not likely that the Prussians will attempt the reduction of any of the fortresses on that border situated west of the Meuse, and there is no improbability in the report of their having abandoned the investment even of Mézières, on that river; but they continue their efforts to reduce Montmédy and Longwy. Thionville has surrendered, after a terrible bombardment. An unsuccessful sortie is reported from Belfort. A severe fight in the vicinity of Dijon, between a considerable detachment of Garibaldians and some troops of General Von Werder's command, resulted in a disastrous rout of the former. The Prussians in that region, however, appear to have made no further advance towards Autun or Châlon-sur-Saône, and their movements, as far as reported, are hardly sufficient to indicate the main object of their operations.

Most of the communications received from Paris agree in representing that capital as sorely tried by incipient famine, want of fuel, and increasing ravages of disease. According to some of those communications, the condition of the besieged two millions is such as to render a speedy capitulation not only desirable even to the patriotic, but a matter of utmost necessity, unless a successful sortie on the grandest scale puts an end to all the miseries of the siege—for the hope of a relief by the Army of the Loire, or any other army in the field, is now cherished by few rational beings in the city, or out of it. To attempt such a sortie, however, without a simultaneous attack on the Prussian lines taking place from without, is something which only a criminal disregard for human life could suggest, and Trochu is hardly the man to venture upon an enterprise of this kind. It is, therefore, not surprising to hear that some of the Parisian journals, such as the *Journal de Paris*, the *Gaulois*, and the *Figaro*, have finally come out with protests against an indefinitely protracted defence of the city, and in favor of the conclusion of peace. Should this demand for peace become louder with growing famine, and the issue of the battle now imminent on the Loire be such as not to encourage hope, Trochu and his associates would have a probably desired opportunity of yielding to the dictates of common sense, while pretending to yield to public pressure. In the meanwhile, however, cannonading from the forts and demonstrations beyond them continue to take place from time to time against the Prussian positions.

The whole of the news points in the direction of the catastrophe on the Loire which we ventured to foreshadow last week—the destruction either by crushing defeat or wholesale capture of the army of D'Aurelles de Paladines, and the flight of the Tours Government further south. Paris would certainly not hold out after receiving the news of such a disaster, even if it does not fall sooner before the ravages of hunger and disease. There is something sad in the eagerness with which the French continue to buy arms, and the exultation with which they announce the arrival of their purchases, as if they were suffering or had ever suffered from want of men or rifles. The things they need are things time only can supply—and time they cannot have. Their fall, as well as that of the Austrians in 1866, seems to prove pretty conclusively that great disasters in the early part of a campaign will hereafter rarely be recovered from by the vanquished; the victor is able to follow his advantages up too rapidly in highly civilized countries.

The news of the Turco-Russian complication continues to be pacific. The exact position of the English Ministry in the matter is a little difficult to make out. There are rumors that Earl Granville's ground is too bold for his colleagues, and that they are disposed to repudiate him. On the other hand, the average public opinion seems to run in favor of war, while some of the more prominent Liberals, John Stuart Mill for instance, have come out against war; but it is safe to say that the public will be ready enough to fight if the war seems likely to be naval only. But there is evidently no disposition on the part of Russia to force matters to a crisis; and while neither side will recede from its position, no overt act will be committed, and the affair will, it seems most likely, drift into a general Congress, summoned either to deal with that solely, or—if Paris falls soon—with the whole European situation, which is still full of danger.

In the money markets dulness reigns supreme. Speculation in stocks seems a thing of the past. Government bonds continue firm, and have not varied materially throughout the excitement in the London and Frankfort markets. There is an animated discussion going on over Mr. Boutwell's funding schemes, as foreshadowed in despatches from his friends in Washington, and over the probable fate of his efforts against the national banks and the Pacific railroads, in which he is likely to have the whole financial community against him, while all the rest of the country will be on his side. The uncertainty as to his action tends still further to diminish operations. The more peaceful tone of the latest European news has put down gold a trifle. Money, in the absence of all demand for business purposes, continues cheap and apparently abundant. The momentary uneasiness caused by last week's failures seems to be forgotten, and the only point to which any one looks for the least interruption to the present dead calm is real estate, which is getting into a rather precarious condition, from the almost total absence of buyers.

None of the varying reports of peace or war have been able to move our markets to any extent. Cotton has not varied more than one quarter of a cent per pound, in spite of various domestic influences tending to unsettle the price, while flour and wheat, under heavy receipts, have been lower. Groceries are somewhat lower, and fruits of every description, both foreign and domestic, are unusually abundant, cheap, and of superior quality. A notable feature of business during the week has been the marked falling off in the Thanksgiving-day trade, which dealers report smaller and more unprofitable than for many years past, indicating anything but general prosperity, and foreshadowing a probable decline in many articles of food during the coming winter. The whiskey trade, an interest of great importance to farmers, continues disorganized, many distilleries preparing to stop work, owing to steady losses; corn, however, remains firm. Meats of all descriptions are lower, and altogether the prospects of consumers are somewhat improved.

There has been a good deal of activity among the "Revenue reformers" during the week. On the 22d ult. they held a private meeting in this city, which was attended by Mr. D. A. Wells, Mr. George Walker, Mr. Horace White, of the Chicago *Tribune*, Mr. Bryant, Mr. Bowles, of the Springfield *Republican*, and others, and at which, after a good deal of talk, the conclusion was reached that things were looking very well; that the legislative debates of the coming winter would, under the influence of the late elections, probably do a great deal to educate the public and prepare the monopolists and jobbers for what is certainly coming; and that the question of civil service reform was closely connected with that of the reform of the revenue, and ought to be discussed and pushed with it; and it was resolved finally to charge a committee with the work of looking after the interests of both in a general way during the winter, with power to make arrangements for the calling of a national convention in the spring, in case the course of Congress proved unsatisfactory. The usual distribution of "British gold" did not take place, it must be confessed to the regret of all present. Indeed, the desire for it, and for as much of it as possible, was avowed with the greatest effrontery. The open display of such feelings at a reform meeting was a curious sign of the times. Why the British should have cut off the supply was not explained, but we presume they were unable to withstand the repeated exposures in the *Tribune*, which have doubtless made Mr. Thornton wince a little.

The feeling nevertheless gains ground, that if Mr. Wells is bribed by the British, so is Mr. Greeley, their fighting being what is termed at the police courts a "put-up job;" Mr. Greeley playing the part in the discussion which Scepticus plays in the dialogue with Fidelis in the tracts which defend revealed religion. In these, it will be remembered, the argument is thrown into the form of a dialogue simply to make it more attractive to the frivolous, but Scepticus, almost from the first, behaves like an imbecile, and, after having opened the debate in the most bullying and insolent way, submits afterwards to a disgraceful defeat with the most ludicrous equanimity. Of course nobody imagines Mr. Greeley will permit any such termination to the controversy as this; but people begin to wonder how long the present vehemence on his part will last. He has, during the past week, been rapidly repudiating "British gold" as a key to any of the free-trade positions, and, we are bound to say, has grown much fairer in his treatment of the subject than he used to be. The *Tribune's* full report of the proceedings at the Revenue Reform dinner is something which all friends of good journalism, whether they care anything about revenue reform or not, must admire.

We make this personal reference to Mr. Greeley as synonymous with the New York *Tribune*—in spite of his recent protest, and in spite of our fixed conviction that the newspaper etiquette which forbids such reference in treating of the editorial matter which appears in a paper is founded on the wisest expediency, and is a help no less to good morals than good manners—simply because he insists on protruding his personality into the editorial columns of the *Tribune*. He frequently signs its leading articles, and frequently fights out purely personal quarrels, and makes personal explanations, and follows up his personal enemies in them. Not long ago, he solemnly, in an editorial paragraph, contradicted a story that, having been unsuccessful in fishing, he had sworn so horribly that he had shocked and alarmed the boatman, who put him ashore, and refused to take him out again.

The Revenue Reform dinner had for its principal feature Mr. Wells's speech, which was a model of its kind, and told, in a very effective way, the story of his conversion, under the influence of his own investigations, from extreme protectionism to the position in which he now stands, which he says is that of a thorough believer in the free-trade theory, but who nevertheless believes indirect taxation best suited to this country, and the manufacturers who have invested capital under the protectionist régime entitled to time and opportunity to extricate themselves. There is no doubt of the soundness of all this. One of the most shameless and injurious features in the present régime is the haste and recklessness with which duties are run up and down, and one of the most prominent features of anything purporting to be a reform should be slowness, and caution, and respect for vested interests. Industry can stand anything better than uncertainty, or rather needs certainty more than anything.

Additional election returns from the States of North Carolina, Alabama, and Arkansas point more definitely than to anything else to dangers ahead for the Administration, and for the Republican party, unless the party can change the Administration's general policy and its own policy in regard to reconstruction. This latter, however, it is hardly worth any one's while to consider any longer; we imagine that it would be difficult to get a respectable minority of even a resuscitated Congressional Committee on Impeachment who would not now condemn the President's interference in the North Carolina troubles of last summer and the Alabama troubles of to-day. All that is done and over, and the force of habit itself cannot make even back-country editors talk of it this fall with any seriousness. Apparently the President is of a different opinion. In Alabama, the Democrats having carried their State ticket, the Republican Governor and Treasurer, whom the victory displaced, refuse to vacate their offices, on grounds which seem to them sufficient, but which are condemned as utterly inadequate by even the Republican members of the Senate. All but two of these officials express indignation at Governor Smith's conduct; but that functionary calls on the Federal commander in Montgomery for troops and has them supplied him. By these his rooms are now guarded, and bid fair to remain so till the case goes before the courts, when there is small doubt that he will be ousted. There is still less doubt that the people are heartily tired of seeing Southern Republican governors, considering what manner of men they are, making requisitions for United States soldiers, and making them when the Legislature is in session, or in the act of going into session. Meantime, a contest has been raging over the United States Senatorship; a great deal of hostility to Warner, the present incumbent, being shown by many Republicans. These are very bitter against him—for reasons not stated. No one Southern Senator of the carpet-bag order has shown himself an ornament to the chamber; but of specified charges against Warner we know nothing.

In North Carolina, the election to fill a vacancy in one of the Congressional districts resulted in the election of a Democrat by a majority greater than that which the Democracy obtained in August last. This result might have been less reasonably expected had Manning's competitor for the place not been the more notorious than celebrated Mr. Joseph Holden, a son of the Governor of the same name, but apparently not possessed of his father's cleverness, if we may judge by his conduct of the Raleigh *Standard*, the family organ. In South Carolina, the Conservatives or Reformers, as they call themselves, are reported since the election as being in a state of apathetic despair as regards the political future of the State. Perhaps they have reason when it is the fact, for instance—as we know it to be, on testimony for which we can vouch—that some of the election inspectors unblushingly permitted such open frauds as the casting of ballots by the negresses as well as by the men, and there will be plenty of proof of similar irregularities when the seats are contested. But again, perhaps in these facts the white men of the State have reasons against despairing rather than in favor of it. The Whittemores and their like no doubt get some of their power over their ignorant constituents because it is yet too soon for the negro quite to trust the white man, even when planted on the best of platforms, and influenced, let us grant, by motives sincerely good, but some, at least, of their power is based on the mere ignorance of their constituents, and on their own as yet undetected rascality, and their prosperity has not the elements of stability. Its supports can in no long time be taken from under it by patient fair treatment of the negro population, and sincere co-operation with him for the common benefit in political labor and investigation. The State grows richer in spite of its plunderers; the colored politicians must always be few in comparison with the colored laborers; and long before there is time or opportunity for the corruption of the latter by the example of the former, the laborer, if fairly treated, and if fully accepted as a political co-worker, will have forsaken the corruptionist demagogues, or else have driven them to comparative decency.

In the neighboring State of Florida, it may be very well doubted if the same thing is true for longer than the present year. The latest advices would appear to show that the Republican candidate for Congress has been successful by the bare skin of his teeth, having a disputed majority of about 200 over his Democratic opponent. There is said to have been a good deal of intimidation of voters and some fighting, and, though news is scarce, this assertion is probably true; yet a Republican majority of about four thousand in a voting list of some thirty thousand, is not a Republican majority that looks as if it would stand the test of many years of Southern politics, as Southern politics go now—especially in States where men like Governor Reed are the exemplars of the party principles. In Arkansas, there is appearance of the Democrats having carried the State and caused the Congressional delegation to stand two to one in their favor instead of one Democrat to two Republicans as now. On the whole, the drift in the South is in the wrong direction, and there will have to be much heedful watching this winter.

The expected lecture from General Butler on the political situation has been delivered in Boston, and, as we remarked last week, the amount of attention it has received, and the amount of space that has been accorded to it in the papers, are enough to make one sad. The General has been in the employment of the Republican party for about four years, and, apart from his services in the Impeachment case, the only work he has done above-ground has been an attack on the public credit, in the shape of a proposition to pay the bonds in paper, and another to reduce the interest by "a tax" on it; the advocacy of an unlimited issue of greenbacks, somewhat in the style of Law's Mississippi scheme; and now he appears with a plan for getting up a war with England. Its principal features are a repudiation of the rules of international law in settling our disputes with her, and an open resort to the general ground of hostility, this to be followed by non-intercourse, or war at our pleasure. He says the expense of war could be paid by the increased stimulus given to manufactures. The most striking thing in most of the General's productions, after the rascality of them, is the gross and wild ignorance they display, and this is no exception to the rule. The plan is, on the whole, such a one as one might expect to issue from the brain of a fuddled bar-keeper; and when we consider that its author is now supposed to be high in General Grant's confidence, and got between two or three thousand people to listen to his rubbish in Boston, one feels more than ever that it is not "caste" which is preying on our vitals. On the other hand, the lecture has been treated by the whole of the respectable press with thorough contempt, and has, we think, let the lecturer down a few steps more in his political decline, which will be very rapid, as long as he is unable to get up a row. Order and quiet suffocate him.

We find the following in a letter from Mrs. Martha C. Wright to Mrs. Cady Stanton, in the last number of the *Revolution*, referring to our recent paragraph on the sapient despatch of Mrs. Emilie J. Meriman to France as a "peace advocate and commissioner":

> "The *Nation* alludes, with its usual discrimination and amiability, to our convention, mistaking the mere reading of Mrs. Meriman's letter for the decided action of the convention, and characterizes its members as 'reformatory geese!' 'Be sure you're right, then go ahead,' is not one of the *Nation's* rules."

We are very sorry to be disagreeable to Mrs. Wright in any way, but, under the circumstances, it becomes our melancholy duty to quote the following from a very full report, the accuracy of which has never been questioned, of the proceedings of the convention in question by the *New York Times* of October 22:

> "Rev. Mrs. Olympia Brown then made a brief address, after which the resolutions were adopted. A letter was then read from Mrs. Emilie J. Meriman, who has just arrived from France, and who intends returning to that country, asking the sympathies of American women in behalf of peace. After the reading of this letter, the following resolution was adopted:
>
> "*Resolved*, That, having full faith in the potency of moral power in the problem of the world's peace, we, in behalf of the women of America, do constitute and accredit our countrywoman, Mrs. Emilie J. Meriman, our peace advocate and commissioner, to proceed with all dispatch to France to present the gravity of considerations of peace to William, King of Prussia, and to Jules Favre, Minister of Foreign Affairs for France, and to intercede with them for peace."

The discussion about the annexation of Alsace and Lorraine in Germany is just now marked by a striking incident. A portion of the manufacturing interest of the Zollverein have come out with a protest against the annexation, on the ground that it will bring 870,000 spindles and 14,000 looms into competition with them. They therefore demand either that the annexation shall not take place, or that the cotton goods of Alsace and Lorraine shall be excluded from the territory of the Zollverein for at least a year, if not longer, in order to give the Germans time to prepare for them. This has called forth a storm of indignation from the political press, which says that whatever the national honor and safety require must be done, no matter what becomes of the cotton or woollen interest, and that, in any event, the interests of 40,000,000 of consumers are to be thought of before those of a small number of producers; and that, as the former will clearly be benefited by the opening of the frontier to Alsatian goods, the protectionist objection to the annexation is really an argument in its favor. They might add that the very least that Germany can do for the unfortunate people of the newly-acquired provinces, is not to shut them out from their very best market at the moment they most need a ready sale for the products of their industry. First to conquer, then annex them, and then, after having secured the exclusion of their goods from France, to exclude them also from Germany, would be the refinement of cruelty.

THE "HIGH PRIORI ROAD" TO RUIN.

Descartes laid it down that the first step to be taken by anybody entering on a course of philosophical speculation was to make a complete clearance from his mind of all existing beliefs, so as to enter on his work in a state of universal doubt and interrogation. Whatever may be the value of this expedient, there is one condition essential to its success, and that is that the mind thus cleared be the mind of a philosopher; and as long as philosophers only resort to it, if it does no great good, it is pretty sure to do no harm. Unfortunately, however, we are witnessing an attempt in France—and the present attempt is only the latest of many—on the part of "the average man" to apply this method to the work of practical politics, and there is a strong disposition among the class of reformers to which we have taken the liberty of applying the term of "Sentimentalists" to try it to the extent of their power in all countries. The process, as they all practise it, is very simple. The first thing done is to resolve that whatever is, is wrong; that the fact that a thing has existed raises a presumption against its utility; and that it is at any time open to any community to tear down all its institutions, and to build up new ones, on a philosophical basis, constructed out of the inner consciousness of its more voluble members. It consists, in other words, of the adoption of the Cartesian method by a great crowd of persons, the best of whom have little mental training of any kind, and the mass of whom are very ignorant, and in their total release from what is perhaps the strongest, and for political purposes will have to be the strongest, of the social forces, at least till the human race has entered on a stage of culture from which we are certainly still ages distant—viz., habit.

It is perhaps fortunate for mankind that the French took upon themselves to try this experiment eighty years ago, before their brother Sentimentalists in other countries were quite ready for it, and that we should now be witnessing the close of it before the delusion which prompted it had spread any further or gained more power. France was, at the first Revolution, made a *tabula rasa*, and in the process an enormous amount of rubbish was unquestionably swept away. If the French nation, and especially the Parisian portion of it, had then been composed of philosophers of the first order, doubtless something very fine might have been built up on the cleared ground. They went to work as if they had been philosophers, however, and as if the community were as wax in their hands, and as if they despised the past and could defy the future. Their mode of reconstruction was very simple—namely, to create out of their imagination a set of ideals, and treat them as actually existing powers, to which it was only necessary to give full liberty of action in order to secure the happiness of the nation. One—and, we need hardly say, the first in order of these—was The People, which was always spoken of, not simply as the aggregate of the human beings inhabiting the national territory, but as a moral person, not only of great strength, but of consummate wisdom, purity, and goodness, which never erred, was never deceived, and, if let alone, was sure to do all things well, distribute justice, respect rights, and employ the proper agents of its will. How its will was to be got at never clearly appeared. A popular vote was never accepted as a satisfactory expression of it, as it was always said by those against whom the vote went that the essence known as the "People's Will," in passing through the gross medium of the ballot, became corrupted and distorted; and it generally turned out that if you wanted to get at the real thing, the proper course was to attend a lecture by a certain orator, on a certain evening, in a certain hall, where, for a small sum, you would have the genuine extract supplied to you on any subject of interest. This of course was only true as regarded general questions. If you wanted to know the People's Will as to who should fill a public office, you got it in a different way—namely, from a knot of gentlemen called a club or caucus, who "thought it out" in a private room. This type travelled far and wide. It made its way to the United States, to England, and to Germany, and has to this day a powerful hold on the popular imagination in all of them. In all of them, though in the United States, ever since Jefferson's day, more than in the others, the People still sits apart, looking after things—a mysterious but terrible abstraction, before whom all tremble and adore—who selects not only the best governors and sheriffs but the best judges; but has to have the custom-house clerks changed about once a year, and is made perfectly furious by talk of competitive examinations; and hates precedents and books, and political economy like poison.

The next type was The Republic. This was an ideal organization got up by The People for the banishment from the earth of poverty and crime, and the establishment of truth and justice. Its armies were invincible, and remain so to this day; its generals men of matchless skill and valor: its courts wise and incorruptible; and love its only law. It was the hold of this type on the popular imagination, and its complete separation in the popular mind from all experience, which led to the extravagant declarations which followed the overthrow of the Empire at Sedan. The New York *Tribune* called attention the other day to the folly of the Provisional Government in protracting the war by declaring, as soon as it took office, that it would not cede "an inch of territory or the stone of a fortress." But this was preceded by a still greater folly, consisting in a declaration that the Republic would make no peace as long as a single Prussian remained on French soil; so that the very first proposition made by the Republic to the Prussians was that they should go back across the Rhine, and there treat. Now, this tone was undoubtedly taken, even by a man of such ability as Jules Favre, under the influence of that sovereign faith in the mysterious power to control circumstances enjoyed by this abstract Republic, which, in the minds of Frenchmen of the democratic school, is not a political organization made up of Frenchmen as all the world knows them—that is, the Frenchmen of to-day, who have served two military tyrants within the present century with the greatest devotion—but a being of vast strength, raising great armies with the wave of a wand, and hurling them, under matchless leaders, on the helpless foe, and diffusing happiness and plenty through a smiling land on the return of peace. The wild exultation which followed the proclamation of the Republic at Paris was really due to the secret belief that there was some magic in the name that would take the poison of eighteen years of servitude and profligacy from French veins, and enable demoralized armies to recover in a day their discipline, and courage, and self-respect. The mania, too, as might have been expected, crossed the Atlantic, and found plenty of victims here. King William and Bismarck were savagely abused by some of our own Sentimentalists, because their earthy eyes did not also see the bright vision and bow before it; give his sword back to De Failly, because he was now a soldier of the Republic; and listen with awe to the utterances of Flourens and Rochefort, who were two of the high-priests of the new deity.

Another of these imaginary types rapidly growing up here among ourselves is Woman; not woman as we all see her and know her, and as the world has known her since the dawn of history, but a Woman of the mind, whose subordination to man, in the family and in society, and exclusion from politics, have been the great, if not the sole, cause why the People and the Republic have hitherto failed in putting a complete end to human misery. Woman it is, now, whose participation in affairs is to bring our criminal jurisprudence to perfection, banish corruption from our politics, vice from our streets, inefficiency from our public service, and, in short, save modern society from all the evils which most afflict it. If you ask where this Woman is to be found, you find that she has never been embodied in the flesh; she is an abstraction made up of the attributes of various remarkable women—of Miss Cobbe's intellectual power, Mrs. Josephine Butler's electioneering talent, Mrs. Cady Stanton's dignity, Miss Susan Anthony's activity, Mrs. Howe's eloquence, Queen Victoria's domestic virtues, and the administrative ability of divers Hindoo princesses; and we are asked to believe that, when this combination is brought to bear on our affairs, we shall have a new earth. A striking illustration of the golden haze which surrounds her is to be found in the protest made by the Boston Woman's Rights advocates against the extreme ground which has been taken up by Mrs. Cady Stanton and the New Yorkers on the question of marriage and divorce. The former are resolutely opposed to all discussion of this subject now; but they promise that when Woman makes her appearance in the Legislature, and comes to debate marriage with Man on equal ground, something—they do not say what—will be done which will make marriage what it ought to be. Now, as there are only three things any human legislature can do about marriage—(1) make divorce easy; (2) make it difficult; (3) or abolish marriage altogether—and as the two first plans have been in full operation in various parts of the world under male auspices, and as the last has been tried by various persons already without any legislative sanction ever since the creation, and not one of them has thus far seemed to hasten the millennium, the notion that when Woman takes the thing up husbands and wives will live together in lifelong peace, is evidently another form of the delusion under which the unhappy Frenchmen are hurling defiance at the Prussians.

The condition of France ought to be, and we trust will be, a solemn warning against the whole process. No healthy national life and no sound political system can be built up on it. The basis of everything good in politics is *character*, and no character can be strong whose owners habitually live in dream-land, and treat their own fancies as forces capable of governing the world. Such people always shirk the facts of life, and the more they shirk them, the harder it becomes to face them. They begin, therefore, by deceiving themselves; they end by deceiving others. The result is general mendacity and moral rottenness; and, finally, Sedan and Metz. The day is sure to come when valiant, self-reliant men are needed to stand in the breach or face the iron shower, and nothing is found but rhetoricians and poetasters and demagogues; when naked, unadorned truth is needed to save the nation, and the air is filled with lies; when strong brains are needed in the council chamber, and the table is surrounded by hysterical declaimers, wailing over the break-up of their own illusions, and telling a scornful world that if everything had gone differently, things would not be as they are.

MONOPOLIES AND THE FOURTEENTH AMENDMENT.

It may be remembered by some of our readers that at the time of the passage of the Fourteenth Amendment certain politicians objected to incorporating it in the Constitution on the ground that, though only intended to establish the civil rights of negroes, its terms were so far-reaching that it might possibly be construed by the courts into something much more dangerous. A curious case has recently arisen in Louisiana which will probably result in a determination of this question by the Supreme Court at Washington. The facts of the case were these: For a long time back the health of the inhabitants of New Orleans is said to have been endangered by the presence of innumerable slaughter-houses, scattered through the city with less regard for its sanitary condition than for the convenience of the butchers. With the ostensible design of improving the health of the city, the Legislature of Louisiana, in 1869, passed an act, the practical effect of which was to incorporate the *Crescent City Live Stock Landing and Slaughter-house Company*, and to give it a monopoly of the business for twenty-five years, within a certain district. The act directed the discontinuance of all other yards, slaughter-houses, and stock landings. The new company were to be entitled to levy tolls on all cattle slaughtered at their shambles. The avowed object of the act was to localize a business which the hot climate rendered dangerous to the health of the inhabitants during certain portions of the year—in other words, it was enacted as a police regulation. Whether the minds of the legislators who passed the bill were in reality influenced by sanitary or by pecuniary considerations, we have of course no means of knowing. It is enough for us to know that its passage caused great dissatisfaction among the butchers of New Orleans, who found their business sadly interfered with, and at once applied to the courts for relief. The Supreme Court of Louisiana sustained the monopoly, and the contestants thereupon went into the courts of the United States. The suits brought were innumerable; but the case which has recently been decided by Judges Bradley and Woods in the Circuit Court is the most important. The Court (Mr. Justice Bradley delivering the opinion) held, in substance, that the monopoly in question was unconstitutional under the Fourteenth Amendment, which declares that all persons born or naturalized in the United States, and subject to its jurisdiction, are citizens of the United States and of the State wherein they reside, and that *no State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any State deprive any person of life, liberty, or property without due process of law, nor deny to any person within its jurisdiction the equal protection of the laws.* The reasoning by which the court reaches this conclusion is this: Although the privileges belonging to citizens of the United States, which the Amendment secures, and which a State cannot by its laws abridge, may be difficult to define, "we may safely say that it is one of the privileges of every American citizen to adopt and follow such lawful and industrial pursuit, not injurious to the community, as he may see fit, without unreasonable regulation or molestation, and without being restricted by any of those unjust, oppressive, and odious monopolies or exclusive privileges which have been condemned by all free governments." "There is no more sacred right of citizenship than the right to pursue unmolested a lawful employment in a lawful manner. It is nothing more nor less than the SACRED RIGHT OF LABOR." As the act incorporating the company in effect prevented the butchers and live-stock men of New Orleans from pursuing their lawful calling, it interfered with this right, and was unconstitutional. Such is the reasoning of the court. The case will probably come before the Supreme Court, and will there receive full consideration. Meanwhile, we desire to call attention to the decision, for its scope is, as we believe, very broad, and strikes not merely a blow at a New Orleans slaughter-house company, but at the existence of almost every franchise in the United States.

Every patent, every railroad franchise, every canal, turnpike, and ferry company in the world is a monopoly. They are all cases of exclusive rights, vested in a small number of private persons. A railroad franchise, for example, confers an exclusive right of carrying passengers and freight between two designated points; it is absolutely exclusive of all the world, since any one who attempts to conduct this business within the established limits—or, in other words, over the company's tracks—renders himself liable to an action. In the same way, a patent confers an exclusive right to manufacture and sell a particular article for a certain length of time, and unquestionably infringes the sacred right of labor, if anything of the kind does.

To these arguments Judge Bradley replies in the following way: He says that the right to labor is not infringed by the issue of patents, because "society only gives to" the patentee "the temporary exclusive use of that which, without him, it would not have had the benefit of, as a consideration of that benefit and to encourage others to make use of their powers." As to franchises, his argument is that the legislature does not interfere with the "sacred right of labor" by conferring them, because, in the first place, the employment made legal by them could not in the absence of legislative provisions be pursued by private individuals at all; and, in the second place, because "society obtains a consideration for the grant of these franchises in the investment of large amounts of capital in public improvements which are required for the development of the country and its resources."

We are unable to follow these distinctions. In the case of the patentee, as in the case of the railroad, the ostensible object of the grant is a public benefit; the immediate effect is an exclusive privilege. This is precisely the case of the slaughter-house company. We can see no essential distinction between such objects as the public health and the public wealth; still less do we follow the argument as to railroad and other like franchises, that as they confer rights to do what the legislature alone can authorize to be done, and which no private citizen has a right to do without such authority, they are, therefore, different from monopolies which interfere with previously established occupations. It is true that the public advantages claimed for railroads cannot be obtained without legislative interference; but it is equally true that the public advantages claimed as the result of concentrating an unhealthy business in a particular locality cannot be obtained without the same interference. It is true that legislative interference in the one case does not seem to interfere with any previously established pursuit; but this is only an apparent distinction. The introduction of railroads broke up the old lines of stage-coaches, just as the slaughter-house act in New Orleans interferes with the business of the butchers; and the old stage-coach required no act of the legislature to enable it to run, any more than butchers do to enable them to slaughter animals. So it may be said of a ferry franchise that it interferes with the "sacred right of labor" in exactly the same way. Did not the old-fashioned ferryman, who had enjoyed for a lifetime the sacred right of carrying passengers and freight across the stream on the banks of which he lived, regard as an odious monopoly the charter which took away from him his livelihood? We are driven to the conclusion that all these exclusive privileges belong to the same category; their ostensible object is a benefit to the public; their immediate effect the pecuniary emolument of private individuals.

But Judge Bradley says that the act of the Louisiana legislature, so far as it is a police regulation—in other words, so far as it inures to the public advantage—is valid, but that the claim that it was nothing more than a police regulation was "too bald for a moment's consideration." How this is shown does not appear. It may be that the judge means that the act is so grossly and palpably a "job," so obviously passed for the benefit of a ring, that the avowed object of the legislature is of no avail. There is a principle in the law of taxation which makes it necessary that a tax shall be laid for a public purpose; and any tax which is grossly and obviously laid for private benefit is set aside by the courts as unconstitutional. But the case must be such an extreme one as to appear on the face of it a swindle. It may be that Judge Bradley, having this principle in mind, thought an analogy might be drawn between the case of a tax and the case of a monopoly. But will any one say that the Louisiana act is on the face of it a swindle? The declared public object is at least a reasonable one. But this is a technical legal point with which we have nothing to do. Our object in the present article has been to show, as we have endeavored to do, that the reasoning of the court as to monopolies in general will apply to patents, railroads, and other private franchises, quite as well as to the privileges conferred upon the New Orleans Slaughter-House Company. If the decision is sustained, every moneyed corporation in the country is in danger of destruction. Whenever a court can be satisfied that the exclusive privilege granted by the State or the United States inures rather to private than to public advantage, the franchise will be set aside as in violation of the Fourteenth Amendment. Very few corporations will be able to stand this test. It seems hardly possible that the Supreme Court will sustain Judge Bradley; but, if they do, the consequences which we have endeavored to indicate appear not improbable.

MR. BOUTWELL AND THE CIVIL SERVICE.

One result of the recent trouble between Mr. Cox and the President, which, though perhaps not very important, is not wholly without value, is the sudden development of zeal on the part of divers high functionaries for the purity and efficiency of the civil service. There appears, if we may judge from what we hear and read, an anxiety pervading our political circles that the Government offices should be filled by "honest and competent men" which would have done credit to the best days of the Republic. They do not propose, of course, to adopt any such new-fangled tests of fitness as are proposed by Cox and Jenckes and Schurz; "the people" would not stand it. They have little contrivances of their own, which do the work without inconvenience to the party. The best and latest of these is that of Mr. Boutwell. This gentleman is opposed to civil service reform, as the term is generally used. He has again and again expressed his belief that the party could only be "run" by making the offices the reward of party service, and dismissal the penalty of "unsoundness," and, we may add, holds that opinion at present.

As soon as Mr. Cox took office, he began to introduce the system, not of examination only, but of competitive examination, into the Patent Office and Census Bureaux, but failed in obtaining the slightest sympathy or support from Mr. Boutwell, whose department contains a larger number of employees than any other, and was, therefore, the seat of the principal scandals connected with the office-seeking business. In fact, the latter has always avoided any sign of departure from the party traditions on this subject. There is an act of Congress, of 1853, which provided for the examination of Government clerks, and to which we referred a fortnight ago, but we believe it is correct to say that the examinations held under it were, down to 1869, rather practical jokes than tests of efficiency. In fact, the law was a dead-letter till June of that year, when an order was issued, signed by the Assistant Secretary of the Treasury, and directing the examinations to be held in a *bonâ-fide* manner; and this the Boston *Advertiser* published a week ago, as proof that the charge brought against Secretary Boutwell of indifference to civil service reform was unfounded. Enquiry, however, now elicits from the Treasury Department itself the confession, which we knew was sure to come, that the examinations held under this order were a farce, and remained a farce for a whole year. It was not till September last that any serious attempt was made to enforce the law, and this only under pressure of the growing public feeling on this subject and the example set by Mr. Cox in the Department of the Interior. The character of this attempt at reform is worth study. It consists of an order and an "examination schedule," which we reprint in full.

"Treasury Department, July 29, 1870.

"It is ordered that from and after this date the Board of Examiners provided for by the third section of the act of Congress, approved March 3, 1853, will be constituted as follows:

"The chief of the bureau to which the clerk is assigned, the chief clerk of the department, and E. B. Elliott, Esq., of the office of the Secretary of the Treasury.

"Examinations will be in writing, and must show the process by which the conclusions or solutions are reached. All the papers to be submitted with the report of the Board of Examiners, and filed with the appointment division of this office.

George S. Boutwell."

TREASURY DEPARTMENT EXAMINATION SCHEDULE.

Outline of a schedule to serve as a guide in the examination of applicants for clerkships in the Treasury Department, suggested by the permanent members of the Board of Examiners.

1. Name.
2. Residence.
3. Place and date of birth.
4. Elementary education—Mathematics, book-keeping, languages, etc.
5. Special acquaintance with business, art, or science.
6. Clerical experience generally.
7. Clerical experience (if any) in the service of the Government.
8. Example illustrating the class of accounts, computations, or work in which lately engaged.
9. Questions in notation.
10. Questions in numeration.
11. Questions in the addition, subtraction, multiplication, and division of whole numbers.
12. Questions in the addition, subtraction, multiplication, and division of fractions, decimal.
13. Questions in the addition, subtraction, multiplication, and division of fractions, common.
14. Questions in interest and discount, simple and compound.
15. Questions pertaining to the conversion of domestic and foreign currencies.
16. Questions pertaining to United States weights and measures, common.
17. Questions pertaining to United States weights and measures, metrical.
18. Questions pertaining to book-keeping.
19. Practical applications of the above.
20. Questions pertaining to grammar and orthography.
21. Geographical questions.
22. Historical questions.
23. Questions pertaining to government and law.
24. Correspondence.
25. Miscellaneous questions, tending either to further test familiarity with the subjects above specified, or to elicit acquaintance with other and more special branches.

☞ In the solution of numerical examples, it is desirable that the work be proved, and the process of solution and proof stated.

Washington, D. C., September, 1870.

It would be difficult, we suppose, to hit upon a better contrivance than the above for throwing dust in the public eyes. In the first place, let us remark, an "examination schedule" by itself means absolutely nothing. If Mr. Boutwell wants to convince people of his good faith in this matter, he must publish a batch of the examination papers—that is, of the questions drawn up and put under the schedule, and of the answers returned by the persons appointed. To judge whether this new process is or is not, like its predecessor, a farce, we want to know what the examining board asked the candidates, and what the candidates said in reply. Everything depends on this, and, after what has happened, it is absurd for Mr. Boutwell to ask the country to trust his simple assertion, or that of his subordinates, in this matter. The examination papers are, we presume, on file; let us have a sample of them along with the monthly accounts of the Treasury. Write two hundred and forty, is a question in notation. Add 2, 7, and 4; substract 20 from 40, and multiply 7 by 5, are questions in addition, subtraction, and multiplication. How many pints in a quart? is "a question pertaining to United States weights and measures." On what river does Washington stand? is "a geographical question." And, What year was Richmond taken? is "a historical question." In fact, an examination which is held in secret, and the results of which are not published, and which is conducted by men who are opposed to the principle of examinations altogether, is almost an insult to the public intelligence. No reform of the civil service can be anything but a mockery, a delusion, and a snare which (1) does not consist in the examination of candidates by persons unconnected with the departments, and, above all, unconnected with the party in power. The board must be thoroughly independent. The present board consists of Mr. Boutwell's appointees, whom he can dismiss at pleasure, and who are as much interested as he in "running the machine;" that is, in seeing that the useful party hacks get places, and that members of Congress obtain their fair quota of the offices for their hangers-on. (2) The examination must be open to every American citizen, high and low, rich and poor. Every man has a right to have a chance to enter the public service if he shows himself qualified. Neither Mr. Boutwell nor any Congressman has any right to shut him out. (3) It must, as a guarantee of fairness and of efficiency both, be *competitive* (that is, if there are many candidates for one place, the person who passes the best examination must be held entitled to the place), and it must be *public* (that is, be either conducted with open doors or have the results published); and (4) the tenure of office must either be during good behavior or for a fixed term. Anybody who rests satisfied with the device which Mr. Boutwell is now working at Washington may feel assured that he has given the Forneys and Chandlers the best possible cover for their operations.

ENGLAND.—MR. GLADSTONE ON THE WAR.

LONDON, Nov. 11, 1870.

WE are well into November; and no American travellers who may have visited London at this period can complain of not having seen the genuine fog of the British islands. The air is yellow, heavy, and thick; and our spirits are perhaps somewhat influenced by the simultaneous oppressiveness of the physical and the political atmosphere. We look into the street at noonday and see, instead of the sun, the feeble glimmering of gas-lamps; and, if we turn toward the political horizon, the prospect is not much more cheering. The war weighs like a nightmare upon our spirits, and I presume that in that respect at least you will sympathize with us. French refugees throng our streets; the neat white-capped *bonnes* are to be seen in our dismal London squares, wondering how John Bull supports the burden of existence; Regent Street, as presenting, I suppose, the nearest approach to a boulevard—nearest, but with an enormous interval—is full of foreigners, and one hears French spoken there almost as frequently as English. Judging from external appearances, one would say that our guests manage to keep up their spirits better than could be expected. Probably the less cheerful exiles do not exhibit themselves so freely; and, to say the truth, I doubt whether any large number of the poorer classes have really taken refuge on our shores. The relief societies seem to have some trouble in discovering a sufficient number of deserving objects for their benevolence, and it is amusing to observe how the English impostor is hastening to take advantage of the position. An old acquaintance in that line has just presented himself in a new dress. In former times his distresses were of the average type; he wanted five shillings to secure a permanent employment of great value; he had been reduced to the verge of starvation by a complicated series of terrible diseases; now, it seems that he had lately obtained an excellent situation in Paris, and was forced to fly from it by the advance of the Prussian armies. The ill-luck which induces this unfortunate being to place himself in the way of any catastrophe that is taking place at the time is truly lamentable. However, there is distress enough of a more genuine character, and it is painful to look forward to the winter and all it may bring.

Our attention has been lately fixed upon the praiseworthy effort of our Government to bring about an armistice. I call it praiseworthy, for it was, doubtless, undertaken from the very best of motives. But it is very hard to see what prospect of success it could ever have offered. It is plain enough that the French and Prussian Governments are still too far from taking the same view of the state of affairs to allow of anything short of a decided intervention producing the slightest effect; and it would have been as well to ascertain that their wishes were approximating before undertaking such a hopeless bit of peacemaking. The case was, I rather imagine, that our Government had been so vigorously entreated to do something, that they were willing to make some proposals, even though the too certain result should be to demonstrate the futility of any advances at the present moment. Some light is thrown upon their temper by a very remarkable article which recently appeared in the *Edinburgh*. That venerable periodical has of recent years been declining into a decided state of fogyism. What its circulation may have been, I have no means of knowing; but it led an innocent and inoffensive existence, curiously contrasting with its early vitality, and few people condescended to enquire of so sleepy an oracle. The present number, however, has gone through more than one edition, and excited a very lively sensation. The cause of this phenomenon is an article attributed to Mr. Gladstone, and called Germany, France, and England. The authorship has not been openly avowed, and I have even heard a rather evasive contradiction given to the report on apparently good authority. I think, however, that I may say positively that Mr. Gladstone is really the author. Besides private information, which appears to me to be above all doubt, the simple fact that the *Daily News* published the statement, and that other papers have criticised the article on assumption of its authenticity, without any contradiction having ever been published, is apparently conclusive. In such matters, silence gives consent; and, as far as internal evidence goes, there is no reason to doubt the accuracy of the report.

Mr. Gladstone, then—if, as I have no doubt, it is Mr. Gladstone—writes with his usual eloquence, and speaks with remarkable freedom upon the general questions involved. His statements are those which, I may say, are generally popular at the present moment amongst educated men. He throws the blame of the original quarrel upon France, and condemns the Emperor and the Ministers in no measured terms. Of the French policy which led to the war, he says that "for fault and folly taken together, it is almost without parallel in the history of nations." "The Mexican expedition," he says again, "and the whole scheme of ideas with which it was connected, constituted such a huge mass of blunders, like a huge agglomerated iceberg rising high to heaven and sinking far into the deep, that it might have been deemed incapable of adoption even by an ordinary human being if it had not captivated what was then considered the astuteness of the Emperor." The French people, indeed, cannot be relieved from responsibility; but the system of the Empire was detestable and criminal. On the other hand, the Prussians by no means escape from this energetic censor. The piety of the King and the policy of his Chancellor, "which, whatever else it may have been, was not pharisaical," come in for some sharp sneers. The plan of annexing Alsace and Lorraine is brutal and retrograde. If Count Bismarck has not been misrepresented, or does not misrepresent his countrymen, "Germany will yet have to prove her civilization by some other means than by boasting that six or six hundred letters have been written in good Sanskrit by the soldiers of her army to their friends at home." Turning from the contemplation of these wicked Continental races, Mr. Gladstone exclaims, "Happy England!" and becomes eloquent about "the streak of silver sea," which, though it does not cut us off "from the duties and the honors," yet does exempt us "partly from the dangers and wholly from the temptations which attend upon the local neighborhood of the Continental nations." He proceeds to give his view of our position and prospects, which are painted in the most glowing colors. We are freer than ever, he thinks, from all danger of invasion. We have finally abandoned the lust of conquest, which misleads all other nations. We may be blamed for our neutrality by hot-headed people, but we occupy a position of unequalled dignity. England is the "appropriate object of the general confidence, as the sole comparatively unsuspected power.. In every quarrel, in every difficulty, it is her aid that is most courted; it is by her agency that parties, if they seek a mediation, prefer to come together; it is under her leadership that neutrals must desire to move." Blessed are the peacemakers; and if we show ourselves worthy of our high calling, that is the position which we shall be called upon to occupy. A new law of nations, a new value for peace and respect for the independence of others, is gradually taking hold of the world. We, owing to our fortunate freedom from temptation, are in a position to take the lead in advancing this desirable consummation. We have already satisfied our colonies, pacified Ireland, withdrawn from "the feverish contest for influence," content to accept the moral power which comes from good character, and purpose to move forwards quickly and steadily in the path of progress. "The foremost among the nations will be that one which, by its conduct, shall gradually engender in the minds of others a fixed belief that it is just. In the competition for this prize, the bounty of Providence has given us a place of vantage, and nothing save our own fault or folly can wrest it from our grasp."

I need not dwell upon the value of the opinions thus expressed, of which your readers can form their own estimate without my help. I will merely say that with many of them I thoroughly agree, and, though I fear that the picture of England is just a little sanguine, I admit that the aspirations are generous, and really wish there was a better chance of their being fulfilled. But from another point of view, the manifesto is more remarkable. Mr. Gladstone rather shocked the nerves of steady old Constitutionalists by taking the stump in Lancashire—a proceeding held to be derogatory in a leading Minister of the Crown. "Interviewing" is a process which has not yet become entirely naturalized with us. But if Mr. Gladstone had desired to find some mode of expressing his views of European politics, he might surely, it is said, have found some more dignified method than that of contributing an anonymous article to a review. It is rather a singular position for a Prime Minister of England to be telling the world at large that the rulers of the two principal European powers are utter knaves and fools, that the King of Prussia is a hypocrite, Count Bismarck a cynical tyrant, the French Republican rulers a set of impracticable enthusiasts, whilst England alone stands mounted on a moral pedestal above the rest of Europe. This, at least, is rather an awkward expression of sentiment for one who is about to attempt a mediation between the victims of his satire. The restless and impulsive spirit which leads him to express himself in so unguarded a fashion explains the thoughtlessness with which he has rushed into the recent negotiations. Mr. Gladstone is incapable of judicious reticence, and has a great dislike to see any business going on without taking a more or less active part in it. He has many virtues, and a degree of talent which falls not far short of genius. But his nervous and eager temperament is always leading to superfluous displays of energy, whether in philosophizing about Homer or putting to rights the politics of Europe.

To swear by all Mr. Gladstone's doings is part of the creed of a large section of the Liberal party. With every respect for his intentions, for his remarkable talent and ceaseless energy, I have never been able to work myself up to the proper pitch of enthusiasm. He has not the simplicity and manliness of mind which one desires in a statesman of the first class. Still it is impossible not to admire him very sincerely, and I the more regret an act of indiscretion which will certainly do him little service in the general opinion. However, the meritorious nature of silence is little understood at this day, in spite of Mr. Carlyle and his preachings, and perhaps this performance will not be so much resented as his enemies desire. And perhaps, on the whole, Mr. Gladstone's expression of opinions will contrast pretty favorably with the recent utterances of his great rival—Mr. Disraeli. You have doubtless seen the recently published preface to our late premier's novels, and will have been much amused by his conception of the political and religious movements of the time. Mr. Gladstone has, at any rate, least of the charlatán, if he has also least originality.

THE MUNICIPAL REFORM IN RUSSIA.

St. Petersburg, Nov. 1.

The epoch of which Peter the Great was the exponent, though he neither began it nor ended it, was eminently one of centralization; the present of decentralization. Most of the reforms of the reign of the Emperor Alexander have been absolute reversals or entire remodifications of measures instituted by Peter, or at least conceived in his spirit. What was then judged useful and an incentive to progress has now become an obstacle and a hindrance. The ultra-Slavophilists assert that the reforms and innovations of Peter have kept Russia back instead of making it advance, because they were imposed from without, instead of being developed from the germs which already existed in the nation. It would be difficult to admit the truth of such a sweeping judgment, but certainly the reforms of Peter excited such a discontent and opposition among his people that many had to be soon given up, and some others which remained in force prevented many reforms which would naturally have come of themselves. The abolition of serfdom, which Peter did so much to strengthen, has brought in its wake the almost complete abolition of class distinctions, for the nobles have only two privileges left—freedom from recruiting and from the poll-tax—both of which will soon go, and the clerical caste was last year destroyed. The passport system, which gave rise to several rebellions, and is a great obstacle to the material progress of the country, has just been radically modified. While by the emancipation act the villages were allowed their old custom of free assemblies and an elective government, by the creation of provincial diets and by the judicial reform, the governors of the provinces were reduced from autocrats almost to clerks; and the same principle of representative assemblies was extended from the village to the province, embracing all classes. Slight as these privileges were, and they are unfortunately partly paralyzed by an imperfect publicity of proceedings, they are more than have been enjoyed since the parliament held by the first Romanoff. The cities alone were left out of these reforms, and remained entirely in the hands of the central power.

Novgorod, Pskov, and Viatka, and their colonies, were once free towns, and enjoyed the utmost liberty, even to excess, of popular government. The reign of Ivan the Terrible put an end at once to their freedom and their prosperity. Moscow, Vladimir, and the towns of the South had always been under the immediate eye and rule of the grand-dukes, and had borne the Tartar yoke, but even in Peter's time they had some remnants of self-government. It was Catharine the Second, however, who reduced all Russian towns to one model, in the hope of creating a middle or *bourgeois* class, which had almost entirely disappeared—all Russia being then divided into nobles and peasants. She founded numerous cities—and the flourishing state of most of them now does credit to her good judgment as to site—and introduced the "City Regulation," which has been, with little change, in force to the present day. Each of the six classes into which the city inhabitants (excluding nobles and serfs) were divided elected a member of the city council, and the mayor was appointed by the crown, till 1861. The council had extremely limited powers, and was entirely controlled by the governor. The Emperor Nicholas gave a more liberal government to St. Petersburg and Moscow, allowing the nobles and officials some share in the administration; and, four years ago, really liberal charters were granted to St. Petersburg, Moscow, and Odessa, with a council chosen by a system of double-election and an elective mayor, with large powers of self-government, and almost perfect freedom from outside pressure. The new institutions have worked so well, except in part in Odessa, where the representatives of the most numerous and lowest constituency have proved factious, demagogical, and corrupt, that a general law has just been signed by the Emperor, which confers self-government, on a still broader scale, on every city and town in European Russia, except the Western and the Baltic Provinces, for which special provisions are necessary. Much more than a year was spent in the preparation of this law, which was devised by a special commission of jurists and persons versed in municipal matters, under the presidency of Prince Urussoff, after conference with many delegations, and free and minute discussion in the press. The importance of the reform itself, and the curious experiments contained in it, will justify me, perhaps, in commenting on some of its chief features.

In general, the city government has the same powers and to the same extent as with you, except over the local police, which is an affair of the state, though the city is represented by delegates in the police board. No citizen can be taxed except as allowed by this law, by the law regulating the provincial diets, and by the corporative guilds, unless by a law of the Empire; and the city is bound to support the complaint of her citizen thus wronged. At the same time, the city is responsible for every excess of power or illegal act, and the governor is directed to lay all complaints before a special commission in each province, composed of the vice-governor, the treasurer, the district-attorney, the president of the justices of the peace, the president of the provincial regency, and the mayor of the chief city of the province—the last three being elected by the people, the first three appointed by the crown. If the city government does not collect the Imperial taxes—a duty imposed on it—the governor will collect them at the city's expense.

The city is governed by a city council (*duma*) and a city regency (*uprava*). Every inhabitant of the city is a voter, provided he is a Russian subject, twenty-five years old, has taxable real estate in the city, or is proprietor of a commercial or manufacturing establishment, with a merchant's certificate; or if he has lived in the city two years and has paid excise duty as a retail trader or clerk of the first class, and is not in arrears for taxes. An elector is deprived of his vote if he has been condemned or is under trial for a crime; if he has been expelled the public service for a crime or misdemeanor; if he is a fraudulent bankrupt, or is in bankruptcy with affairs still unsettled; or has been expelled from the clergy, the nobility, or some guild, for fault. The governor, the members of the special commissions for cities, and of the provincial regency and of the local police, cannot vote while they hold office. *Women*, absent voters, and persons of legal age (twenty-one) but not twenty-five, can vote by proxy, duly legalized. The proxy of a woman may be one of her relatives. Minors owning real estate have a vote in the persons of their guardians. Institutions, companies, societies, churches, and monasteries which own taxable real estate vote by their president; but no person can have more than two votes—one for himself and one as a proxy.

A list of voters is prepared, with the amount of taxes paid by each, and is then divided into three parts. Those paying the first third of the taxes form an electoral assembly, and elect one-third of the city council; those who pay the second third of the taxes elect another third of the council; and the rest elect the remainder. Elections are by an absolute majority of votes; the voting by ballot. Every elector is eligible to office, but service is not obligatory. The elections are held once in four years.

This complex system is intended to secure a vote for every person and institution interested in the welfare of the city, and for whose protection the city is instituted. It gives at the same time a preponderance of votes to a preponderance of wealth. How well it will work when reduced to practice remains to be seen. That economy in the administration of the city revenues and the minimum of taxation would follow seems almost certain. As a city government passes no general laws, a vote for the protection of the individual is by no means necessary. The imposition of a tax on lodgings and the admission of their hirers to vote—"household suffrage"—is to be considered by each city, and to be settled in a year by general law.

The number of members in the city council varies with the number of electors. Where the electors are three hundred or less, there are thirty in the council, and for every one hundred electors beyond that six members are added, till the number reaches seventy-two. The council is presided over by the mayor, and in certain affairs has a vote. As the city council represents the whole community, it acts in its name, and has full powers, among which is that of fixing the salaries of all city officers, and that of voting and revising the budgets. The council examines and takes action, on the initiative of the mayor or one of its members, on the proposition of the city regency or the government authorities, or on the demand or complaint of private persons. One-third of the members forms a quorum, and a simple majority passes a measure, except that the purchase or sale of real estate, action on loans or guarantees, conversion of service in kind (paving and cleaning are done at present) to a money-tax, and removals and impeachments, which require a two-thirds vote, and where half the members must be present.

The city regency or executive board corresponds to your elected or appointed city officers, and is, as it were, the cabinet of the mayor. The number of the members is fixed by the council, but there must be at least two besides the mayor, its president, though in very small towns the mayor has also the duties of the regency. It has the immediate charge of the executive administration of the city interests, and on its proposition the council can appoint commissions or individuals to take measures necessitated by extraordinary circumstances, or to have the immediate direction of certain branches of the city economy and administration, who need not be members of the council, but must have one of the members of the regency as president. The members of the regency have seats in the council, but not votes, unless members. The mayor, the regency, and the city secretary are elected by the council, and any elector can be chosen; but the mayor cannot be a Jew, and the secretary need not be an elector. The mayor holds office for four years, and the members of the regency go out half every two years. Substitutes are elected to fill their places in case of absence or disability. There are two or three other disabilities. Father and son, father-in-law and son-in law, and brothers, cannot be members of the regency at the same time; and ecclesiastics, judges, government attorneys, and officers of the treasury cannot hold a city office. The council appoints also all officers now appointed by the mayor or council, such as representatives in the police boards, and takes charge of whatever duties are now imposed on the city governments, the collection of Imperial taxes, the recruiting duties, etc.

The revenues of the city come from a tax on real estate, which cannot exceed ten per cent. of its income or one per cent. of its appraised value; various licenses for manufactures, trade, distilleries, etc., licenses for restaurants, hotels, etc.; a tax on hacks and carts, a tax on private horses and carriages, a tax on dogs; and a few excise duties of very slight importance, which have always been paid to the city. The tax on lodgings will probably be granted also, but no other tax of any kind can be laid without a special law of the Empire. Strict accounts must be kept and budgets regularly prepared, but the city expenditures are not subjected to the investigation of the Imperial control. It was strongly urged by one party to give the city government power to make loans and give guarantees to works of public utility, such as banks and railways; but this permission was, I think wisely, refused by the Government.

There is one blot on this liberal measure. No Hebrew can be mayor, and not more than one-third of the city council or of the regency can be non-Christians. In cities like Kazan and Orenburg, where at least half the population is Tartar, this seems hard; and there are many towns in the southwest where nine-tenths, or even more, of the population are Jews.

There is one peculiarity about Russian reforms. What the Government gives with one hand, it seems itching to take back with the other, there is so often some provision which hinders the measure from being perfectly liberal. So here. The necessity of the mayor's election being confirmed by the Government; the power given to the governor of general supervision of the city government, though he is unable to interfere, except when he can allege a contravention of law or of the charter; the right of the regency to disobey a command of the council which they believe to be illegal, and their reference of the dispute to the governor—all detract from the complete independence of the municipality. Granted, however, the necessity of the central government retaining some control, the establishment of the special board for cities in each province, composed half of elected, half of crown officers, seems the fairest and best way possible for settling the disputes of the two jurisdictions.

The reason of these hindrances can easily be seen. Here, for instance, are some sixty governors of provinces, who were formerly petty autocrats, and are now becoming in comparison almost clerks. Unless they are extraordinarily enlightened and patriotic men, they will dislike every attempt to limit their powers, and as they are in constant communication with the central government, they will show in their reports the faults and weak spots of all the new measures, and what they say will naturally have its influence. Another new reform, which is now being worked out in a commission, treats directly of the powers of the governors and of the administration in the provinces. It will be a sharp fight. Let us hope that it will end rightly, and that the provincial diets may set in earnest, as some have already begun, at the work of popular education, and then, when these new, self-governing institutions have taken root, we may expect the "crowning of the edifice" by a representative parliament and a responsible ministry, which will be the abdication of autocracy. When that will be depends doubtless in great measure on the action and fate of the new French Republic. There is always danger of reaction.

M. FAVARGER'S FRENCH READINGS.

THE conventional announcement, in the midst of a crowded salon, that "Mr. —— or Miss —— will now favor the company with a little reading," usually occasions a sensation more vivid and general than agreeable. The gentlemen whose happy stars have placed them at that instant near the door slip off to the smoking-room, while the young ladies, with a shrug of pettish resignation, beckon their especial cavaliers to a contiguous sofa behind the welcome shelter of curtains or a piano, and lighten the weary moments with a flirtation of glances if not of words. The feeling is natural enough, and does less discredit to our social culture than might at first appear. In such amateur efforts, the imprisoned spectator must usually resign himself to a choice—alliterative but aggravating—among prosiness, platitude, pretension; and may esteem himself happy if he is not bored with all these. Setting aside the consideration of the original and innate taste and feeling possessed by most parlor-readers, it is safe to say that not one in three has the technical training indispensable to their illustration. Good reading, quite as much as good acting, is a matter of delicate mechanism, and should be the result of thorough and, at least, quasi-professional drill in the technicalities of the art. But this, as a very cursory glance over the ranks of our amateurs will show, very few possess, and the judicious critic will hardly sit through an average parlor-reading without having his taste, if not his common sense, offended, and his nerves unkindly tried by a glaring lack of the simplest and most elementary principles of *technique*. The professional reader, on the other hand, is apt to sin in the opposite direction. Occupied as he has been with the details of his art, with inspiration and respiration, with whisper and *ore rotundo*, with accent and inflexion, he is sadly apt to present an instance of technicality run mad. His enthusiastic study of means and methods has led him unconsciously to exaggerate their importance, and, sinking the poet in the professor, he not unfrequently treats the company to a brilliant and elaborate but unrefreshing fantasia on his own lungs and larynx.

Even the best of readers is in a somewhat trying position. His efficiency is, in strictness, picturesque and dramatic, not intellectual. Were he working with the dry light of the pure understanding, nine-tenths of the spectators would prefer to take the book from his hands and retire to digest it at leisure. His appeal, like the actor's, is far less to their brains than to their sentiments, their passions, or their imaginations. But for this he lacks the actor's accessories. Scenery, music, costume, artificial light—all fade and dwindle to a little table, a handkerchief, a glass of water, and a pair of candles. Unaided by the varied personality and magnetic impulse of other actors, he must "in his time play many parts," he must be himself the be-all and the end-all of his mimic scene. Little or no freedom, even of motion and gesture, is allowed him, and constraint of position is usually added to his other limitations. Then the scrutiny to which he is subjected is embarrassing. His auditors have him at short focal range, both for eye and ear. When attentive—and what reader would wish them otherwise?—they lend him an attention which seems to be concentrated in inverse ratio to the size of the audience. Like Brutus, he finds

> "All his faults observed,
> Set in a note-book, learned and conned by rote."

In him an awkward movement or expression, harsh tone, or false inflexion, which in the more distracting atmosphere of the theatre might have escaped notice, is magnified under the microscopic examination of the parlor or music-room.

Add to this that even the willing listener is often haunted with an anxiety that he is to be bored, and, expecting it, can hardly forgive the reader for disappointing him. This curious form of uneasiness is apt to retard the hearer's pleasure or modify it, and not a few auditors at a really good reading, if they analyzed closely, would find mingling with their satisfaction a spice of resentment for having been interested as it were against their will.

Yet these entertainments have some marked advantages. The reading of a well-selected programme by a skilful artist may be, and often is, an occasion of very refined and profound enjoyment. Such an interpretation is to the more glaring representation of the theatre as a *predella* of Angelico or a cabinet gem by Frère to a piece of Michael Angelo or an altarpiece by Rubens. Undisturbed by the broad picturesqueness of the stage, the attention of the hearer is free to concentrate upon the more intellectual traits of the work—in grace of expression and subtle underlying chain of thought or feeling. The imagination and the emotions, too, may gain rather than lose by the close magnetic relation into which the reader is brought with his audience. Many a pathetic or passionate thrill of the voice or quiver of the feature, many a comical twinkle of the eye or significant twitch of the fingers, which would have been lost before the footlights, gets home to its mark, and will interest in the almost confidential relation of the reading circle.

To the careful student of belles-lettres, it is almost superfluous to remark that French literature offers an unsurpassed field for such entertainments. The subtle, almost impalpable, grace and wit of the best modern French work; the exquisite fitness and proportion of its treatment; and the singular electric energy and dramatic fire which pervade French literature, as it does, or did, French life and character—all these qualities render the works of their really able authors, whether dramatic or lyric, especially fit for the use under discussion. De Musset, Delavigne, Hugo, Béranger, Nodier, and a host of others, offer a field for the selection of a programme, or of many programmes, which, in this view, it might be hard to parallel in any other language. With the exception of Robert Browning, probably no poet on our shelves so combines the dramatic and emotional with lyric grace and picturesqueness as Béranger or Victor Hugo, as exemplified in the "Ballades" of the one or the "Orientales" of the other. Both of these brilliant poets, with others as good, have frequent and honored place in the programme of the professor whose name heads our article, and on whose admirable interpretations these few remarks are but a form of comment. The cultivated public stand greatly in his debt, not only for the enterprise which has led him to organize the course, but for the fire, grace, and humor of his elocution and *acting;* for what Frenchman could read without acting? For his taste and feeling he has, of course, Nature to thank; his uncommon technical skill comes from careful training at the Paris Conservatoire. That his readings should be widely known or enjoyed, no one in his senses expects. Spite of geologic eternities (all individual experiences being summed up), of boarding-house labor, of Noel and Chapsal, and Fleming and Tibbins, and Ollendorff—spite of all the oceans of tears shed and all the *peine forte et dure* suffered "for talking English in class hours"—the sad, inexplicable fact still remains that not one young person in five really understands, or heartily enjoys, the reading of poem, tale, or play in *real* French. The satire of our italics will be appreciated by those who, armed with a competent knowledge of that nondescript and utterly imaginary dialect yclept boarding-school French, have taken a plunge into the bewildering practicalities of the Boulevards or the Champs Elysées.

An old German proverb says, "As the old birds sing, so twitter the young;" but the saying does not admit of conversion. The faint Gallic twitter of the collegian or the belle just out rarely deepens and swells into the full song of mature knowledge, but more frequently, alas! in the course of business cares or home duties, dies away into the inaudible. And thus it happens that the appreciative little audience which looks forward with such pleasure to M. Favarger's Tuesday afternoons at the Union League theatre, is painfully select; but they are heartily obliged to him for all that.

Correspondence.

SIR HENRY STORKS AND HIS FEMALE ASSAILANTS.

To the Editor of the Nation:

Sir: It strikes me that a moral unsuspected by the writer lies in Mr. Webb's letter to you boasting that Sir Henry Storks lost his election at Colchester through the efforts of a lady who, no doubt as the emissary of her party, went down and plunged into the electioneering campaign against him because he was a supporter of the Contagious Diseases Act.

Sir Henry Storks, as Mr. Webb truly says, is no ordinary man. He is one of the ablest and most upright of the public servants of England; he has been the successful governor of more than one dependency in trying times; he combines in a singular degree humanity and liberality of sentiment with military force of character; and his appointment to the temporary governorship of Jamaica after the disturbances was welcomed by the friends of a humane policy. His capacity and experience as a military administrator are at the present time greatly needed in the House of Commons. But he, it seems, is deprived of his seat in Parliament, and the country of his services, because he will not submit to the dictation of a party of ladies on a special question about which they have worked themselves up into a state of wholly disproportionate excitement. I have not the slightest prepossession in favor of the special provisions of the Contagious Diseases Act; but every one who knows the British Parliament must know that if the Act can be shown by trustworthy evidence and rational arguments to be injurious, it will be readily repealed, and that the frenzies of crusading fanaticism are absurdly out of place.

It appears that the language of Sir Henry Storks, who is probably a greater master of things than of words, was infamously perverted by his opponents; and any one who is familiar with British constituencies of the Colchester type can well imagine what a tempest of prurient hypocrisy would be raised by this slanderous appeal. But no sane woman, however excited about the Contagious Diseases Act, can pretend to believe that the intentions of such a man as Sir Henry Storks in supporting the Act were otherwise than moral. No doubt he holds that, in questions relating to the prevention of disease and the alleviation of human suffering, the dictates of medical science are the dictates of morality. As a military man, he knows the ravages which disease made in the army before the adoption of sanitary precautions, and the extent to which hereditary maladies were transmitted to the children of the soldiers who married after passing the years of early manhood in garrison towns. His high character and his professional responsibility forbid him to suppress for electioneering purposes his convictions on a subject of so much importance to his profession.

The other principles and interests represented in the candidature of Sir Henry Storks were of course left entirely out of sight; nor, I presume, did the ladies pause to reflect that by procuring his rejection they were securing the election of a Tory, who will vote with his party for standing armies, which, whether the ladies will it or not, do universally and inevitably bring prostitution in their train. When we are acting on "principle," to consider the real tendencies of our actions is treason to the cause.

If the ladies personally engaged in this affair were eminent among their sex for talent and virtue, this only strengthens the moral to which their conduct points.

AN ENGLISHMAN.

November 26, 1870.

[Exactly; this last sentence expresses what is passing in the minds of thousands who are watching the performances of the ladies who have entered the political arena. We let Mr. Webb's letter pass, too, without recalling Mrs. Josephine Butler's outrageous attack on a gentleman of high standing, at the last meeting of the British Social Science Association, accusing him of indecency because he had visited hospitals of a certain class in Algeria. He was absent when the charge was made; but went into the room in which she had performed this exploit, and pointed out to her the impropriety of her conduct, and informed her, what she apparently did not know, and had not taken the trouble to find out, that he was a physician of thirty years' standing, and had visited the hospitals for scientific purposes. The reproof and exposure, however, did not elicit from her one word of apology or atonement of any kind. It may be said that men do these things to each other; but then, men are still able to find in their homes the society of those who do not do them, and who, in having neither lot nor part in them, seem to do at least as much to "purify and elevate politics" as the new female politicians have given us any reason thus far to expect from female suffrage. And, as our correspondent says, seeing what these distinguished ladies who are now on the stump are capable of, people begin to ask what the state of things will be when the female Tweeds, Sweenys, and Fisks begin to come to the surface and "manage" things.—ED. NATION.]

REAL UNIVERSAL SUFFRAGE AT LAST.

TO THE EDITOR OF THE NATION:

SIR: When in my last letter I intimated an intention of not again trespassing on your columns for the present, I little expected so soon to have an occasion to revise my decision. The reformer is, however, abroad, and the flippant article entitled "The Feud in the Woman's Rights Camp" in your last issue calls in my mind for an antidote. It shall be no fault of mine if the readers of the *Nation* are wholly mystified as to the best results of our most advanced thought. One point, and one point only, has for some time now troubled the advocates of female suffrage. It has been evident to us that the posture of political affairs was rapidly passing from bad to worse. That this was due to the vicious limitations confining the ballot to one sex only was indisputable; for the stream will always rise to a level with its source, and if it fails to rise high it simply proves that the source is low. The enfranchisement of women promised much, but, as hitherto proposed, left much to be desired. To women, we believe, we must look for those pure, elevating, unimpassioned influences which shall lift politics out of the slums in which men have dragged them. Such grave questions as temperance, "the social evil," divorce, and that "general cussidness," if I may use the expression, which now make jails, reformatories, and wars necessary or periodical, can only be vigorously dealt with through the introduction of women. Though this is or soon will be universally conceded, yet it was difficult to see how the suffrage as hitherto demanded would secure the desired reforms. To put the result beyond a doubt, a female preponderance seemed necessary—the women must, if necessary, be able to vote down the men.

I am rejoiced to see at last that even this final difficulty is solved. I need not add that this solution came from a woman; the clear, calm, mental vision of the sex at a glance saw that which the coarser masculine intellect had puzzled over in vain. In her speech, replete with mystic wisdom of which Emerson must be proud, at the Women's Peace Meeting in Boston on the 25th inst.—the day after your article appeared, and, as it were, in dignified response to it—Mrs. Julia Ward Howe made this notable contribution to the science of politics: "Let the men vote and let the women vote, and let every child a woman has given to the state give her an additional vote." Much as I admired Mrs. Howe, I confess I was not prepared for the nice knowledge of legal principles indicated by this remarkable utterance. That by the instinct of intuitive genius she should solve the whole suffrage question need surprise no one familiar with her mind; that she should do it in absolute accordance with legal maxims is astonishing. All lawyers are constantly citing the rule, *partus sequitur ventrem*. Why, I ask, was it reserved for a woman to make this nice application of it? This principle conceded, and the suffrage question may be considered settled; the ballot will belong to all, even to the babe unborn.

This simple, quiet solution of a question which has long perplexed men called profound opens a sure way to those reforms which wholly depend on female supremacy. "Let the men vote"—can we in justice demand more?—"and let the women vote"—can we in justice grant less?—and then *partus sequitur ventrem*—our own rule, mark you!—all children under age cast their ballots through their mothers. Others more familiar with the subject than I may correct me, but I venture to hazard the assertion that this application of a familiar principle is no less novel than startling, and that Mrs. Howe may now claim to be recorded among the rare minds who have contributed ideas absolutely new to political science. After this, can even you assert that women have not the legal instinct?

A SENTIMENTALIST.

BOSTON, Nov. 27, 1870.

[We clearly foreshadowed this reform some time ago in an article on "Baby Suffrage," which "A Sentimentalist" evidently wishes people to believe he has not seen, and in which we boldly claimed the suffrage for young children, on the grounds with which the Woman Suffrage controversy has made the world so familiar. Of course, our demand was received with jeers and abuse; but this did not move us. We knew we had sown the seed, and we now begin to see the fruit. The proposal of the women to have the children counted in the basis of representation, and have votes cast for them by their mammas, as "trustees," just as the slaveholders were said to be "trustees" for the negroes, and the English oligarchs for the unenfranchised masses, and as the male voters for the women, is but the first step in a movement which will eventually put the ballot where it belongs, in the child's own hands, and then we shall have an end to infanticide, and, better than all, a final solution of the corporal-punishment question, the proper settlement of which can never be expected from adult parents and school-trustees. The world is sick of trusts and trustees; they are both mediæval devices in aid of human bondage. In the new era nobody will "trust" anybody else; everybody will paddle his own canoe, take care of No. 1, and carry his property about with him on his person. The first step toward this is the abolition of the present degrading dependence of babies on their weak and tyrannical mothers and nurses.—ED. NATION.]

Notes.

LITERARY.

MESSRS. SHELDON & CO. will shortly republish Victor Hugo's "Napoleon the Little," as being a prophecy worth reading now. They have also in press a selection of the best minor poems in the English language, entitled "Our Poetical Favorites," by Professor A. C. Kendrick, of Rochester University; and a new story by Mrs. Jane G. Austin: "The Shadow of Moloch Mountain."——Messrs. Roberts Brothers announce for next week "Brevia: Short Essays and Aphorisms," by Arthur Helps.——G. W. Carleton will publish immediately a posthumous work on Italy by Mrs. Anna Cora Ritchie, entitled "Italian Life and Legends," with illustrations of Italian scenery.

—Messrs. Hurd & Houghton have completed the American edition of that truly grand performance, Dr. William Smith's "Dictionary of the Bible, comprising its Antiquities, Biography, Geography, and Natural History;" and, now that the task is finished, we cannot refrain from repeating the eulogy with which, three years ago, we greeted the incipient enterprise. The American editors, Prof. Hackett and Dr. Ezra Abbot, have deserved well of the literary world and the Bible-studying public in general by the excellent revision they have bestowed upon the work, as well as by the numerous additions with which they have enhanced its value. As it now is, it may justly be said to represent the best acknowledged biblical scholarship of both England and America—though certainly not the most advanced criticism of the age—and in technical execution to rival the finest publications of a similar character. Among the original contributors—about threescore and ten—we find Dean Alford, Canon Blakesley, Emanuel Deutsch, Bishop Ellicott, Farrar, Bayard, Lightfoot, Oppert, E. H. Plumptre, J. L. Porter, George Rawlinson, Dean Stanley, and a number of other distinguished writers, to whom the list of writers for the American edition adds the names of Prof. Bartlett, Dr. Conant, Prof. Day, Prof. Fisher, Prof. Gardiner, etc. The latter edition consists of four volumes, of about nine hundred closely printed octavo pages each. It is still sold by subscription.

—A heavy loss has befallen Nassau Street in the death on Sunday of Mr. William Gowans, who for forty years had been *par excellence* the antiquarian bookseller and publisher of New York. He was born in the parish of Lismahagow, county of Lanark, Scotland, on the 29th of March, 1805, and removed with his parents to this country in June, 1821, landing at Philadelphia in July of that year, and immediately removing with them to Crawford County, Indiana. In September, 1830, he commenced business in this city as a bookseller at No. 121 Chatham Street, near Pearl. From this small beginning he became at last the leading antiquarian bookseller in the country, with a bibliographical knowledge unsurpassed, and with a sound and sure taste in publishing. His first venture was Plato's "Phædon," in 1833. His last, to our knowledge, was the "Bibliotheca Americana," which a year ago had reached its fifth volume with the reprint of Alsop's "Character of the Province of Maryland," noticed at the time in the *Nation*. Mr. Gowans was naturally of a very amiable and kindly disposition, and if he at times had the appearance of crabbedness it was due partly to his native frankness and partly, no doubt, to a constitutional headache which never forsook him. His death will excite universal regret in literary circles.

—We have already mentioned the fact that Mr. John Langdon Sibley, the chief librarian at Harvard College, has in preparation a biographical record of the first two hundred and twenty-five men who were graduated at Cambridge. The work is, indeed, in the printer's hand, and will appear as soon as there shall be obtained the number of subscribers requisite to cover the expense of publication. It will be sold to subscribers only, will not be stereotyped, will be excellent as a specimen of typography, and will for these reasons, apart from its biographical and historical value, be very well worth the attention of even such book-buyers as may not take in it the interest which it will have for those whose kinsmen by blood, or by the affinity of having a common Alma Mater, are commemorated in its pages. Its historical and biographical value will, however, be not inconsiderable, Mr. Sibley being already known as a worker in the field of Massachusetts local history; and his painstaking labor in the making of this book having covered a long term of years, and been expended in careful and minute research, some of the matter which he has discovered is curious and interesting, but most of what he has to present is, of course, material of the sort which, however it may serve as the basis of the pictorial writings in which some future romancer or historian or essayist shall reconstruct colonial history, is in itself certainly not picturesque. How valuable it is the best pictorial writer best knows. "I myself," says, in substance, Arthur Clough, in speaking of a new volume of Macaulay's "History," "have as yet discovered but one blunder, and that a small one, but it is characteristic. 'The oaks of Magdalen,' he says. They are not oaks at all, they are elms; but the temptation to be *particular* was irresistible." To be particular, and to be at the same time exactly truthful, it is the business of such books as this of Mr. Sibley's to make possible—books unwisely scoffed at by many who should know better, and by some who do know better. We had not intended to say so much about the work in question; no harm is done, however, if our mention of it shall help to bring up the list of subscribers, Harvard men or others, to the necessary number. Some sixty or more new names are, we believe, wanted, and, of course, as soon as may be. We may add that the volume will be an octavo, and the paper will be of the best quality, the same as that of Upham's "Witchcraft," while the work will be done at the press of Welch & Bigelow.

—The mention of this press reminds us of a little story, as Mr. Lincoln used to say. It is a little story with a moral; and it was invented for the benefit of a "certain University, whose name begins with an H and ends with a D," and which is situated at "Charlesbridge;" and it first saw the light in the columns of a certain Boston evening paper, the name of which we think we shall not give. The fable of which we speak asserts that the university at "Charlesbridge" for many years employed as its printer a gentleman who was very fond of the University. So long had he done its printing that he had acquired by prescription a right to be so employed; he had honored the institution by naming his press after it; he had come to love it so much that he had put it down in his will for a large sum of money, and would, says the story-teller, have very likely, if he had been asked to do so, printed the college catalogue for nothing, rather than see it go elsewhere. The university, however, in a recent fit of small economy, forgets the honor this gentleman had done it by naming his press after it, and, being ignorant that it is down in his will for a large sum of money, overrides his prescriptive right, and gives its printing to another printer. A lawyer is now sent for, the will in question is altered, the bequest to the university being stricken out, and the upshot of the matter is that the foolish institution of learning loses twenty-five thousand dollars in cash, and will probably, this year, pay more money for a very poor catalogue than it paid before for an admirable catalogue. Pretty obviously one would say, all this is nobody's business but the printer's and the university authorities'; and it is as decidedly his and their private business as the tailor's bills of those gentlemen. But, now that it is made matter of public comment, a remark or two is here in place. It is needless to point out the cleverness of the argument that the college should have been influenced by its knowledge of the bequest of which *it was ignorant*, and of which in this ignorance it is said to have deprived itself. This peculiar sort of cleverness is common to the whole class of writers and talkers who devote themselves to the making or spreading of such tales as the one we have summarized; the snake described by mediæval naturalists as the amphisbæna—which is provided with a venomous head at each extremity, each of which is capable of despatching the other—might very well be taken as their crest by the entire tribe of them. A true but unpractised brother of the guild was he of whom it is somewhere related that he once wrote to his friend a scurrilous "anonymous letter," denouncing the friend's intended wife—a lady who had been a cook, he said, and was given to intemperance—and then inadvertently signed his full name to it. Happily it was in duelling days, and the other gentleman fought him, and prevailed against him, and stopped *his* writing of anonymous letters. Our fabulist's prediction as to the probable quality of the new printer's workmanship is another pleasant and characteristic stroke, this contingent belying and detracting being another stick with which all of this flock are tarred. Doubtless the probability is that the university has given reasonable attention to securing the kind of work it wants, and at the price it thought good. As for the prescriptive right above-mentioned we do not see how it could be established. There would seem to be no reason why So-and-so should do my work at rates, say ten per cent. or two per cent. or twenty per cent. higher than those at which another man will do the same work equally well. Universities especially, which, in this country at least, are all very poor, are bound to make their money go as far as they possibly can. As for the honor and benefit conferred upon the "Charlesbridge" university by the naming of the press, we should say that any member of the university who should maintain that there was honor and benefit conferred upon as well as by the printing establishment, might have good hope of making out his case. But it was not our purpose, nor have we the necessary knowledge, to go into the details of the story. It is no affair of ours; and it comes without proofs of its statements, and comes in a way so suspiciously like a malicious invention or perversion of facts, that it should be disregarded both by the friends of the highly respectable man, now dead, after an honorable life of hard work, who is made to appear in it, and by the friends of the university. Our purpose was to ask for renewed attention to one of the disgraces of journalism.

—In view of such disgraces, it might be worth while to introduce into this country the use of the postal cards which have been found so serviceable to the French and German soldiers, and which the English, too, have adopted. Possibly they might do something towards abolishing the scurrilous editor, who certainly flourishes about as rankly now as ever before in the history of our journalism, though we suppose he is more clearly known for a rascal and a pest than formerly he was, and suppose, too, that the proportion of the decent men to the indecent in journalism is now greater than ever. The "high-toned" editor of the good old times was pretty often an unscrupulous party hack; and pretty generally he was an ill-informed old braggart, too, whose "eloquent editorials" would have had not much left in them (except some traditionary bits of good sense from "The Federalist" and the Constitution), if, for instance, they had all been treated as Webster treated President Harrison's annual message. He had just done a good morning's work, he told a friend of his; he had been with the President, and had succeeded in getting we forget how many "Roman proconsuls out of the message," and much other similar Greek and Roman matter. To-day there is room for improvement, of course; but we imagine that there is more sense, wit, knowledge, and honesty in our journals than even a gentleman of the old school would be able to discover in files of the journals of the immortal Mr. Daniel of Richmond, or General Jackson's Mr. Blair, or Mr. Prentiss. Our existing scurrilous papers are, however, villanously bad, no doubt; for impudent handling of the affairs of private life, for malicious attacks on private character, for political dishonesty and greed, for cynical devotion to money-getting, for downright hard lying, for their indifference to common decency, not to say their preference for sensational indecency, for their frivolous personalities, we suppose they have never been excelled. The famous "stout oak stick" on which Dr. Johnson immediately laid out a sixpence when he had information that it was Mr. Sam Foote's intention to portray him at one of that gentleman's divertisements, is really about the only instrument of criticism which it is proper to employ in commenting on the performances of certain gentlemen of our daily and weekly press. The doctor never otherwise so well earned his title of the Great Moralist—if indeed the title was not purchased there and then when the stick changed hands. Some stories that we hear are false, or it is a fact that something recently very like this Johnsonian method of criticism has been efficaciously applied to certain editors who might be mentioned.

—Our notion in regard to the postal cards was suggested by what is told of the English use of them. They are meant to be used for the transmission of short messages, as to which the sender and the receiver are indifferent whether or not all the world reads them. It has been found, however, in these first days of the trial of them, that they furnish what seems to many people an irresistible temptation to send to objects of their displeasure opprobrious and insulting messages. For instance, a lady desirous of fomenting domestic discord may write a postal card to the husband of the family whose peace it is desired to disturb, and cause it to be delivered when he is absent and his wife is not. This card, the assumption is, the wife will of course read, and that the consequence will be "incompatibility" of greater or less duration and savageness. Or a discontented tradesman may successfully impart to all a man's servants that he thinks he "has waited about long enough," with the result of bringing upon the debtor the contumelious regards of the kitchen girl who receives the missive, and also of importing deeper bitterness into the remarks of the cook when she is discharged for peculation. So of all other weaknesses and crimes. They may, by means of the postal card system, be so imputed to a man that some members at least, and very likely all, of the circle immediately about him, and whose good opinion is of most importance to him, shall distinctly know that he stands so indicted. It is in this particular that the postal card writer has the advantage over the writer for scurrilous newspapers. The latter cannot be sure that a man's wife, for example, will read the next morning's—*National Intelligencer*, let us say for safety's sake. He may fling as much mud as his talents permit, and with the best will, and yet it may all fall innocuous. For purposes of general defamation of public persons the newspaper would no doubt still be used; but we may fancy that some of the libellers of private men would feel it better to employ their abilities in the devising of postal card messages than in putting their rascality into print. Another advantage would be that there would probably be some, though a small, opportunity for retaliation upon the libeller; slender and delicate persons might properly prefer the retaliatory postal card to the stout oak stick above-mentioned or the revolver—instruments that now afford nearly the only resource open to the public.

—The Proceedings of the Massachusetts Historical Society for June to September, inclusive, contain a clear and interesting account by the President, Hon. Robert C. Winthrop, of a singular suit which the Legislature of Massachusetts has directed the Attorney-General to bring against the Society, to recover certain original documents known as "The Hutchinson Papers." It appears from this statement that in 1819 and 1820 the Secretary of the Commonwealth presented the Society with sundry letters and papers "saved," as he described them to the Legislature in the following year, "from the riot at Gov. Hutchinson's house—some of them of a private nature, and some of them public documents collected by him probably as materials for his History of Massachusetts and a volume of State Papers which he had published." These he did not regard "as belonging to the Government, or as any part of the records of the Commonwealth, or ancient colony or province," and accordingly, with the then Governor's permission, he deposited a part of them, "valuable chiefly for their antiquity," with the Historical Society, as already mentioned. In 1846, and again in 1847, Dr. Palfrey, the historian, then Secretary, sought to reclaim the documents for the Commonwealth, but the Society adopted the report of a special committee that the State had not the shadow of a claim to them, and that the statute of limitations might properly be invoked against any such claim. In 1867, the Legislature reopened the controversy, and has ended by ordering a prosecution of the Society. It seems quite unlikely that the court should dispossess the defendants, who mean to contest. They will do so for the principle involved rather than for the sake of keeping the letters, which have either been copied or printed, and are no longer indispensable.

—Very interesting memorial notices of the late Hon. John P. Kennedy and Rev. Dr. N. L. Frothingham are contained in these same Proceedings. A letter from Rev. R. C. Waterston, written from San Francisco, mentions a national service of the late Mr. Stanton which is far from being generally known. One may now examine in San Francisco a collection of about one thousand volumes, mostly manuscript, constituting the body of Spanish and Mexican archives which fell into the hands of the United States Government when it took possession of California. They were concealed at first at Los Angeles, but finally brought to Monterey. In 1851, Government placed them in charge of the surveyor-general—a very proper disposition, since six hundred of the volumes relate to grants of land. "In 1858," continues Mr. Waterston, "the Hon. Edwin M. Stanton came officially to this place, and found the papers disarranged, and more than one-half (now in this collection) were still in other parts of the country. By his influence and under his oversight, they were brought together, systematically arranged, and substantially bound." In addition to royal decrees, official orders and correspondence of the Mexican Viceroys, correspondence of the Governors of the Province from 1775 to 1844, records and correspondence relating to missions, presidios, and pueblos, and civil, military, ecclesiastical, legislative, and judicial records, there are miscellaneous records of current domestic history, and, what is especially valuable, "correspondence by navigators of different nations, in as many as ten languages—documents dating as far back as 1767," and containing a history of the coast from Cape Horn to Columbia River, for a hundred years. "Here are manuscripts relating to Vancouver (dated 1795); also to the celebrated voyage of Captain Cook, together with accounts of Prussian admirals, English captains, and French explorers."

—Among the clever pictures which the Italian correspondent referred to a fortnight ago gives of Paris under siege, is one of the club called the "Folies-Bergères," which, he says, discussed for an hour one night the question whether, seeing that the Prussians impressed the peasants to work on their fortifications, the Prussian prisoners should, in return, be made to work on the defences of the city. The generosity of the French character and republican fraternity made the negative prevail; and it was very well so, inasmuch as at that date (September 25) there were no Prussian prisoners in Paris. The same club in its debates was in the habit of referring to the provinces as if they were Patagonia, and their inhabitants as if they were South Sea savages—ignorant, stupid, imbruted, destitute of patriotism. All this, in hearing of the *moblots* or Gardes Mobiles from the same provinces. How to "civilize" these wretched inhabitants of France? "Persuade them," says one, "that their interest requires them to rise *en masse*, or else the Prussians will burn their houses and drive off their cattle." "Not so," says another; "we must go among them with an iron hand and unlimited powers, inspire them with fear, and compel them to be republicans, and obey Paris." The club does a more sensible thing when it asks *Figaro* by what means it obtained its pretended report (made, of course, out of whole cloth) of a council of war at the Prussian headquarters, what it paid for it, and how the editor manages to keep up direct communication with the enemy. Quite different is the club at the Théâtre Porte St. Martin, whose leading spirits and orators are Yung and Ratisbonne, of the *Débats*, Pressensé, and Cocquerel—a club which, if times were not changed, might seem to revive that of the Girondists, especially as it is one of the few at which one may address his audience as "Messieurs" without being hissed. Crowds attend, and an admission fee of twenty-five centimes is collected. The correspondent tells of the "guardians of the peace" whom Kératry substituted for the gendarmes, taking away their arms, and disguising them as much as possible. He made them shave their moustaches and imperials, and wear their hair combed down over their foreheads; from this circumstance, and because of the great hood which they wore on their coats, the populace dubbed them capuchins. They were instructed to walk three by three, soberly, and with downcast eyes. The result was that they had to be saved by the National Guard from the attacks of malefactors. By night one meets the *guetteurs de nuit*—five men, carrying a lanthorn on a pole, and charged to look out against fires—the watchmen of the Middle Ages.

—As for news, says this correspondent, in his diary for October 23, the eagerness for it is so great that when German newspapers fall into the hands of the Parisians, they are immediately reproduced, and, to add to their value, are imitated in form and make-up. Such a paper, found on the body of some Prussian victim of a sortie or reconnoissance, is carried as a prize to the office of some one of the Paris journals, which makes a great parade in announcing it. English papers excite a still greater sensation. On one memorable occasion, at Bagneux, a cutlet was found wrapped in a piece of the *Morgen-Post*—a double treat (*due regali in uno*). Book literature has not perished utterly, for Victor Hugo had printed the first French edition of his "Châtiments," preceded by a beautiful poem hitherto unpublished, entitled "Le Retour." The profits were destined to swell the subscriptions for cannon. The siège has seemed, too, a good opportunity in which to bring out of its obscurity the statue of Voltaire, and set it in a more commanding position—in that previously occupied by the statue of Eugène Beauharnais, in the *Place* formerly of the same name, but henceforth to be called, along with the boulevard, after the new incumbent. With so much more serious business clamoring for the best energies of every citizen, this renaming of streets, tearing down of odious insignia, and casting and melting of statues, in which Paris has been indulging since the 4th of September, is one of the most striking evidences of incapacity to face the situation. The logic of it would seem to be that the Republic could not be carried on in sight, say, of the *Avenue de l'Impêratrice*, or that if *Boulevard Haussmann* becomes *Boulevard Victor Hugo* the Republic will be assured—and Paris impregnable.

HARTT'S BRAZIL.*

IN this volume, of over 600 pages, we have one of the results of that expedition to Brazil which, by the generosity of Mr. Nathaniel Thayer, of Boston, was undertaken by Prof. Louis Agassiz and his companions in 1865-66. The director of the expedition has already in his pleasant narrative given us a general account of the journey and many of its results, but it was reserved for future publications to give the completed studies of the various branches of natural history whose investigation was included in the labors of the party. Fortunately for science, the task of thus investigating the geology and physical geography of Brazil was by Prof. Agassiz assigned to his companion and former pupil, Mr. Charles Frederick Hartt, now professor of these sciences at Cornell University, who, to prepare himself more fully for his work, returned to Brazil in 1867, and there spent several months. The results of his completed studies are given in the volume before us. The author has, as he tells us, examined more or less critically the works of the principal investigators who had preceded him in this field, so that his book, instead of being a simple report of Prof. Hartt's own observations, has grown into a general work, "in which have been incorporated the best results of others who have written on the geology and physical geography of Brazil." For this critical labor, and for the numerous citations and references showing the extent of our author's acquaintance with the literature of his subject, the student cannot be too grateful, the more so as many of the works cited are rare.

It is no easy task, in the short space of our columns, to give an adequate notion of the varied and important information with which this work is filled; but we propose to call attention to some of the points which have specially attracted us in the perusal of it. As regards the name of the country, which is that of a red dye-wood, known to Europeans before the discovery of this continent, and then brought from the East Indies, our author is apparently in doubt both as to the etymology of the word and the reason for applying it to the eastern coast of South America. A reference to Webster's Dictionary, however, gives a seemingly satisfactory solution of the double problem. We are there told that the name of Brazil, from the Portuguese *braza*, a glowing coal or fire, given to this bright, and then highly prized, red dye-wood, was by King Emanuel applied to this newly-discovered land because it abounded in what, under the name of Brazil-wood, is still an object of commerce from that country.

For the better understanding of the book a photo-lithographed sketch-map, on a considerable scale, compiled by Prof. Hartt from the best sources, is prefixed to the volume. The data for an accurate geographical delineation of the country are still wanting. Several small maps and sections and numerous wood-engravings, chiefly from drawings by Prof. Hartt, serve to illustrate the work; many of them are of considerable artistic merit. Our author takes up, one after another, the description of the several provinces to which his studies extended, and gives details of their geological character, including notes on the altitude of the rocks, their mineralogy and their lithology; while, in the case of the fossiliferous strata, their organic remains are carefully noted, and in many cases descriptions of new species are given, constituting important contributions to palæontology. The studies in the recent zoölogy of Brazil, which are scattered throughout this book, are also very valuable, and have been furnished partly by the author himself and in part by several American naturalists, whose aid is acknowledged in the preface, among them Messrs. Marsh, Hyatt, and Verrill. Prof. Agassiz, we regret to learn, has by illness been prevented from giving with this volume his descriptions of the great collections of fishes made during the expedition. The botany has not been neglected, and lists of the most characteristic and valuable plants are given in describing the various regions.

The geographical features of the country are described at length, and our author, inspired by the beauties of the natural scenery, sometimes forgets his concise and scientific style, and records his impressions in language which betrays the poet. Of the view from the summit of the Corcovado, near Rio, he says: "If the geologist has any soul, any love for the beautiful, there is no scene which, with all his cold analysis of topographical and geological elements, is more likely to impress him as an *artist's* work." This is followed by a fine piece of description, which, did space permit, we would gladly copy (pages 11 and 12). Nor are economic considerations overlooked; we have valuable information as regards soil, timber, and the cultivation of the most important crops, while the coal-mines of the southern provinces are described in much detail, and shown to be of great richness. In chapter xviii. will be found a careful account of the gold mines of the empire, considered both from a geological and an economic point of view.

To this last chapter succeeds a summary of the results to which our author has arrived with regard to the geology of Brazil. From the facts observed by himself, and by those who have preceded him in the same field, he has been enabled to give a general notion of the geognostical structure of the country, and to establish certain very instructive comparisons between it and the eastern parts of North America. We can only here call attention to two or three points of interest.

The weathering, or the softening and disintegration of hard crystalline rocks under the influence of the elements is well known to observers as a process which goes on in some regions with great rapidity. In our latitude, however, it is very slow, and the granite-like rocks of the Northern United States, where protected by a thin layer of soil, still bear uneffaced on their surfaces the ice-markings of the glacial period; while even the naked summits of the White Hills, after ages of exposure to the changes of the seasons, are but very slightly and superficially disintegrated. As we go southward, however, these conditions are greatly changed; in our Southern States the crystalline stratified rocks are found to be softened and altered to such depths from the surface as to surprise Northern geologists, and this condition of things is still more marked in parts of Brazil. In the province of Rio de Janeiro, the great mountain belt of the Serro do Mar consists of a crystalline gneiss, often granitic, and probably, as supposed by Williamson and by Hartt, of Laurentian age—that is to say, belonging to the same system of rocks as the Highlands of the Hudson. Beneath a layer of unstratified drift and gravel, which generally mantles around these hills in the province of Rio, the gneiss is found to be softened and decomposed to depths of from a few inches to one hundred feet. The feldspar has been turned into clay from the loss of a part of its constituents by solution, yet the crumbling products of decay still retain their original positions, as shown by the lines of stratification and by the intersecting veins of quartz. The causes which have produced this singular alteration of the rocks have been a subject of much speculation. Darwin, who studied the phenomenon in Brazil, supposed the change to have taken place beneath the sea—a conclusion which to the chemist is scarcely admissible. There is no doubt that the view advocated by Prof. Hartt, and by most chemical geologists, is in the main the true one, and that the process of alteration is dependent upon the action of warm rain-waters holding in solution, besides carbonic acid from the air, nitrate of ammonia, and perhaps nitric acid, which are frequent products of thunder-showers in tropical regions. Prof. Hartt, moreover, suggests that the organic matters, more or less acid in their nature, resulting from the decay of vegetation, may have aided the solvent action of the waters, and notes that this remarkable decomposition has only taken place in regions anciently or at present covered with forest. Inasmuch, however, as it is only in rainy districts which support an abundant vegetation, it would not seem by this relation alone to be established that the products of vegetable decay were in any way instrumental in effecting the alteration of the rocks, although the suggestion has chemical considerations in its favor. In any view, this softening of the rocks is a subject upon which we look for further light. It is well known that certain granitic rocks, even in England, are subject to this change; while others, apparently similar, have great power of resistance. In the present state of our knowledge, there is something mysterious in this softening of hard felspathic rocks by a process which is, to a certain extent, analogous with the mouldering of wood, and is not to be confounded with the mechanical crumbling down of certain brittle rocks by the action of the weather, in which frost plays an important part. The great wasting and wearing away of crystalline rocks in former geological periods, of which we have abundant evidence, is less difficult to be understood when we learn that rocks as hard as those of our New York Highlands become, even in our own time, under certain conditions, so softened as to offer little more resistance to the eroding action of a torrent than an ordinary gravel-bed.

---

* "Scientific Results of a Journey in Brazil. By Ch. Fred. Hartt." Fields, Osgood & Co. 1870.

Closely connected with this phenomenon in Brazil is that of the glacial drift. When Prof. Agassiz, on his return from Brazil, told us of evidences of the action of ice beneath the tropics, and as near the equator as latitude 8° south, the statement was so surprising that, notwithstanding his great authority, it was received by many with doubts. On his second visit to Brazil, however, Prof. Hartt gave especial attention to this question, and he gives us good reasons for maintaining that the unstratified, coarsely-ground detritus which overlies alike the disintegrated gneisses and the more recent deposits, and is found both on the mainland and on the islands off the coast, is in all respects similar in its character and mode of occurrence to the so-called glacial drift of our northern regions. He believes that at the time of its production the country stood at a much higher level than at present, and was covered by a general glacier, which, in its passage over the previously decomposed rocks, ground up the superficial layer, spreading it as a paste over the surface, where it was left after the melting of the glacier. We confess that the scepticism which we shared with many others as to the glacial drift of Brazil, is overcome by the evidence furnished by Prof. Hartt. This unstratified layer, however, in many parts of the country, reposes not upon the gneiss, but upon stratified clays and sands, which were by Prof. Agassiz supposed to belong to the drift, and thus contributed to swell greatly the extent of the drift formation as defined by him, but are supposed by Prof. Hartt to be really older deposits, and of tertiary age. It thus appears that while fully sustaining the discovery of glacial drift in tropical Brazil, our author excludes from it much of the material which Prof. Agassiz had referred to that period.

The comparisons between the geology of Brazil and that of the great Appalachian region of North America are very instructive, showing certain homologies between the northern and southern divisions of our continent. We have already noticed the Laurentian age of the Serro do Mar; and the greenish, micaceous, and chloritic schists, with diorites, hornblende rocks, and crystalline iron ores of the interior of Bahia, suggest the Huronian system (p. 298). The great mass of mica schists, however, in their general characters approached those of the White Mountains of New England; while the gold-bearing strata of Brazil, according to Professor Hartt, bear striking resemblances to those of Nova Scotia. These lithological similarities appear to be confirmed by the stratigraphical relations, showing how widely spread were the conditions which presided over the rock formations at these early periods of the world's history, and opening new vistas of study in comparative geology, as pointed out in the note by Dr. Sterry Hunt on page 550.

We must not conclude our notice of this instructive volume without again mentioning the fact, already noticed in our columns, that Professor Hartt, together with the professor of botany from Cornell and a large party of students, has spent the last few months in Brazil. The return of the party may soon be expected, and they will, doubtless, bring a rich harvest of materials for the further elucidation of the natural history of Brazil.

BELL'S TRAVELS IN NORTH AMERICA.*

It is not always the oldest or the most familiar proverbs which carry the most complete conviction. Occasionally, the very disgust produced in the mind by the wearisome repetition of a popular saying tends to blunt its effect on the imagination. It has been so often dinned into our ears that "Westward the star of empire takes its way," and we have not infrequently found so much of crudeness or vulgarity in the people most fond of urging the assertion, or in the methods of its enforcement, that one might almost be pardoned for regarding this well-worn apothegm with callousness, if not with resentful distrust. It may be perfectly true that the sceptre is passing westward; but the cultivated denizen of the Eastern slopes finds it hard to believe, and certainly very unpalatable when demonstrated. The Lowell manufacturer among his mills, the Broadway or Church Street importer going to his business through miles of commercial palaces, the Yale or Harvard professor sauntering through the venerable grounds of his beloved university, or the Fifth Avenue dandy fluttering his idle hour at Newport and Saratoga—each and all of these will naturally struggle against the disagreeable conviction that his wealth, his enterprise, his learning, or his fashionable splendor may, in an assignable period, be utterly thrown into the shade by the glories of some nascent metropolis in Arizona, Oregon, or California.

Perhaps the main value of such a book as Dr. Bell's to the general reader is the brisk stirring up of our ideas on this subject which it cannot fail to produce, and the renewed confirmation it lends to a truth which we would gladly overlook if we could. Though it may not convince us that New York and Philadelphia, Chicago and Cincinnati, are in immediate danger of becoming subsidiary to Santa Fé, or Denver, or Sacramento, it will greatly aid in clearing our notions about the great wave of Western progress, and furnish us with invaluable details for computing its scope and impetus. The author, a cultivated English physician and man of science, was appointed in 1867 to the position—nothing better offering—of photographer on the surveying expedition sent out by the Kansas Pacific Railway Company, "to determine upon the best route for a southern railway to the Pacific coast through Kansas, Colorado, New Mexico, Arizona, and the southern part of California." A vacancy in the corps shortly after its departure enabled him to take the more congenial position of physician to the expedition, which turned out to be a mere sinecure, and allowed him leisure for the extended and minute observations on physical geography, botany, geology, and mineralogy, with still further comments on habits and social condition of the races met in his journey, which he has embodied in the bulky volume before us. His photographic tastes, also, when once contracted, did not desert him, and the book is enriched with very good illustrations from views taken with his own hands. The work is a combination of the book of travels and the scientific report, and, as such, not altogether satisfactory reading for the general student. Dr. Holmes's witty criticism on a similar work, that, like the mermaid, it was impossible to tell where the fish ended and the lady began, is here applicable. Probably, the difficulty must be regarded as inseparable from the nature of such books; certainly the present volume has so inextricably mingled the statistical, the adventurous, and the picturesque that almost any one class of readers will have to take it with great allowance; the would-be speculator, miner, or contractor will grumble at the space wasted on Indian fights and sketches of scenery; the after-dinner reader, anxious only for pleasant excitement, will often get inextricably strayed in the mazes of Western geography, or hopelessly bewildered with the details of Rocky Mountain metals, products, and flora. Of its two merits—interest and information—the latter must be considered as predominant. Wild and adventurous as such a journey must needs be, the relation of stirring or thrilling incident, or the painting of picturesque scenes, is kept subsidiary to the main object of the book as of the expedition—the furnishing detailed and exact information about the country in every regard which could affect the location of the proposed railway. In all these matters the author seems to have been worthy of the highest praise, as indefatigable in the collection of his facts, at whatever risk and trouble to himself, as simple and concise in his statement. In an enterprise where personal observation is of the highest importance, where the *ipse vidi* of the writer would bear a value higher than Cæsar's, he might be excused if his narrative were plentifully sprinkled with capital I's. But the doctor is one of the modest and reticent type so common among his countrymen. Though he seems to have smelled powder more than once, and though his scalp must occasionally have felt an unpleasant creeping at the near prospect of Apache scalping-knives, he tells his story simply and almost barely, with a quiet stoicism which the red man, his assailant, might envy. After certain very terrible and pathetic scenes, where most writers would have been profusely lachrymose or impressive, he, with true British phlegm, drops the chapter and the reader with brief comment and little or no sentiment. For purposes of interest we could wish him less reserved, and in view of the rich material under his hands for picturesque description or thrilling narrative, we could pardon a little more of that fascinating, if untrustworthy, imagination which enlivens the pages of Dixon or Ludlow.

---

* "New Tracks in North America. By Wm. A. Bell." London: Chapman & Hall. New York: G. P. Putnam & Sons. 1870.

Principal elements of difficulty in the problem of running a railroad across the continent are heights, cañons, and lack of water and fuel. To all these points our author's observations were directly addressed. It would be impossible in our brief review to resume in any satisfactory way the manifold results of his enquiries; but the most ungeological reader may be interested in his preliminary chapters on the physical geography of the great central plateaus of the continent, with his clear bringing out of the one prominent feature in their conformation—the *mesas* and *cañons*. Briefly stated, the lesson of this chapter is that a large portion of the country between the Rocky Mountains and the Sierra Nevada is made up of high table-lands, or *mesas*, to give them their Spanish name, themselves the product of water-deposit from some vast superincumbent ocean in remote geologic periods, cut in every direction, through the process known as erosion, by streams from the mountains, which have gradually worn their beds deeper and deeper through the varied strata, and produced the curious and picturesque chasms known as cañons. Thus, instead of the gracefully swelling hills and glades, the sloping meadows, and placid lakes of our own Atlantic landscape, the traveller on the Plains sees for hundreds of miles only a succession of table-lands and perpendicular cliffs, intersected and sliced down, like pound cake cut up for tea, by these singular gullies, whose very existence he is frequently unaware of till he stands upon the verge of the chasm In the cañons, if by choice or accident he descends into their beds, he finds himself hemmed in a precipitous gorge, of varying width, but in many cases, especially the so-called Grand Cañon of the Colorado, far exceeding in height and savage grandeur the well-known gorges of the Tamina and Trient in Switzerland. This wonderful gorge was explored involuntarily, in 1867, by James Baker, a “prospector,” swept down on an improvised raft in his attempt to escape from Indians. His account is one of the most wonderful stories in the book; but is confirmed in all essentials by the report of Major J. W. Powell, who explored it with a party in 1869. A glance at the lithograph of the Colorado Plateau, in the introduction, does more for the imagination than pages of description, and impresses the reader with the impossibility of carrying a railroad through such a country. The only remedy would seem to be to “turn” the ravines, or avoid entirely the tract of country in which they are found; and to do this is a main object of the proposed “32d parallel route” in which our author was engaged.

The actual surveying work of the expedition commenced at Fort Wallace, on Smoky Hill Fork, in Western Kansas. At Fort Lyon, just over the Colorado frontier, they struck the Purgatoire River, and, following its course upward through the Big Cañon, crossed the Raton mountains and came down on the head-waters of Red and Canadian Rivers. From Fort Union, on the eastern slope of the Spanish range, they struck south-westward through the Placer Mountains by the Cañon Blanco, and came down on the Rio Grande del Norte at Albuquerque, with an intervening trip to Santa Fé. Thence, moving due south down the Rio Grande, and passing Forts Craig and McKay, they turned westward through the dangerous Apache country, over the Peloncello and Pina Leño Ranges, and through the picturesque Aravaypa Cañon to Fort Grant. Here, leaving the rest of the party to pursue their way towards the west and the head of the Gulf, Dr. Bell struck southward, with a guide, through Sonora, to investigate the feasibility of a branch road to Guaymas. From Guaymas by steamer, doubling the extremity of Lower California, he reached San Francisco, from which, by the then only partially completed Central Pacific, he got back by Austin and Denver to his starting-point at Fort Wallace. We are greatly tempted to insert in full his description of the *pueblo*, or fortified village, at Zuñi, on the head-waters of the Gila, and greatly interested in his sketch of the peaceful, industrious, and half-civilized Pueblo Indians at large throughout the States of Arizona and New Mexico. Very pleasant, too, is his account of the lazy simplicity and cool greenery of the quaint old Mexican town of Albuquerque, as, later, of that of Hermosillo. His bit of description of manners at the Santa Fé *baile* (dance) is very lively, and his comparison between the neatness of the Mexican peon and the Irish emigrant of the Eastern States very suggestive—especially to the latter. Very worthy of attention, too, is his recommendation to German or other emigrants of the Mesilla Valley, with its yet undeveloped possibilities of grape culture; and his calculation of potential thousands or millions of bottles which may yet pass over the South Pacific line makes one thirsty to read it.

HOLIDAY BOOKS FOR THE YOUNG.—II.[*]

If “genial” criticism is ever in place, it would seem to be in the case of that sort of literature with which we are concerned in this article. We are accordingly disposed to err as much on this side as is customary, but, being especially jealous in behalf of the infants, we sometimes lose sight of our purpose to judge lightly where judge we must. We can illustrate this with the two books first named below, whose exteriors prepared us for something out of the ordinary, and which, so far as the pictures go, might still be recommended, even if these were more crudely executed than they are. The “Little Red Riding-Hood Picture-Book” is one of the handsome quartos of the season, with showy, high-colored illustrations and large print. It is intended to amuse children in the divided syllable stage of reading, and reads like a publication of the Society for the Promotion of Cowardice and Cruelty. It opens with the popular classic which gives it its title, and the remembrance of which is, to say the least, not reassuring in the dark. This is followed by the “Three Bears,” but not the amiable three of our childhood—and, we are inclined to believe, the original three also—when we used to envy Silverhair her visit to them. Whoever edited the present version seems to have judged the other mawkish and feeble, for he makes his bears as frightful as possible, and a warning to all bold, meddlesome girls who go peeping into strange places. This, we suppose, is what is called fitting a story with a moral, and it has been done by degrading the character of all the actors, both beast and human. Next follow six short stories of animals, every one of which offers some spectacle of blood-thirstiness for the innocent little mind to dwell upon. Last of all comes the story of the “Three Little Kittens,” who lost their mittens, and it is the only one that seems to have crept in by accident as not likely to scare the timid or quicken the germ of cruelty in the strong. Of similar appearance, and, in its leading tale, fully as objectionable, is “The Snow-White and Rose-Red Picture-Book,” which, however, has as a set-off Hans Andersen's “Ugly Duckling,” for those who can appreciate it, and, with several illustrations to the page, “Cock Robin,” “Cinderella,” the “Three Bears” again, “Jack and the Beanstalk,” etc. The book is a made-up one, and all the last-mentioned stories are so patched, clipped, or otherwise altered as to be of little value except as explanations of the colored prints.

Very good books to keep from the young are the “Rollo and Lucy Books of Poetry,” in three graded volumes, prepared, of course, by the author of the Rollo and Lucy series of story-books, which was useful and respectable in its day—the day of canal and stage-coach locomotion, and somewhat later. Mr. Abbott's capacity for his present task is manifestly small indeed, whether one considers his selections or the “original” doggerel interspersed among them. In fact, taking account of his preface, one is forced to believe that the best poetry for youth is highly objectionable, since “the compiler has taken pains to exclude carefully from this collection everything that seemed to him to inculcate anything false, whether in matters of fact, in morals, in sentiment, or in philosophy.” Or else his criterion for poetry is the aid which any given piece can be made to render to family and school discipline. Here is a choice specimen of versification from the first book:

> “A mother was sitting one night at her table,
> And rocking her baby, that lay in the cradle.
> As she rocked him, the rocking grew slower and slower,
> Till the cradle at last did not move any more.”

In the third book, among the “pieces not before published,” or else the

[*] “The Little Red Riding-Hood Picture-Book. Containing Little Red Riding-Hood, The Three Bears, Dash and the Ducklings,” etc. With 24 pages of illustrations. New York: Geo. Routledge & Sons. 1870.

“The Snow-White and Rose-Red Picture-Book. Containing Little Snow-White, The Ugly Duckling, Nursery Tales, Mother Hubbard, and Cock Robin.” With 24 pages of illustrations. New York: Geo. Routledge & Sons. 1870.

“The Rollo and Lucy Books of Poetry. First, Second, and Third. Original and Selected. By Jacob Abbott.” With original engravings. New York: Dodd & Mead. 3 vols. 1870.

“Our Feathered Companions; or, Conversations of a Father with his Children about Sea-birds, Song-birds, and Other Feathered Tribes that Live in or Visit the British Isles, their Habits, etc. By the Rev. Thomas Jackson, M.A.” New York: Geo. Routledge & Sons. 1870.

“National Nursery Rhymes and Nursery Songs. Set to Music by J. W. Elliott.” With illustrations engraved by the Brothers Dalziel. New York: Geo. Routledge & Sons. 1870.

“Ranald Bannerman's Boyhood. By George MacDonald, LL.D.” With numerous illustrations. Philadelphia: J. B. Lippincott & Co. 1871.

“The Holiday Camp; or, Three Days' Picnic. A Story for Boys and Girls. By Robert St. John Corbet.” New York: Geo. Routledge and Sons.

"many anonymous articles, gathered from various sources," there are verses entitled "A Valentine," which we shall not quote, but the introductory note to which shows very well to what sort of a yoke Mr. Abbott is inclined to hitch Pegasus. It runs thus: "The following valentine was sent to a bachelor, accompanied by a little parcel. On opening the parcel, the gentleman found a *rib* of a very small animal, completely enveloped with white satin ribbon, ornamented with a true-lover's knot at each end, and another in the middle."

"Our Feathered Companions" is a book in all respects worthy of the holidays, and which has for its leading motive the preservation of birds by showing what a valuable part they play in human economy, and also how much more interesting they should be as objects of study than as victims of the fowler. This end is sought to be reached by a supposed conversation between a father and his children, in which, however contrary to the common experience, the latter seem to know as much about ornithology as the former. The result is a dialogue only in form, and one in which it would make no great difference if *Charlotte's* remarks were labelled *Tom's*, or *Freddie's Edith's*, or *Mary's Papa's*. The respective ages of the children are, we need not add, scarcely distinguishable; but the first remarks of *Tom*, which are introduced as if not above the heads of his brothers and sisters, would, we opine, be quite impossible in an American family in similar circumstances. *Papa* has just opened the conversation by welcoming the exchange of the city for "the shore of the ever-sounding sea," and *Tom* takes up the parable in this wise:

> "I think that phrase, 'the shore of the ever-sounding sea,' pronounced slowly, echoes the sense of the words as delicately as Homer's celebrated line ending with
>
> 'Πολυφλοισβοιο ϑαλασσης.'"

The illustrations of this book are numerous and well-drawn, though the figures are not to be compared, for their action, with Michelet's "Birds," nor of course for fidelity of form and plumage with Bewick's masterly designs; and, as we have said, there is here an excellent gift for Christmas or New Year's.

In all that pertains to the manufacture, we cannot speak too eulogistically of "National Nursery Rhymes." It is an admirable sample of the art of book-making, in binding, paper, and typography. Mr. Elliott has selected upwards of fifty rhymes, from Mother Goose chiefly, prefixing to each a capital design illustrating it, and set the whole to music. The pictures alone are worth the price of the book. We will even go farther, and say that the head-piece on page 10, "Nineteen Birds," is worth the price; while there are a score of others which have, perhaps, as good a right to be mentioned—say, "I had a little doggy," on page 12, which for sentiment and drawing it would be difficult to surpass. Mr. Elliott was attempting a very great task when he set about composing over fifty melodies, which needed to be not only "within the capacity of children's execution and the compass of children's voices," but of that catching originality and swing which should at once ally itself to the verse, never to be separated from it. To make to order six tunes worthy of the immortality of Mother Goose would have been a feat; so that we shall not be thought to praise too little when we say that the composer has got through his stint like a gentleman and a scholar. The tunes are simple and graceful, and harmonized in good memory of classic models. It would have lightened Mr. Elliott's task and not made the result less valuable, we think, if he had preserved a few of the old tunes that, in one way or another, have attached themselves to certain of the nursery rhymes. Possibly, though, the English public never had heard "Baa, baa, black sheep" sung to the "Prayer" in "Zampa," nor the Hutchinson's excellent "Spider and the Fly," which we cannot dismiss for a new tune, however elaborate; or our "Twinkle, twinkle, little star;" or the old, very old, "Margery Daw;" or that perfect bit of music, wherever it came from, "The north winds do blow"—we wish we could transcribe it here. Also, the English opera bouffe has been singing to us "The old woman that lived in a shoe" to "Pretty, pretty Polly Hopkins;" and other rhymes to other tunes equally venerable and acceptable, for so long that it becomes difficult to detach them and take on the new and delicate but somewhat characterless *motifs* of Mr. Elliott.

"Ranald Bannerman's Boyhood" is likely to prove interesting to both boys and girls not under twelve, in spite of its formal language, and its tolerably frequent wanderings into the realms of sentimental reminiscence, so dear to old people and so worthless to children. The interest is in the episodes of the story, which read like real occurrences, and are very lively and entertaining. We are at a loss to understand why Mr. MacDonald feels it necessary to keep to such strict English, and apologize so overmuch for the few passages of Scotch dialect that he must introduce. To put the elegant language, with due care for the subjunctive, into the mouths of his Scotch peasants, makes them absurd. There may be somewhat too much of Scotch in the dialogue of a story, as every one knows who has had to seek a glossary to make the sense; but a modified Scotch is not only pleasant to read, but desirable for a boy to understand who has Scott's novels before him. However, we had no intention of going into any artistic considerations in noticing this little story, for its merits end with its morality and its readable anecdotes.

As a mere narrative, "The Holiday Camp" has merit, and the incidents are all probable enough. A bevy of boys and girls camp out for several days, under proper restrictions, in the woods of an English gentleman's estate, near a brook and lake, which give them fine opportunities for fishing and boat-racing. There is a rebellion in the boys' end of the dormitory, which is quelled by a vigorous use of the slipper in the hands of the head-boy, but the principal sensation is the capture, after a severe conflict, of three burglars, caught prowling about the premises at night. The author insists a great deal, after the manner of his countrymen, that fair-play is an English virtue; and of the pluck and beefiness of Old England there is quite as much as is necessary in the slang discourse of the regattas. Except these, and some minor drawbacks, due to the scene of the story, we find nothing objectionable, and much that is likely to interest, in the story. We note with some satisfaction that the author has heard of Mark Twain's "Jumping Frog," and introduces him in a simile, on page 10.

MR. LINCOLN'S STATUE IN UNION SQUARE.

THE statue of Mr. Lincoln in Union Square, freed from its wrapper of planks, appears now united to its pedestal. A general objection to the statue itself, expressed when it alone could be seen, was rather a pleasant thing to notice. A dozen years ago, a better or worse work of art would have troubled fewer people. There is, naturally enough, a toleration of statues in the open air. A mass of metal and stone must needs exert itself somewhat, through art, to be offensive under the genial influences of light and atmosphere. There is no doubt that, separately, the statue was called a failure; and in its seeming to be a simulacrum of Mr. Lincoln, even to his clothing, realism appeared to be at fault. The baldness of a literal copy of nature accounted for all defects, until the evidence of failure by accumulation of mistakes made the statue interesting as a lesson of what not to do. As each little misapprehension of the point came up, one recognized a certain general character of error, accounting for the respectful dislike of statues which most people obscurely feel.

Certainly, given a portrait of Abraham Lincoln in his usual clothing, no chance is left for the usual attempts at beauty through elegance or proportion. By so much, then, is the task simplified. Mr. Lincoln was neither graceful nor majestic in person or in gesture, but his typical ugliness, not devoid of dignity, gives to the artist a figure logical in its very defects, and seen to advantage in certain definite positions only, any of which could be exactly ascertained. These difficulties have this further advantage, that if frankly accepted they ensure character, the ideal of realism, and avoid compromise, the curse of art. Art in itself is compromise enough; so much has to be given up in its use that all remaining truths need to be reinforced, exaggerated sometimes, to recall the settled purpose in the nature we dare to imitate. Here, then, the straitened conditions of his subject should force the artist into realism, for which his metallic material gives him peculiar facilities. The clothes to be imitated are flimsy, and make sharp folds; they can be perfectly realized in the tenacity of bronze, and by so doing—by breaking folds as vigorously as on the real, by accentuating the projection of edges—the shining flatness of the metal can be broken up and the eye be directed to the main points of attention, and the particular truth becomes subservient to the general meaning. All the more, too, that such imitation of the thinness of the covering can help by contrast the great merit and power of sculpture, the assertion of the body's structure under drapery—a very distinct character of the bony frame of our hero.

This is what might be: let us see what hesitation will produce. A memory of the sculptured toga or pallium shall persuade to the copying of a coat no longer of cloth but of clay or stone, made, it is true, according to the cut of Mr. Lincoln's, but padded out with the comfortable wadding of some other man's body; and, remembering Mr. Story's statue in Boston, shall we say that of Mr. Everett? The trowsers, also, in their ponderous slope, shall be made to look as if they carried the mass above without the help of any interior legs. Above, where the thin shoulders characterized the man, and by their drooping gave importance and a certain sad sentiment to the head, all shall be hidden with a heavy cloak whose classical folds shall call attention to the meanness of our present costume. The marked features whose lines and wrinkles the bossy and edged metal might have paralleled, shall be smoothed and flattened out, and shine with a brazen polish. To end it all, the anatomical improbability of a gesture and attitude suited to any other man shall help to add another monotonous statue to the list already published in metal and in stone.

For, unfortunately, this tale of a statue is the story of many others, and therefore is told here. All such contradictions have been carried out even against difficulties, rather than to follow a programme without compromise. It has been observed by some critic, perhaps in exaggeration, that whereas most pictures by fairly good painters are signed in their very execution, most statues need a catalogue of authors, and of modern portrait statues that they could scarcely be known apart were their heads but taken off. Fortunately it is not so in nature: she is as fresh to-day as when centuries ago hundreds of sculptors, not born with greater talent than those of our time, filled Italy with lifelike and poetic works. But they disliked compromise in art, and recognized in realism the safeguard of the ideal. Not of them could we say that they made the statues of other statues.

JUST PUBLISHED BY

PORTER & COATES,

822 CHESTNUT STREET, PHILADELPHIA.

Longfellow's Poets and Poetry of Europe.

A New and Revised Edition, just completed, by H. W. Longfellow, with the addition of 150 pages of entirely new matter never before published, making it one of the most elegant and complete works extant. With Introduction, Biographical Notices, and Translations, from the earliest period to the present time. By Prof. Henry Wadsworth Longfellow. Illustrated with engravings on steel and engraved title. Imp. 8vo, cloth, extra gilt top, bevelled boards, $6; sheep, marble edges, library style, $7 50; half-calf, gilt, $9; Turkey morocco, $12.

"This valuable work contains selections from about four hundred authors, translated from ten languages. Mr. Longfellow himself gives us translations from all these languages but two."—Allibone's Dict. of Authors.

"This edition has been revised and enlarged by the author, and contains his last touches and additions to his labors."—The Age, Philadelphia, Nov. 3, 1870.

"It is now a better book than ever, the Professor having added an Appendix and a Supplement, the latter dated 1870, containing a very precious list of newer poetical translations. . . . The supplement is very choice and interesting, and absolutely rejuvenates the work. Here we have specimens from Bayard Taylor's translation of 'Faust,' not yet received in complete book-form, etc., etc."—Evening Bulletin, Philadelphia, Nov. 5, 1870.

Hedge's Prose Writers of Germany.

A NEW AND REVISED EDITION.

With Introduction, Biographical Notices, and Translations. By FREDERIC H. HEDGE, D.D. With Six Portraits on Steel and Engraved Title. Imperial 8vo, cloth extra, gilt top, bevelled boards, $5; sheep, marbled edges, library style, $6; half-calf, gilt, $7 50; Turkey morocco, $10.

"There is no book accessible to the English or American reader which can furnish so comprehensive and symmetrical a view of German literature to the uninitiated; and those already conversant with some of the German classics will find here valuable and edifying extracts from works to which very few in this country can gain access." —Prof. A. P. Peabody, in North American Review.

"A new and beautiful edition of a work of sterling merit."—The Age, Philadelphia, Oct. 29, 1870.

"It is a photograph such as is very much needed at this juncture for instant study."—N. A. and U. S. Gazette, Philadelphia, Oct. 27, 1870.

"Universally recognized as one of the best collections of specimens of German literature in the English language."—New York Tribune, Oct. 28, 1870.

"Its merits and value are well known. In this enlarged edition it will be sure to find renewed favor."—Boston Post, Nov. 3, 1870.

ATHENS.

VIEWS OF THE ACROPOLIS.

The undersigned will publish for the author an Album of photographic views, entitled "The Acropolis of Athens, Picturesquely and Architecturally Illustrated, by W. J. Stillman," printed in carbon by the Autotype Company, London.

These indestructible photographs are from 8x10 inch negatives, taken by Mr. Stillman during the winter and spring of 1869, and include all the views which are necessary to give the most complete idea of the existing ruins on the Acropolis, and their relation one to the other. They were taken with architectural lenses correcting the perspective distortions, and so that the proportions of the buildings may be measured as to scale, on any given plane; and most of them by Dallmeyer's wide-angle rectilinear lens, by the aid of which views never before successfully photographed have been rendered.

Of the twenty-five subjects, sixteen have not been taken by any other photographer, and the negatives used are selected from not less than 300 taken. The picturesque views show the Acropolis from five exterior points of view, and the architectural show those characteristics of Greek architecture which contribute to its unexplained as unapproached perfection—the curves of the horizontal lines, pitch of the columns, etc.

They are mounted on board about 13x22, with a page containing description opposed to each print; the whole bound in substantial and elegant style. As a holiday gift this Album is unsurpassed by any publication of the year.

Price, delivered at the *Nation* office, 3 Park Place, New York, $25.

The Nation.

NEW YORK, THURSDAY, DECEMBER 8, 1870.

The Week.

The President's message has, like all his compositions, the merit of directness and clearness and simplicity—forming in this respect a marked contrast to the State papers of most of his later predecessors, except Mr. Lincoln. Nothing can be better than the account of the "policy" of the Administration which he gives in the closing paragraph—faithfulness and economy in the collection and disbursement of the revenue, reduction of taxation, fair dealing and avoidance of war with foreign powers, reform in the civil service and in the treatment of the Indians, the prompt payment of the public debt, and the purification of elections. Nothing could well be more attractive than all this. Looking through the message for the necessary explanation of these various generalities, we find that with regard to the foreign policy of the Government, Mr. Washburne did not, as we and most other people supposed, recognize the French "Republic" on his own responsibility. He was directed to do it by telegram from Washington. But the President falls into a curious error when he says that this telegram was sent "as soon as he learned that a Republic had been proclaimed in Paris, and that the French people had acquiesced in the change." The President had no information at that time as to the feeling of the French people about the change of government, and could not have had; and, as there is now no doubt, hastily and suddenly and needlessly recognized a form of government which was not pleasing to "the French people," and which they were not, and have not yet, been consulted about. All that he need have done till the people had been consulted was to recognize the Provisional Government as the *de facto* government of the country. He relieves Mr. Washburne also in some degree from an imputation thrown on him by Mr. Kapp in our columns, by saying that he had discharged the duties of the protectorate assumed over German subjects resident in France to the satisfaction of the North German Government; we believe, however, the North German people do not share the satisfaction of the Government. The message bears hard on Spain for her arbitrary proceedings towards American citizens in Cuba, and once more urges, with an approach to enthusiasm, the annexation of St. Domingo, both on political and commercial grounds. It repeats that curious assertion about the imports from St. Domingo helping us to pay the national debt which has made so many people eager to learn who supplies the President with his political economy. He is evidently still of opinion that if the American flag was hoisted in the island, a mysterious change would take place in the character of Dominican products, which would enable the Treasury to profit by them in a way it could not now do. This and his remark about the difficulty in the way of paying the national debt, caused by the exports of the gold of our mines, shows that he is still laboring under the delusion that the debt can be paid in some other way than by taxation, and that by keeping things in the country simply, the burden of the Government can somehow be lightened. The *Alabama* claims he dismisses in a few words, still without defining the satisfaction to which he thinks the United States is entitled, but he very wisely recommends Congress to pay the individual claimants, and thus transfer their rights to the United States. This ought to have been done long ago. On the whole, all that he says of the foreign policy of the Government, whatever objection may be taken to some details, is wise, temperate, and statesmanlike, and proves that Butler's rhodomontade finds no echo at Washington. The statement of the case against Canada, as regards the fisheries, and the navigation of the St. Lawrence, will command the assent of all intelligent men.

About revenue reform, the President talks somewhat loosely, declaring that if "revenue reform" means the collection of the whole revenue by direct taxation, or the failure to provide money to meet the public liabilities, he is opposed to it. With all respect be it said, this is very foolish talk. He might nearly as well have declared that "if revenue reform means arson and plunder, I am opposed to it." When he made up his mind to mention the subject, he ought to have taken pains to find out what the revenue reform really did call for. There is something very uncandid, to use a mild word, in pretending to believe that any man who asks to have the present tariff simplified, and the duties lowered and diminished in number, must want either direct taxation or repudiation. He ought to have left this sort of talk to the New York *Tribune*. About the civil service reform he speaks as frankly and heartily as regards the need of it as any one could desire. We only wish he had gone into details, and had submitted or suggested a plan. All Congressmen and politicians are in favor nowadays of "civil service reform;" but when you come to ask them to support a particular measure of reform, they "swear off." The President might bring them up to the mark by banishing Forney, Chandler, and Cameron from his confidence, by sending all office-seekers before a board of examiners, by forbidding the levying of black-mail in the guise of "assessments," and by urging on Congress the passage of a law creating machinery for putting an end to Congressional interference with appointments.

The Report of the Secretary of the Treasury is looked upon as important mainly for indicating what a shrewd politician thinks are to be the earliest national issues. It consists principally of arguments in favor of protection and against civil service reform, neither novel nor wise. Beyond these, it admits the failure of the funding scheme as now authorized, and asks for authority to increase the amount of 5 per cent. bonds to be issued for the purposes of funding. It suggests rather than recommends that national banks be prohibited from paying interest on deposits of any kind, and in compensation offers to have their mutilated currency exchanged at Government expense. It hints at the public sentiment in favor of substituting greenbacks for national bank-notes, but takes strong ground in favor of the banks, "as agencies by which business is established (!) and fostered," and as entitled, therefore, we infer, to tax the public for their private benefit. The Secretary unconsciously furnishes a strong argument against high import duties, by showing the increased expense of collecting the revenue and the enormous increase in the opportunities for smuggling. A plea for better salaries for the Department clerks, and a feeble assertion that the reduction of the debt has helped the spread of republicanism in Europe, close a report which hints at many things, but speaks out on none. The report of the Comptroller of the Currency is a plain, sensible business document. Its chief interest is to be found in the acknowledged failure of the "Currency Bill" of last session, which, as we repeatedly explained at the time, was an absurdity. No distribution of currency under it has taken place, and only $3,000,000 have been added by it to the banking capital of the country, showing clearly that deficient banking facilities in any part of the Union are due to a deficiency of *capital*, which legislation cannot supply.

We asked last week for a sight of the "examination papers" of the seat of learning known as the Treasury. We subjoin, in the meantime, one we use in one of our fashionable custom-houses—we will not mention which—over which Mr. Boutwell also presides. It will be seen that anybody who passes this ordeal must be a perfect pundit. The universities must look to their laurels. We may add that we reproduce the printed form verbatim:

Examination of................................

For the Office of........................

1. What is your age?
2. Where were you born?
3. If not born in the United States, are you a naturalized citizen?
4. When and where were you naturalized, and in what court?
5. Where do you reside?
6. Have you a family, and if yes, of how many persons?
7. Where does your family reside?
8. Have you any profession or trade, and if so, what?
9. Are you at present engaged in any business, trade, or occupation? If yes, what and where?
10. Have you ever held any civil office in any department of the Government, and if yes, what office, and when?
11. In what profession, business, occupation, or trade have you been

engaged within the last ten years? Give the names of the persons by whom you have been employed.

12. Have you served in the Army or Navy of the United States? If so, in what capacity, when, and how long?

A great many papers and politicians have, during the last fortnight, been trying to find some one who says he is going to found "a new party," but have thus far been unsuccessful. The Chicago *Tribune* denies that it entertains any such intention, or ever did; Senator Schurz denies it, and the New York *Evening Post* denies it, and Gratz Brown gives no sign of having any such enterprise in hand. The result is great chagrin amongst the people, who think the great and only work of the Republican party now is the reduction of the national debt. What has been taken for a desire or design to found a new party has been simply a design to make the old party attend to the proper business of the party in power, by legislating for the necessities of the time. There is a strong disposition on the part of the old hacks not to do this, but to go on infusing "economy and efficiency in the collection of the revenue," and nothing would please them better than that those who are not satisfied with this should take themselves off and try to establish a little concern of their own, and give no further trouble. We believe the intention of the malcontents, however, is and always has been, to stay where they are and give all the trouble they can. Whenever the time comes to establish a new party, it will make its appearance, whether anybody charges himself with the special work of getting it up or not.

Paris has had almost a week of firing and fighting around its walls. On Monday, Nov. 28, the forts, especially those to the south, opened a furious cannonade against the Prussian positions, which was maintained during the following night and day. Fort Mont Valérien was particularly active about midnight, when the French began a movement against Bezons, on the outer peninsula, formed by the bends of the Seine, north-west of the city, and made an attempt, real or feigned, to throw bridges across that river. The Prussians were concentrated on the peninsula, and the fighting at this point did not go beyond an exchange of musketry fire from the opposite banks. At eight in the morning of Tuesday, the 29th, another half-serious attack was made on the Prussian Fifth Corps at Montretout, south of Mont Valérien, by Gardes Mobiles, the heavy cannon of a new outwork of this fort and gunboats on the Seine co-operating. The shelling was vigorous, but the infantry attacks were only of a tentative kind, and more apparent than real. After a few hours of skirmishing, the Gardes Mobiles were withdrawn. The real sortie in force of that day began about an hour after the opening of the demonstration against Montretout, the besieged coming out from Villejuif, in front of the southern forts Bicêtre and Ivry, and advancing against the Prussian Sixth Corps and the Second Bavarian, stationed around L'Hay, Chevilly, and Choisy-le-Roi. Here, too, gunboats on the Seine and the cannon of a newly erected outwork covered the assault, which was fierce at the beginning, but gradually slackened, the field-batteries of the Germans throwing the French into disorder. After two hours' fighting, General Vinoy, who commanded the sortie, withdrew. General Ducrot, it is stated, was prevented from making a concerted movement further east, across the Marne, by a sudden rise in this river. The entire German loss in the various actions of the 29th, according to a Versailles bulletin, consisted in a few hundred men, "while the French lost sixteen hundred in prisoners alone."

Cannonading was kept up by the French throughout the following night, and on Wednesday, the 30th, more vigorous and combined, though not quite simultaneous, sorties were made under Vinoy, Ducrot, and perhaps Trochu himself, against the Prussians on the south, the Würtembergers on the south-east, and the Saxons on the east, accompanied by serious demonstrations on the north and west against the Prussian Fourth Corps and the Guard. The principal fighting took place on the southeast and east, around the double curve of the Marne—which Ducrot crossed with a very heavy force—at Mont Mesly, Bonneuil, Ormesson, Champigny, Villiers, Brie, and Noisy-le-Grand. A number of positions were taken by the French, who fought with unusual vigor, but ultimately most of them were retaken—the Würtembergers, who seem to have borne the brunt of the protracted battle, receiving heavy reinforcements from several Prussian corps. King William, in announcing the result, states that the French were "driven back behind their works in all cases," and General Von Tümpling, in a separate despatch, adds, "The German losses were trifling;" but neither statement is fully borne out by subsequent reports. The facts are, that the Würtembergers and the Prussian Second Corps alone lost about sixteen hundred men, and that the French, though repulsed with heavy loss from most of the ground gained in the earlier hours of the several conflicts, remained in possession of the Marne peninsula east of the Bois de Vincennes, and of various bridges thrown across the river.

On Thursday, Dec. 1, no attempt was made either by the French to advance or by the Germans to dislodge Ducrot from the east bank of the Marne. At daylight of Friday, the 2d, however, a powerful assault was made on the French positions at Brie and Champigny, at the outer extremities of the Marne peninsula, by two corps under the Crown Prince of Saxony and a division of Würtembergers. Ducrot withdrew within the peninsula, towards Le Tremblai, covering his flanks by the river. The advancing Germans suffered severely from the fire of Forts Nogent and Rosny, and when met by fresh troops from the city, crossing near Brie, momentarily gave way, but subsequently rallied, and the sanguinary contest ended with the retreat of the French, who abandoned Brie and Champigny with the loss of eighteen hundred prisoners and seven guns, but continued to hold the bridges across the Marne. The losses in killed and wounded were heavy on both sides, the Würtembergers alone officially acknowledging a loss of eight hundred and forty-eight. On the 3d, there was no fighting of moment, but the French, receiving new reinforcements, seem to have advanced once more, and to have reoccupied Champigny, for later reports again announce their abandoning it. At last accounts they were massing at Creteil, in front of Fort Charenton, between the Marne and the Seine. The Prussians are said to expect reinforcements from General Manteuffel's army, which is reported to have occupied Albert, Abbeville, and Rouen.

Simultaneously with these conflicts, the German and French armies north of the Loire were engaged in a no less serious and important struggle. On Monday, the 28th, General D'Aurelles de Paladines, with two corps and portions of two others, made an attack on Prince Frederic Charles's army, at Beaune-la-Rolande, between Montargis and Pithiviers, with the intention, it is believed, of breaking through the vast semicircle of forces pressing on the Army of the Loire, of separating the Grand-Duke of Mecklenburg and Von der Tann from the Prince, and then pushing directly on Paris by way of Fontainebleau. This bold scheme was defeated by a signal repulse, in which the French, according to the Prince's report, lost five thousand killed and wounded and sixteen hundred prisoners, while the total German loss amounted only to one thousand. Contracting their forces towards more central points opposite Orléans and the strong French positions at Artenay, Chevilly, and Neuville, north of that city, the Germans evacuated a number of places previously occupied in the Departments of Sarthe, Loir-et-Cher, and Loiret, and resumed the offensive. On the 30th, according to French reports—which are neither confirmed nor contradicted—they met with a repulse; but on the following day, Thursday, December 1, Von der Tann defeated the Army of the Loire, the bulk of which had shifted its positions to the left, in several successive engagements near Artenay; and on Friday, the 2d, the right wing of the Germans, under the Grand-Duke, achieved a more decisive victory over two French army corps at Bazoches-les-Hautes, driving them towards Orléans, and capturing several hundred prisoners and eleven guns. Frederic Charles himself completed the defeat of the Army of the Loire on Saturday, the 3d, by forcing it from its entrenched positions at and around Chevilly. D'Aurelles de Paladines thereupon advised the Government at Tours of the necessity of evacuating Orléans and retreating to the south bank of the Loire. The Government hesitated to give up the last chance of opening communications with the besieged capital, and D'Aurelles de Paladines himself for a moment changed his opinion, but the capture by the Prussians of a suburb of Orléans, in which thirty guns and a thousand prisoners fell into their hands, finally decided the abandonment of the city. At what point the shattered French army intends to make another stand, we have yet to learn. In the meanwhile, Garibaldi tries to comfort the French Government by frequent announcements of successes—of little magnitude, however—achieved before Autun, and between it and Dijon. The mention of all the three corps of Frederic Charles's army in the accounts of the battles before Orléans proves that General Von Werder, who operates in Burgundy, has not been reinforced by the Tenth Corps, as was previously reported.

Prince Gortchakoff's circular in reply to Earl Granville, about which there has been so much curiosity, has reached us in full, but contains nothing of importance except the form with which the public had not been already made familiar through the telegraph. The form is, however, of importance, as it is in this that the real intention of Russia is at this stage of the proceedings to be looked for. It was the brusqueness of the first note which led to the general expectation of war. Nothing can, however, be more conciliatory than the tone of the second. It says the peremptoriness of the first was unavoidable, as it seemed impossible for Russia to get redress through a general congress, while the great change in the circumstances of Europe since 1856, as well as the galling nature of the conditions imposed by the treaty of that year, made it intolerable for her. If England, however, now thinks a congress can be got together, nothing will please Russia better than to take part in it, and she is ready to "maintain her adhesion to the general principles of the treaty, and to conform to its general stipulations or to renew them," provided she be released from the restrictions it imposed on her alone of the signataries. The sum and substance of the whole matter is, that while Russia does not recede from her position, she is not ready to commit any overt act in support of it, does not meditate any aggression at present against Turkey, or the assumption of any exclusive guardianship of the Eastern Christians, and is really anxious not to fight. What has influenced her in taking up this more pacific tone is matter of doubt; but it is either the bellicose temper displayed by the English public—the state of the public mind in England being something which Russian statesmen apparently find it difficult to understand—or else expressions of dissatisfaction from Bismarck at Russia's early move—the "understanding" between them having probably put off all action in the matter till the close of the war with France. As long as the siege of Paris lasts, and the Army of the Loire is still in existence, Bismarck is hardly prepared for any fresh complications, and he may have, and probably has, expressed his dissatisfaction at the introduction of the Black Sea question on the scene. The last news looks more warlike, being neither more nor less than a despatch from Granville asking for the withdrawal of the first Gortchakoff despatch, which might be pacific enough, if not accompanied by an implied threat that in case of refusal the English embassy would be withdrawn from St. Petersburg.

Carlyle has written a letter to the papers on the Franco-Prussian struggle, taking the ground with regard to the moral aspect of the war, and the justifiability of Prussian claims on Alsace and Lorraine, with which the Germans and their sympathizers have already made the world familiar, but of course presenting it much more strongly and more picturesquely than others by his peculiar diction. He is terribly severe on French character, and especially on their mendacity; but the facts of the war unhappily go far to justify him. He ought to have pointed out, however, what every day appears more clear, that while a man may be a tremendous liar, and yet an excellent artist, or a useful philanthropist, or soul-stirring humanitarian, the habit of untruthfulness is fatal to success in politics, and any people of whom it has taken possession may bid farewell to good government until they can get rid of it; and to this danger any people which takes up the sentimental method in dealing with politics is, as we have several times tried to show, peculiarly exposed. The reason is plain enough: the Sentimentalist finds nearly all his premises in his own emotions and assumptions, and is almost always in a state of great exaltation. Now, reasoning from his own emotions and assumptions, he is constantly brought into collision with the facts of life, and being unable to get rid of them, and being prevented by pride and excitement from surrendering his preconceptions, he is strongly tempted, first, into shutting his eyes to the facts, and then—finding that this does not convince others—into denying their existence, or presenting them in a false light. But the art of politics consists wholly in the observation of facts, and in the adaptation to them of manners and legislation. It is his keener perception of the facts of human nature which leads the New England farmer, for instance, to submit to debate and vote on questions which the Irish peasant endeavors to decide by giving his opponents a "batin'" with a stick. Every young man, therefore, who wants to serve his country as a citizen, will set his face against transcendental politics as, next to the tyranny of brute force, one of the greatest curses that can afflict a people, and will cherish the habit of seeing and talking about things exactly as they are. It is not always *pleasant*, but it is healthy.

There is, perhaps, no better feature in the new English Education Bill than that which makes women eligible for the school-boards. There is probably no work of the world for which they have such undeniably high qualifications as the work of education, and they have had an experience of it such as the other sex can certainly lay no claim to; and they stand in a relation to children which men can never assume, no matter how hard they try. That nature meant women to be teachers at least, is a proposition which finds a place in every theory of their rights and duties. Whenever and wherever the conditions under which children can best be taught comes up for discussion, they are entitled to the first hearing. It is gratifying to find, therefore, that the three ladies who presented themselves as candidates for the London School Board have all been elected, and more gratifying still to know that two of them at least have done honest work. Miss Garrett has done an amount of research, and hard thinking based on research, which have placed her in the foremost ranks of the medical profession, and has thus done more for the suffrage "cause" than ten dozen stump-orators and tract-distributers. A good many women have entered on the thorny path in which she is winning honors, and they may rest satisfied that they are the real champions of their sex, if champions it must have. The work of the hour for women is not going about preaching that women ought to be lawyers, but learning law; not preaching that women ought to be doctors, but studying medicine; and not declaiming in halls on the intellectual equality of the sexes, but buckling down, in lonesome, dull studies and chambers, where nobody is looking on, and proving it by thinking a few things out the way men think them. This would not be half as agreeable as attending a convention, but it would be vastly more effective, and *is* vastly more effective wherever tried.

In the face of the apparent pacific aspect of the Eastern question, cotton has declined both here and abroad, under extraordinarily heavy receipts at our Southern ports, which strengthen the prevailing belief in a very large crop. Breadstuffs are dull and lower, as are also meats and dry-goods; and coal is decidedly lower. In short, with few exceptions, everything is gradually, slowly declining in price. There continue to be occasional failures, and here and there a suspension of work, with rumors of numerous intended strikes, but there is no alarm or uneasiness anywhere, only a steady settling down of consumption to a basis of the strictest economy, with a corresponding decline in the amount of business done, and a more than corresponding decline in prices. The wool trade and wool manufactures are almost the only interest reporting an improved trade after the severe depressions suffered for the last four years. Real estate, after one or two successful public sales, looks better, but dealers are anxious and nervous. It is noticeable that in many public sales under foreclosure, only a nominal price over and above the mortgage is reached, showing that too large advances have been made. It is also remarkable that second mortgages can be bought constantly at rates yielding an interest of ten and twelve per cent. per annum—sure evidence of speculative holdings in weak hands. The chronic dulness of Wall Street has been relieved by a slightly increased activity in money, owing mainly to the shipment of currency to the South and Southwest, to aid in the movement of cotton and pork.

POLITICAL "WORK."

When the Reform Bill—that is, the bill abolishing "rotten boroughs" and enfranchising the great towns, or, in other words, giving the election of members of Parliament to qualified voters instead of having them nominated by peers or large landowners—was before the English House of Lords in 1831, the Duke of Wellington asked a question about it which has since become famous, and which expressed very concisely the objection to the abolition of great abuses felt by most upholders of them. He enquired with great emphasis, if the bill was passed and the House of Commons converted into a popular representative body, "how was the king's government to be carried on"? That is, his mind was so familiar with the nomination of the members of one house by the members of the other, that it had assumed in his eyes the shape of the only possible way of making a constitutional monarchy work—a part, in short, of the natural order of things. Alter it, and the whole machine, as it seemed to him, would go to pieces.

The feeling entertained so extensively by politicians in this country, and which they avow in very much the same artless, puzzled way as the Duke of Wellington—that the work of party government cannot be carried on if the mode of hiring and discharging government officials now in vogue should be modified—is another and no less interesting illustration of the working of the law of association in a widely different state of society. The state of facts out of which this feeling has taken its rise here is of much more recent date than the phenomena on which the Wellingtonian mind dwelt with such fond faith, and it derives even less support from the generally received theory of the Government or from the national manners. The English rotten boroughs were originally real boroughs with more or less population, and the great towns which the Reform Bill found unrepresented were not in existence when the basis of representation was fixed. So that, putting together the English reverence for established usage and for aristocracy, and the ancient hold of the great landowners on the management of political affairs, there was something by no means illogical or unaccountable in the constitution of the old House of Commons, and it could also be said in its favor that it had contributed to the roll of English statesmen most of its brightest names. Many of the greatest English politicians, indeed we might say most, made their first appearance in Parliament on the nomination of peers; so that, on the whole, the poor Duke, whose mind was anything but philosophical, might well have been pardoned for fearing that any change in the system meant chaos.

Our system of filling offices, on the other hand, is utterly opposed to the theory of the Government. In the first place, it deprives the President of power committed to him, and relieves him from responsibility expressly imposed on him by the Constitution. In the second place, it causes members of Congress to attempt the performance of executive functions to the neglect of their legislative functions, or, rather, saddles the same men with the performance of two sets of incompatible duties, a combination which in the theory of this Government has no place whatever. In the third place, it is not of ancient date; it took its rise under the eyes of men now living. In the fourth place, its origin is not respectable; it was originally a device resorted to by a bad, bold, and unscrupulous man for the gratification of his malignant passions. In the fifth place, it is utterly opposed to the usages of the country, which is *par excellence* a country of business men and business habits, and therefore is in no way prepared for the spectacle of large bodies of persons employed at regular wages to do work requiring honesty and industry and skill, without reference to their character and qualifications, and liable to dismissal in spite of their efficiency. There is nothing in the habits or traditions of the people calculated to make this state of things seem natural or desirable; on the contrary, their whole training has a tendency to make it seem unnatural and undesirable. Nevertheless, forty years' familiarity with it has satisfied large numbers of ordinarily sensible persons that, good or bad, it is indispensable, and has deprived them of the power of conceiving of party government in a republic without it, just as familiarity with rotten boroughs deprived the Duke of Wellington of the power of conceiving of a constitutional monarchy based on a fair popular representation.

We have before us the letter of a correspondent, who brings out in a striking way the strength of the hold which this association of ideas has secured on people's minds. He says:

> "I was talking about the civil service to-day with a broken-down clergyman, whose old parishioners had secured him some sort of work to do at Washington. He said frankly that he would rather see his son carrying a hod than acting as a Government clerk; yet he had written against Mr. Jenckes's Civil Service Bill last winter (which he said made quite a stir in the departments), and he could not see his way clearly to the abolition of the present system of appointments. 'Most of the work done at Washington,' said he naïvely, 'is *political* work; and there must of necessity always be a great deal of such work to be done. Now, just here lies an argument that I have never yet found any one able to answer. Perhaps you can. How is this work to be done? We are not a very patriotic people. Men will not do this work without pay, and I see no way of paying them save to provide them with places under Government.' Now, this may not seem to us a very telling argument; yet the fact that an educated and well-meaning man, who sees the enormous vices of our present system, considers it unanswerable, and in his experience has never seen it answered, makes it perhaps worthy of a formal reply."

Here we have put in a roundabout way the very question which the Duke of Wellington put to the House of Lords: "Suppose you select these clerks by competitive examination, and let them stay in office during good behavior, how is the people's government to be carried on? Who is to do the political work which has to be done if the government is to last?" Nor does one hear these questions from "broken-down clergymen" only, who may be fairly supposed to have lost heart and hope. They come just as freely from the lips of the large body of "practical men" engaged in the conduct of the political game, and they receive suggestions of change with the same air of amused incredulity and disgust with which, we may suppose, the old Duke would have listened to a young reformer's declamations on the advantages that would flow from the adequate representation in Parliament of Manchester and Birmingham.

Now, to get at the exact value of this question, we have to change its form a little, and ask what would happen if the whole body of Federal officials were to-morrow absolutely forbidden to do any electioneering work, and if the ups and downs of party warfare were made an object of absolute indifference to them. Well, in the first place, it being admitted, as we suppose it will be, that, when the time came to elect members of Congress, the proper proclamations would be issued, and the polls opened by the officers appointed to the discharge of these duties by law—does anybody suppose really that there would be in the different districts no persons either patriotic enough or enough interested in the return of a particular man to meet and nominate a candidate under these circumstances; that the whole community would be so absorbed in its affairs that ten men even could not be found to come together in a room to select and recommend somebody for the suffrages of the electors? Is it not absolutely silly to suppose anything of the kind? Does not everybody know that the political interest and activity of that vast proportion of the public who never expect either to hold an office or ask for one, are very great—greater than ever seen in any country in the world; that a very large number of persons are devoured by an idea which they wish to see embodied in legislation; that nearly everybody would either like to go to Congress himself, or has some friend or idol or instrument whom he would like to send there? The power of enacting laws affecting the great variety of interests which lie within the Federal jurisdiction is, in short, and will always be, an object of the eagerest ambition to every sect, class, and clique in the community. Take the tariff alone—to be able to manipulate it is something for which thousands of men would give months of labor and thousands of dollars. Do what you will, you can never create any field of activity possessing half the attractions for the great majority of the modern world which politics possesses. It is not only "the noblest of human pursuits," as Dr. Arnold called it, but the most seductive, and it becomes more so as the means of communication and of interchanging ideas become greater, and as the interests of society grow more complex. The number of people who care nothing about it is small everywhere—nowhere so small as here—and, indeed, the popular interest in it can only be killed by slavery or ignorance. There will, therefore, always be twice as many persons anxious "to run the machine" as can get anywhere near it, and we believe their number would be greatly increased if the office-holders and office-seekers were driven out of it, and confined to their desks. Their presence now repels people, because the work of electioneering is looked on as in some sort their professional duty, and their appearance in the field produces much the same effect on the political energy of private citizens that a large standing army does on their military spirit. Wherever there is a large body of soldiers kept up to do the fighting, the volunteers are sure to be few and languid.

But, it may be asked, who would do the drudgery and "the dirty work?" It would be done in part by self-denying, patriotic men and in part by paid rascals. A candidate, then, not being able to secure electioneering services by promises of offices, would have to be a man of more mark, and possessing a stronger hold on the sympathy or admiration of the constituency, than is now common. Having to rely largely on the efforts of volunteers, he would have to have something about his character or history to rouse the enthusiasm of volunteers, and nominating conventions would recognize this very speedily. They would be by no means ready to put up, as they now do so often, poor hacks or blatherskites, whom everybody suspects or despises, because they would know there would be no use in asking people to give money or work for them. But having put up a good man, who believes that they would have any difficulty in getting as much money and as many canvassers as he might need? Does anybody suppose that David A. Wells or George W. Curtis or Horace Greeley, to mention three well-known men, would be defeated for want of help in their canvass, even if they had not a single office in their gift? Why, even Banks and Butler would have friends, even if they had nothing to offer.

Then, as regards "the dirty work," we are not so enthusiastic or simple-minded as to suppose that there will not always be plenty of it to be done under any régime; but we do hope to see the day when it will be done, as we have said, by hired knaves—that is, when "managers," having dirty work to be done, will send for loafers and vagabonds, and tell them that if they will do this or that job they shall have—not the privilege of disgracing the country, and cheating the people, by a place in the Custom-house or Post-office or Treasury department—but so much in dollars and cents. If anybody maintains that this kind of labor cannot be procured in this way now, or that the time is near at hand when it will not be procurable in this way, he is welcome to his opinion; but he will not get us to argue with him.

And, as regards the "manager," or "man inside politics," supposing our reform carried out, should we need him? Of course we should. Nobody expects to see him disappear from the scene. All that we ask is to improve him. We want to mend his morals and his manners; to give him a little better education, a little stronger sense of moral obligation, a little more confidence in the existence of a public conscience. As long as party government lasts, his services can never be dispensed with. But it is the easiest thing in the world to make him more useful and more respectable. We have only to infuse more science into the game of which he is so fond. Instead of having him pass his time "taking care of his friends," satisfying "the claims" of a horde of poor adventurers and drunkards and broken-down people, and finding out how he can best turn them to account, or practising the art of writing and speaking sonorous and cloudy balderdash, we would fain teach him to study the real hopes and fears, needs and wishes, of the community, to appeal to what was highest instead of what was lowest in the popular character, and, if he did play on people's weaknesses, to play at least on their nobler ones. In short, we are content to have him really adroit and skilful, and even cunning; but a transparent, and weak-minded, and easily-detected cheat and humbug, such as he is now, we cannot bear with any longer. When he is going to "make capital," we insist on his doing it in some retired place or in the night, and not in open daylight, under the very noses of those he wishes to impose on; and if, like Macaulay's Brahmin, he insists on sacrificing mangy dogs to his gods, he must not have the impudence to ask the bystanders to believe that the victims are good sound sheep.

To hold, in short, that the present system is necessary to popular government or party government, is to hold that popular government is a failure. Nobody believes in his heart that any government can last under such a system long; there are stump orators who say they believe it, but what they really mean is that they believe it will last their time, and that it serves their purposes very well. What is worst is, that if you prove the present mode of office-filling and office-holding to be necessary to democracy, you force every man who believes that democracy, like every other political arrangement, is but a means to an end, and that end the establishment on earth of truth and justice, to pray that it may speedily perish, and make way for the better things which all who have faith in God's goodness must surely look for. That the Almighty intended the crown and consummation of man's strivings as a social being to be a system administered in its details by liars, thieves, shysters, ignoramuses, drunkards, adventurers, and "fast" men, is a doctrine which, we are glad to say, we are not "educated up" to, and any party paper which is engaged in the work will, we promise it, find it a thankless task.

THE PAPAL QUESTION.

Nobody who remembers the interest or even anxiety with which the meeting of the Œcumenical Council at Rome was anticipated by the Christian world could have believed that the Council would be broken up, and the Pope be declared infallible, and deprived of his temporal sovereignty, and all within a year, without attracting much notice either from the faithful or the heretics. Indeed, there could hardly be a more striking illustration of the extent to which politics have been "secularized" in Europe than the small amount of attention which even the Catholic powers are according to the Holy Father and his misfortunes. Gambetta, Jules Favre, and Bismarck occupy men's thoughts almost to the complete exclusion of the Vicar of Jesus Christ, and there has probably been no time in the history of the Papacy when people showed so little care for what the Pope said, as the very moment when it has been authoritatively declared impossible for him to err in his sayings.

Considering, too, the long fight there was over the great dogma, it is almost marvellous to see how little pains the public has taken to follow its fortunes since its promulgation. And yet, the proceedings which have followed this promulgation have been in many respects as curious as those which preceded it. There were said to be in the Council, in the earlier stages of the discussion, about eighty bishops hostile to the dogma, but, before the close, the opposition had dwindled down to about forty-five. As soon as the adoption of the dogma seemed certain, the question, What would the minority do? became one of the greatest interest, because on this the effect of the performance on the Catholic Church would in a great measure depend. Those who were deeply impressed by the high character of the leaders of the minority, including such men as Schwarzenberg, Rauscher, Ketteler, Clifford, Hefele, Strossmayer, and Kenrick, felt certain that they would hold out, and that we should have an ecclesiastical convulsion of the first magnitude. Those, on the other hand, who were deeply impressed with the church discipline, and the enormous weight with which it weighs on individual minds, were satisfied that they would give way and eat humble-pie. Neither have proved quite right. Eighteen German bishops, comprising some of the most important members of the minority, have met at Fulda, and issued a pastoral, warning the faithful that the decisions of the Council are "divinely revealed truths," and must be accepted as such by those who "wish to be and remain true members of the One Holy and Apostolic Church." The majority of the minority, however, have thus far given no sign; and, while it is certain that some of them will submit, it is believed that the others will not.

Those who have made their submission have drawn down on themselves a castigation at the hand of Lord Acton, an English Catholic peer, better known as Sir John Acton, who, much to the chagrin of the Papal authorities, took up his abode at Rome during the sitting of the Council, and made his rooms the headquarters of the opposition. He was in reality a sort of informal envoy of the various Catholic powers, as well as of his own Government, and made reports to them from time to time of what was going on, but he was, we believe, obliged to forward them to their destination by hand, owing to the peculiar views of the Papal police as to the sanctity of private correspondence, and for a similar reason had to keep his private papers elsewhere than in his own rooms. He was, however, a man of too much weight to be summarily packed off, and so he stayed there, supporting and animating the bolder, and encouraging the more timid, members of the minority. Finding himself now abandoned by a large number of his clerical allies, he has done a very cruel thing in writing a letter, addressed to a German bishop, in which he says that the Catholic world honors in the minority of the fathers of the Council the true witnesses of its belief; but complains that now when the hour of "critical decision" has come, "the wished-for direction" has disappeared—that is, the bishops give no sign, or else recant. He, therefore, by way of showing what a "disturbing contrast" there is between their language at the Council and their conduct now, cites a number of extracts from their letters and speeches during the discussion of the dogma, and notably nineteen expressions of opinions of bishops, taken from the "Synopsis Observationum," drawn up by the official reporter. These are, to the carnal eye, horribly damaging. Any man who talked this way last spring, and now adopts the dogma, must be held by men of the world to be either knave or fool. There is, however, another way of looking at them which we venture to say will be generally adopted in the Church, and the success and antiquity of which afford a remarkable illustration of the skill of the various contrivances by which she protects herself against rebellion and schism. The stronger the ground bishops took against the dogma, the more meritorious, it will be said, is now their submission. A pious man, far from being discouraged by the strength and absoluteness of his opposition to the dogma and to the competency of the Council to adopt it, will rejoice over it as making his retractation all the more striking as an act of faith; so far from blushing to own himself an imbecile, he will jump eagerly at the chance if, by so doing, he can promote the honor and glory of his Holy Mother. This is the ecclesiastical way of approaching the difficulty, and it is one with which, it must be confessed, it will prove somewhat difficult for the lay mind, and even for the Catholic lay mind, to deal.

Lord Acton has, however, been met by the Bishop of Mentz, and by Bishop Ketteler, in a way that is purely mundane, and reminds one of the conflicts which so often rage between the heroes of the caucus and convention. The Bishop of Mentz, in the first place, accuses him of garbling his extracts, and with incorrectly reporting some of the proceedings; and then comes Bishop Ketteler, and accuses him of telling "an untruth in an unexampled manner;" he says his letter is "crammed with untruths," and he more than hints that his lordship had something to do with the composition of "the lying stories of the *Allgemeine Zeitung*." Considering the nature of the occasion which has called these charges and counter-charges forth, and the elevation of the atmosphere in which the disputants are supposed to be moving, even a "politician" might read them with amazement.

The course of events at Rome is not less surprising. The Pope, two years ago, included by the "Syllabus" attached to his Encyclical Letter all doubts about the legitimacy of, or attacks on, his temporal sovereignty among the offences for which a man exposed himself to everlasting damnation. The reason for attaching this tremendous sanction, however, to the arrangement by which the Pope reigned at Rome was a purely utilitarian one, and made it very difficult, if not impossible, for most laymen to see anything sacred in his sovereignty. It would not do, of course, to say that Christ had made Rome the seat of the government of his Church, because, had he done so, he would undoubtedly have provided some better means for its protection than the arm of flesh, as embodied in Zouaves or gendarmes. So it was said that it was necessary for the free exercise of the Pope's spiritual sovereignty that he should be the temporal monarch of the spot on which he received the faithful. This, of course, put the matter on very low ground, and left it open to the Italians to say, as they have already said, that they would provide means of securing his independence just as effectual and far less costly and troublesome. So they marched into Rome, and now propose to declare him and his suite and his aides and his palace inviolable, and to leave him the patrimony of St. Peter in Rome, and to take measures with the other Catholic powers to provide him with an ample revenue. If he says that he cannot be free in this way, they reply, "Try it; we offer you better guarantees than you have ever possessed." He refuses to listen to them, however, and has shut himself up in the Vatican, and persists in treating himself, and praying for himself, and having himself prayed for, as a prisoner—though nothing would please the Italian authorities better than to have him rove about. They have, however, taken full possession of Rome, abolished the laws of mortmain, and removed one of the grand scandals of Christendom—the shame and reproach of the Papacy—by admitting the Jews to equal civil rights. The "Ghetto" passes at last into the lumber-room in which so many mediæval horrors are stored. These unfortunate men were, under the law of the Vicar of Jesus Christ, incapable of testifying in the courts; could not possess real property; could neither attend schools nor colleges; and, besides a number of other restrictions, were forced to live in an unwholesome den, apart from all the rest of the population. So deep a stain on the Christian name has at last been removed; and when we find that this great act of justice and humanity had to be performed at last by the royal libertine who occupies the Italian throne, in the teeth of surly and cursing bishops, we can hardly wonder that the educated classes of the kingdom are, almost to a man, scoffing materialists.

A NEW POLITICAL PROBLEM.

THE constitution of Michigan confers the electoral franchise only upon white male citizens of the requisite age, and upon some exceptional Indians. At the late election, an amendment, striking out the word "white," was submitted to the voters, and adopted by a small majority. While the fate of it was still doubtful, certain Republican journals pronounced its defeat to be of no practical importance, and declared that a different result would have had a moral value merely. The position, however, in which this would have left Michigan—the actual position of several other Northern and Western States, as well as of Maryland and Kentucky—involves a matter of grave moment to each of them, and suggests a new problem of constitutional construction whose solution may be equally undesired and unexpected. We purpose to state the problem, and to make a few suggestions as to its solution.

Soon after the adoption of the Thirteenth Amendment, it was discovered that an enormous political inequality among the various commonwealths was produced by the change. The slaves having become freemen, the number of representatives in Congress must be based upon the total population of each State; and, as the voting right was generally withheld from the blacks, the whites had thereby obtained an accession of political power, and this was notably and most inequitably the case in the former slave States. The natural and direct remedy would have been another alteration of the Constitution, extending the franchise to the colored man, but fears were entertained that the people had not yet quite come up to this point. The attack was therefore made upon the clause of the Constitution which regulates the apportionment of representatives in Congress. The result, as is well known, was the Fourteenth Amendment, which declares, among other things, that, "where the right to vote at any election for the choice of . . . representatives in Congress, the executive and judicial officers of a State, or the members of the legislature thereof, is denied to any male inhabitants of such State, being twenty-one years of age and citizens of the United States, or in any way abridged . . . . the basis of representation therein shall be reduced" in a given proportion. There is no doubt as to the meaning and intention of this article. It was aimed directly at the States, and contemplates State action exclusively. Its purpose was to force them severally to confer the vote upon the negro, by holding up a diminution of representation and a consequent loss of power and influence in the National Government, as a penalty in case of refusal. If a State which had admitted the white man alone to the ballot-box should neglect to change its fundamental law and its legislation based thereon, so as equally to admit the colored man, Congress must apply the political penalty, and impose the punishment by proportionately lessening the number of its representatives. Although addressed to the whole country, the new rule was to be felt most powerfully at the South. For this reason, the rebellious States, upon the re-establishment of their normal relations with the nation and its government, adopted constitutions in which no distinction is made between whites and blacks in respect to the right of voting. Subsequently the Fifteenth Amendment was proposed and ratified. It should be carefully noticed that this last utterance of the people's will does not in affirmative terms declare who shall be voters, but prohibits the States from abridging the right of citizens to vote on account of race or color.

The problem we suggest is, whether the latter article repeals or modifies the former one by implication? In other words, whether a State which, by its own organic law and its legislation, persists in granting the electoral franchise to its white male citizens alone, may still avoid the penalty prescribed by the Fourteenth Amendment, and be admitted to a full representation in Congress? The solution of this problem is not altogether free from doubt, but we think that the reasons for a negative answer to the question greatly predominate. At all events, the subject is one of great interest, and should engage the attention of Congress in the apportionment which they will soon make.

In the first place, a repeal by implication is not favored, and is never allowed unless the repugnancy between the two enactments is so complete that the former cannot stand beside the latter. There is plainly no such repugnancy here. All the provisions of both amendments may be fully carried out without the least interference. But if this suggestion appears to be too technical, there is another, which goes to the bottom of the matter. Taking all the clauses together, the intention seems to be plain. The Fourteenth Amendment addresses and commands the States; the denial or abridging of the right to vote spoken of is to be an act of the States; and the penalty inflicted is a consequence of that act. The truth of this proposition is self-evident. The Fifteenth Amendment does not profess to sweep away these former provisions, nor does it, by virtue of its adoption, repeal or abrogate any State legislation opposed to it. What, then, was its object? The answer is plain when we consider its peculiar language. Its design was simply to permit legislation of Congress which will admit the colored man actually to the ballot-box, notwithstanding the bar which the States may have placed in his way. The Fourteenth Amendment did not accomplish this result directly, for a State might prefer to resist, and to suffer the deprivation of political power. But now Congress is authorized to pass laws guarding the right of the negro to vote, and opening his way to the polls, by personally punishing State officers and others who interfere, and by taking an actual control of the voting process. It would seem to be plain, therefore, that the Fifteenth Amendment neither repeals the Fourteenth nor abrogates the local constitutions and laws. On the contrary, reading both articles together, we find that two penalties instead of one are now affixed to the contumacy of a State—diminution of its representation in Congress, and liability of its officers and citizens to personal punishment and loss of its absolute control over elections held within its territory.

If it should be urged that, since the ratification of the Fifteenth Amendment, the right of no person to vote is denied or abridged on account of race or color, because all may vote irrespective of race or color, the ready answer is, that this result is, if true, not brought about by State action, but by national action, and the restrictive clauses of the Fourteenth Amendment are aimed at this very absence of State action. But the proposition contained in the objection we are now considering is not true. We repeat, the last great change in the organic law does not *ipso facto* repeal or abrogate any portions of State constitutions or legislation; it only clothes Congress with authority to relieve negroes from the restraints of these constitutions and that legislation. The State, as far as it can by the utterance of its own will, prohibits negroes from the exercise of the electoral franchise, and thus "denies" the right. Were it not for the acts of Congress carrying the Fifteenth Amendment into operation, this attempt would be successful. But the "abridgment" of the right is something more than mere words. The State, in the most formal manner, says that the colored man shall not vote; he must therefore appeal to the national laws to protect him, and perhaps call in the aid of the national courts and executive officers in order to force his way to the polls. This very fact, that Congress must pass a statute to avoid the constitutional provisions and special legislation of a given commonwealth, shows that the free voting right is actually "abridged" in such a community. Other instances of constitutional restrictions confirm these positions. Thus, the States are prohibited from passing laws impairing the obligation of contracts, and are forbidden to deprive any person of life, liberty, or property, without due process of law. These general restraints do not of themselves repeal and abrogate any State statutes which are obnoxious to their mandates; they only furnish a rule of judgment to the courts, and enable the national judiciary to grant final relief to a suitor; the statute still remains as an expression of the local legislative will. The conclusion which we reach is that, if a State by its constitution and laws confers the electoral franchise upon white male citizens alone, it does deny and abridge the right of colored citizens to vote, and is thereby liable to have its representation in Congress diminished, notwithstanding the means of protection now extended to the negro by the collective authority of the nation.

If these views are correct, and we see no escape from them; if it be true that the penalty of the Fourteenth Amendment is not uplifted by the negative clauses of the Fifteenth; then it is plain that the failure of Michigan or of several other Northern and Western States to remodel their constitutions and laws is a matter of the greatest practical importance to them, and has far more than a mere moral influence and value. In fact, it subjects them all to a loss of representation in the new apportionment about to be made on the basis of the recent census. The effect will doubtless be more serious in Maryland and Kentucky, where the negroes form a considerable portion of the population, but it will be perceptible at least in other States. We will add that New York has not escaped from the unfavorable consequences by means of the statute passed by its last legislature, because, as its constitution still limits the right of the negro citizens to vote, that statute is, so far as the local constitution is concerned, utterly null and void. In conclusion, we would commend this subject to the careful attention of the Congress which shall reorganize the House and apportion the representatives. Perhaps some of the Southern States may not feel unwilling to apply to their Northern brethren the same stringent rule which was once forced upon themselves.

AFFAIRS AT THE UNIVERSITY OF MICHIGAN.

ANN ARBOR, Nov. 28, 1870.

SOME of us who are, as Roger Ascham says, "lookers-on in this cockpit of learning," please ourselves with the fancy that there may be here two or three things working themselves out of which your readers would like to have just now a brief account. We try very hard not to be deluded by too fond an estimate of our importance in the system of American colleges, or of the value which Eastern educators will be inclined to attach to our experiments at making a university. Indeed, we are often fearfully depressed in spirit by recollecting that New England and New York look to Michigan and Illinois for corn and pork rather than for ideas. We chafe and mortify ourselves, also, under the necessity, from which nothing less than a miracle or a trans-continental canal can rescue us, of being for ever classed in Dr. Holmes's dreadful category of "fresh-water colleges." Besides, the moment we try to forget this, and to speak of ourselves as though we seemed to deserve some attention at Cambridge or New Haven or New York, at once some of you people that way are pretty sure to intimate to us that your experience coincides with that of Serjeant Davy, who said, very neatly, that "the farther he went to the West, the more was he convinced that the Wise Men came from the East." Of course, we are greatly edified by *your* modesty in all this; and we naturally bow our heads.

But, not to stay any longer on this perilous subject of sectional comparisons, I hasten to say a few words on a subject far more agreeable, though possibly not any less perilous—the ladies. As you must be already aware, they have come. "The Ever-Feminine draweth on," said Goethe. There is a tincture of futurity in his phrase, which, so far as our university is concerned, must now give way before the heroic force of the realized present. The "Ever-Feminine" taketh up its abode among us. The most numerous masculine community of students in America has been exposed, since last January, to all the horrible risks of being present at lectures and recitations with women, and that, too, in studies which an old English poet took pains to describe as "unmeet for women's imbecilities." I venture to say that no revolution in affairs ever crept in so noiselessly, or ever wrought its effects with so much peace, as this has done with us. Had a great crowd of strong-brained ladies rushed in upon us, the moment the doors were thrown open, it might have been different. As it was, the new régime was represented for several months by but one young lady, who most fortunately was well fitted, both by scholarship and by manners, to conciliate for the new order of things the approbation even of reluctant minds. True, she was more than a nine days' wonder here. Not even Joyce Heth, or the Mermaid, I fancy, was ever stared at more vehemently than was our first lady sophomore for a while. But she bore it admirably, kept quietly about her work, made capital recitations whenever called upon, and enabled the most obdurate of us in a few months to conquer our prejudices. So the battle was won for her whole sex. Accordingly, this fall, when along with a thousand young men there appeared on the ground about thirty young women, who distributed themselves among the three departments of law, medicine, and literature, the "fresh-water" of our inland college life was scarcely disturbed by a ripple. The whole affair, thus far, is a triumphant exemplification of the merits of the *laisser-faire* principle in the solution of a vexed and vexing educational problem.

It must be confessed that our university has peculiarities which have rendered it comparatively easy for us to engraft the epicene system upon the former plan. Perhaps the foremost of these peculiarities is our freedom from the institution of dormitories and from the types of habit and sentiment among students which that institution breeds. For some years back, this university has positively declined either to keep a boarding-house or to take in washing, or even to have unfurnished apartments to let; and, consequently, all its members, finding their homes among the families of our citizens, are kept in constant contact with the normal life of civilized communities of men and women. Furthermore, the university is not an establishment sundered from the rest of the world by any sort of gulf, local or moral. It stands in the midst of this pretty town, on a square *campus* of forty acres, surrounded on all sides by private residences; and through its pleasant walks, as through a city park, ladies and gentlemen and even children are frequently strolling. The sight of feminine apparel, therefore, among our buildings, in the museum, in the library, and even in the lecture-rooms, has long been a familiar one. In fact, the university, by position and custom, has so perfectly blended with the general community and is, indeed, so indistinguishable from it, that the presence of ladies in the former seems quite as natural as is their presence in the latter.

You do not wish me now to turn prophet, and tell you what will be the results of the new system ten years hence. Rather let me keep within the limits of what I know, and try to testify concerning the effects, whatever they may be, which are already visible after this trial of the plan of coeducation for so short a time.

First, concerning Conduct.

In the medical department, the ladies are entirely separated from the gentlemen in lectures, at the clinical illustrations, and in the dissecting rooms; and after repeated enquiry, both among students and professors, I learn that all is and has been quiet on that usually rather stormy Potomac. Not one uncivil or disobliging act has been committed by the male "medics" towards the dames and damsels who are studying in the same building to be their professional rivals. And let no one suppose that this abstinence on the part of our young men is owing to any particular mildness in them, or that our "medics" are not as other "medics" are. It is attributable, doubtless, to the sincere wish of the professors in that department to give the ladies a fair chance, and especially to the judicious arrangements which they made at the outset for accommodating the new-comers.

In the other departments, namely, of law and literature, the ladies attend all university exercises with the gentlemen. Our young men are a loud-lunged, a hearty, and a jubilant set of fellows; and, so far as I can see, they are in no respect subdued by the presence of their fair fellow-students. They still indulge, on occasion, about as usual in cat-calls and whistling and the rollicking horse-play so natural to a huge crowd of masculine persons free from care, in good health, with a tyrannous perception of the ludicrous, and fond of lingering on the foggy confines of big-boyishness. At the same time, in anything which directly concerns the ladies—their convenience in sitting, or in passing in and out of lectures and recitations, there is a very perceptible and never-failing chivalry; and I am sure that were a rude act to be done to any one of these gentle disciples it would be swiftly avenged, in the most direful manner, by the whole body of the students. We think that in all this we already see an influence that is worth having, bearing steadily in the direction of raising and refining the tone of manliness, without in the least weakening it. There is still among us, undoubtedly, a generous supply of boorishness; but it shows some cheering symptoms of intending to try to get up its first blush.

But how about Scholarship?

Still trying to be historical rather than prophetic, I have only to say at present that on all hands comes in testimony from our professors that on these grounds better recitations have never been made, and in the severest studies, than have been made by the ladies. So far are they from injuring scholarship here, that by their earnestness and fidelity they are, if anything, stimulating it; and their presence is beginning to give to all utterances in the class-rooms just that delicacy, that civil, chaste, and humane tone, which the recognition of women among the readers of books has been giving to English literature during the last hundred years.

Upon the whole, though very few persons in our faculties desired the arrival of the girls among us in this capacity; though, in fact, most of the professors accepted the situation as they would the inevitable; yet I am unable to hear of one of them who now regrets it. We do not affirm that the experiment has yet proceeded far enough to be entirely conclusive. For ourselves, we shall still wait and watch—but no longer with any fear. Meantime, the general opinion upon the present state of the case is very fairly conveyed in the verdict which I heard last night from the lips of one of our most thoughtful and most conservative men: "The coming of the women among us," said he, "is not only a success, but a success to a degree wholly unexpected." Unless, therefore, some now unseen flaw shall appear in our machinery, it certainly threatens to conduct the idea of coeducation to a success that will be contagious; and should this be the case, I do not see what power can avert from the generations of men the calamity hinted at in Young's most ungallant lines:

"Is't not enough plagues, wars, and famines rise
To lash our crimes, but must our wives be wise?"

I had intended in this letter to refer to several other topics. But, as you see, in trying to tell you about the ladies, I have not succeeded in being brief—thus illustrating once more the sad truth that when one gets entangled with these irrepressible members of the human family, there is no safe guess as to when one will get clear again. M. C. T.

Correspondence.

OLD YALE ON "THE FIRST ALUMNUS"—A CARD FROM THE REV. MR. PICKERING.

To the Editor of the Nation:

Sir: Mr. Pickering, of Squashville, presents his compliments to "The First Alumnus" in the *Nation*, and requests that gentleman to be a little more careful in his representations about what people have said, and not to trouble himself or the public with the unimportant and irrelevant question whether Mr. P. is or is not a "former editor of the *Independent*." If everybody who thinks that the hebdomadal so-named is managed on the principle commended by Mr. W. W. Phelps as "an absolute condition of earthly success"—the principle of "catering to human weakness and infirmity"—must be incontinently set down as "a former editor," the catalogue of former editors will become inconveniently voluminous.

That Mr. Pickering is "a clerical member of the corporation" can hardly be denied, for that fact was openly proclaimed by so eminent an authority as Mr. Phelps, in his speech at the commencement dinner, and is as openly professed on the first page of the letter from Squashville and the last. That he is a "polemical" member may, perhaps, be inferred without any blamable temerity from the fact that, when the venerable body of which he is an unworthy member was publicly insulted by men professing to represent "Young Yale," he volunteered to repel the insult. But the attempt to divert attention from the question by guessing which one of the ten clerical fellows accepted the insult for the rest, and replied to it, is as irrelevant and (not to put too fine a point upon it) as uncivil as if some one should attempt to guess out and publish the personality of "The First Alumnus" and the second.

The intimation that the clerical fellows of Yale College, in declining to abdicate their trust and to put the institution afloat without any shadow of security for its continuing to be a Protestant Christian institution, occupy a position like that of the Tract Society in Nassau Street a few years ago when it refused to publish a word against the vital godliness of one man's assuming to own another man's wife and selling her to the highest bidder—is too preposterous to be refuted. Has anybody pretended that this demand for the subversion of the entire constitution of Yale College is set up in the interest of Christian morality? Is it pretended by "The First Alumnus"—or even by the second—that the ancient charter, or the administration under it, is anti-Christian and offensive to the moral sense?

The strictures of the *Evening Post* not having come under Mr. Pickering's notice, he cannot reply to them; but he may say that he has not made Mr. Phelps responsible for either of the two writers in the *Nation*, nor "The First Alumnus" for the second. He had to do with a demand for what he now finds denominated "a reform at Yale College"—a demand made in the name of "Young Yale." He found "Young Yale" represented, and its demands articulated, first by Mr. Phelps, then by "The First Alumnus," professing to sustain Mr. Phelps and to elucidate his meaning; then by another Alumnus, professing to agree with both, and to set forth the ideas of "Young Yale" still more explicitly. If Mr. Phelps was misrepresented by "The First Alumnus," or if they both were misrepresented by "t'otherest governor," Mr. Pikering is not responsible for the misrepresentation. He is not aware that he made any confusion in his quotations, or in any instance imputed to any one of the three what had been said by any other. He was dealing with "Young Yale," as represented by all the three, among whom the chief difference was that the second was on one point a little more explicit than the first, and the third a great deal more explicit than both.

Mr. Pickering is sorry to find his use of the word "fool" entirely (if he should say *innocently*, he might give additional offence) misunderstood by "The First Alumnus." If, in alluding to the Bible proverb, "Answer a fool according to his folly, lest he be wise in his own conceit," he called those two writers in the *Nation* "fools," he had already called himself a fool in quoting from the Apostle Paul, "Am I become a fool in glorying?" Having been betrayed into the folly of glorying in the pre-eminence of his own profession, he excuses himself by adverting to the equal folly of the assailants of his profession. If "The First Alumnus" had not (as he now says he had not) assailed the clerical profession as inferior in talent and culture to other professions, he knows who had done so in the name of "Young Yale;" and he knows also that the word "fool" was not used by Mr. Pickering as characterizing anything else than the assault on the intellectual character and standing of Christian ministers and the defence of the clerical profession against that assault. He says, "President Woolsey proposed a change in the charter," and thereupon asks, "Is he also a fool?" He seems to forget that President W. is himself a Christian minister—one of the profession which "Young Yale" despises and defames. He says, "Mr. Pickering tells us we are 'fools' for not allowing 'the venerable institution to remain where the founders placed it.'" Mr. Pickering takes the liberty of saying that in this statement "The First Alumnus" "greatly misrepresents" the matter. Either the professor of logic or the professor of ethics ought to be censured for permitting any alumnus to graduate who can make so gross a misrepresentation.

Mr. Pickering requests that all persons who find themselves called to discuss his letter will remember *what the question is* which was raised by Mr. Phelps in the name of "Young Yale," and agitated by "The First Alumnus" and the second, both professing to represent the same "Young Yale." The question is not concerning that change of the character of Yale College which was suggested by President Woolsey some years ago, and was equivocally reported on by "the Committee of 1869;" it relates to a much more important change which President W. never suggested. It is not whether the six State senators in the corporation shall be superseded by as many men chosen in some other way. That question, extremely difficult and delicate in itself, has been made ten times more difficult by the "worldly wisdom" of "Young Yale," so much wiser than the "saintliness" of Old Yale. Men of only ordinary sagacity would have said to each other, "Let us take care not to alarm the ministers or the churches till we shall have got rid of 'the Hon. Mr. Domuch' and his colleagues." But the more than ordinary sagacity of "Young Yale," instead of waiting for the solution of the question raised by President Woolsey and reported on by the Committee of the Alumni, has raised a very different question, and has thrown the original question into the shade. Mr. Pickering takes no great interest in the former question, and, therefore, declined to consider it. The one subject of his letter is that other and graver question thrown into the arena by the "worldly wisdom" of Mr. Phelps and the two writers in the *Nation*, namely, the question about a plan "*to abolish the existing corporation and to place the legislative and appointing power of the university, and the custody of its endowments, in the hands of a board or council chosen by the annual mass-meeting of the Alumni.*"

Mr. Pickering can see no good reason why the gentlemen who propose this plan should not frankly discuss the question of its desirableness and its feasibleness. Let them remember that the question which they have raised is not whether clergymen outside of Connecticut—in New York, or Cincinnati, or San Francisco—shall be eligible as fellows, nor whether laymen shall be eligible, but whether the absolute control of the university shall be given over to mass-meetings of graduates, electing at their unlimited discretion the members of a new corporation. Thus far, the self-constituted representatives of "Young Yale" have not "catered" very adroitly to the "human weakness and infirmity" of the ten clerical fellows, but Mr. Pickering presumes that the "worldly wisdom" of those who contrived the plan has not forgotten the necessity of commending it to the judgment of practical men by showing what will be the consequences of adopting it and of circumventing in some way the old ministers, without whose consent it cannot be adopted.

OLD YALE TO THE "FIRST ALUMNUS."

SIR: As you have left your readers in ignorance of your name, and I am, therefore, unable to address you privately, it will not, I presume, be deemed improper if I offer, in a more public way, a few suggestions in regard to your article in the *Nation* of Nov. 24 on the Yale College Corporation. I have no desire or design to take part in the controversy which has been going on of late in that paper. There are enough engaged in it already without any assistance on my part, and, so far as my own opinion is concerned, I do not look upon any of the New York papers, even the best, as the place most suitable for such a discussion. I have no quarrel with you, however, if you think otherwise on this last-mentioned point, and I have no wish to have any quarrel in regard to the great subject itself.

But I trust you will pardon me if, in all friendliness, I say that it seems to me unfortunate—whichever side in this matter may be right—that those who favor a change in the corporation should not inform themselves more accurately respecting the facts of the case before they write for the papers. Misstatements of facts are an injury to the cause which a man advocates. Where they are such misstatements as a little investigation would lead one to avoid, they inevitably will appear to interested advocates on the opposite side to be intentional perversions of the truth, and to all persons who are cognizant of the facts they will seem unpardonable because they might be so easily avoided. The writers on your side have fallen into such misstatements: as, for example, one of them, who has even reprinted his newspaper article in a pamphlet, asks why, if the corporation *must* consist of clergymen, eminent clergymen are not appointed, and then gives as examples Dr. Bushnell and others, including the name of one gentleman who had been a member of the corporation for several years! That writer had not even examined the college catalogue enough to know who the members of the corporation were, and, of course, everybody laughed, and a considerable portion of his argument vanished in the ridicule.

I beg leave to call your attention to some points in your article of yesterday.

I. You say in that article (*Nation*, Nov. 24), "Cannot the present corporation see why Mr. Sheffield, Mr. Peabody, Mr. Street, and Mr. Phelps placed their donations beyond its control?" This question might be a somewhat weighty one if it were founded on fact, but, unfortunately for your argument, it is not thus founded. The donations of Mr. Street and Mr. Sheffield—the former the largest in amount ever received by the college, and the latter (considering its results) perhaps the most valuable one ever made—were placed by the donors altogether in the hands of "the present corporation." These gentlemen had been residents of New Haven for many years, and had had every opportunity for knowing the management of the college, and yet they did not hesitate to commit their hundreds of thousands of dollars to the existing board. The weight of their testimony—which is, manifestly, even to your own mind, very great—is all on the side of the corporation, and not, as you seem to suppose, against it. To cite their cases, therefore, in your favor, must strike your adversaries as bold beyond measure, and must impress all others who know the facts as indicating on your part an ignorance of those facts which a person engaged in the controversy ought to have removed by informing himself accurately. The case of Mr. Peabody, also, is not as you put it. Mr. Peabody had no unwillingness to place his funds in the hands of the corporation. He had never raised the question of their competency; but, as I have been informed by one who was active in connection with that matter or wholly acquainted with it, he was persuaded to adopt the course he did by other persons, who, for wise and sound reasons, wished to have the direction of the building of his museum. Everything which he did under their influence was done in entire harmony with the feeling of the corporation, so far as I have ever heard, and, except for those influences, he would have given to the corporation itself. In regard to the case of Mr. Phelps, I am not fully informed, but, if I mistake not, his will gives the property to the corporation after the death of his son, only allowing his son the right to designate the particular object in the college to which it shall be devoted. As for the reason why Mr. Phelps left the principal under the control of his son during his lifetime, I do not know what it was. I think there were probably other reasons existing in the case which induced him to take the course he did—one or two of which might be suggested were this the suitable place to present them. But even admitting that he distrusted the capacity of the corporation to manage funds, his case is one which will have little weight with your opponents, or with any who are not previously prejudiced in favor of your side, because they will say that he was, undoubtedly and naturally, influenced by his son, who is a publicly pronounced opposer of the existing corporation. The fact is, my dear sir, that, whatever distrust of the fitness of the corporation for their work may exist in your mind, or in the minds of a few or a great many others, there has been none, thus far, in the minds of the great givers. Men who have given four or six times as much as Mr. Phelps did, and who have seen the college for years, and known its trustees, have had no hesitation about the safety of their gifts, or the wisdom with which they would be cared for, in case those gifts were left in the hands of the clerical gentlemen of whom you speak. Since this controversy began, and since these expressions of distrust first found utterance, more has been donated to the corporation for the college than ever before in ten times the number of years. Surely, then, it is unwise for your own side in the argument, and it will be regarded by all unprejudiced persons as unfair to the other side, if you bring forward such statements as those involved in the question to which I have now called your attention.

II. You say, again, in your article, "The Committee of 1869 favor the change." If you will examine their report, you will confess, I think, the incorrectness of this statement. Their language is, "As to the more important question whether the proposed change is desirable, the committee express no opinion, for the reason that they are not agreed in opinion. They must leave it, therefore, for the graduates to decide whether it is advisable to recommend a change, concerning the advantages of which the committee hold a divided opinion." They add: "The committee are *unanimous* in finding no reason to recommend this or any change for any special defect in the government or administration of the college. *There is no reason to believe that the funds of the institution would have been more carefully guarded or faithfully expended, or that the discipline and instruction of the college would have been more satisfactorily administered, under any different constitution of its corporation.*" In the light of this plain language, and of what is well known as to the opinions of all the members of the committee, your opponents—not to say all who are not partisans with you—will say, The man who wrote that article has not even read the committee's report, and is in profound ignorance of their views. Such mistakes—so easily avoided—certainly injure the cause they are intended to aid.

III. You say further: "We have reason to believe that a considerable portion of the faculty, not under the control of the corporation, would welcome the change." If you mean by this statement to intimate that there is a portion of the faculty who are not appointed by and responsible to the corporation, you labor under a serious mistake. All the faculties of the several departments of the college are alike under the corporation. Every member of them receives his office from the corporation, and is answerable to that body for the faithful discharge of his duties. If, on the other hand, you mean to intimate that a portion of the faculty is so far under the personal influence of the corporation as to be properly said to be under its control, while another portion is not, you are equally in error. The corporation have not tried to influence, much less to control, anybody in this matter. There are no members of the faculty who, in either sense, are different from the rest. They are all alike dependent on the corporation for their appointment to office, and all alike free to hold whatever opinions on such a subject they may choose to hold. I can hardly understand, my dear sir, how a graduate of the college can have fallen into such a fundamental error as is evidenced by the language which I have quoted from your article. Your opponents will use these mistakes most assuredly to your disadvantage.

IV. You ask, further, whether the corporation cannot see "that either there will be no central, harmonious power to govern the university if this state of things continues, or that the Scientific School must be made to overshadow the Academic Department?" By "this state of things" you apparently mean the continued withholding of funds from the corporation, or the placing them beyond the control of that body, as Mr. Phelps, Mr. Peabody, Mr. Sheffield, and Mr. Street are stated to have done. The two results to which you refer are the want of any harmonious power to govern the university, by reason, as we suppose, of the existence of so many different boards of trust for the different funds given by different benefactors, and the making the Scientific School to overshadow the Academic Department. What effect this latter course which you predict would have on the present corporation, most persons familiar with the college will, I think, be unable to see. So far as I am able to comprehend your meaning, you seem, in this remark as well as in what you have said in regard to the portion of the faculty not under the control of the corporation, to have the idea that the Scientific School is an independent body existing outside of the college corporation. But, if this is your idea, it is wholly incorrect. The Scientific School was created by an act of the corporation, and is dependent on that body as truly as is the Academical Department. If the former were to overshadow the latter as much as the latter overshadowed the former when the former had been in existence but a year, the existing corporation would be in no sense interfered with either in their rights or powers. The two departments are united in one larger institution, which is all under the control of the same board of trustees. If either should grow to ten times its present strength, or if either should die away, the board would have the same control over the larger growth or the single surviving branch that it now has over both the branches alike.

V. Yourself and your associates seem to hold it as an established and admitted fact (see your first article in the *Nation*, for example) that your sentiments in this matter are held universally by the graduates of the last fifteen years; and that if the corporation do not, as you express it, "abdicate," Yale College will fail to receive to itself either the sons or the funds of the graduates. For one, I am free to say that I do not believe the fact to be as you suppose, nor do I believe the result predicted will follow. I do not believe that any considerable majority of the graduates of the last fifteen years care very much about the question, or have any desire corresponding with yours to change the corporation—any such desire, to say the least, as would make them *unwilling to give* to the college in case no change were made. I know that some of them do not agree with you at all in regard to the matter. You must remember, also, that the graduates of more than fifteen years' standing are quite as largely—not to say far more largely—on the other side of the question; and that they are the portion of the graduates to whom the college must naturally look, for a good many years to come, for the funds which are needed, because they, much more than the younger men, have property already acquired. Men grow conservative, too, as they grow older, and it would not be surprising if *some* of the younger men should change their views before their funds and their sons have progressed sufficiently to be in readiness to be given to the college. Mr. Walter Phelps, in his commencement speech, placed all of the graduates of over fifteen years' standing among the conservatives. The time will certainly be very brief before the younger graduates will have passed their fifteenth year of graduated life, and thus *may* have become conservatives themselves.

VI. It seems to me, since, as you intimate, the ministers must "abdicate"—that is, must be persuaded to give up their places in the board *of their own free will*, in order to the accomplishment of the change which you and your associates desire—it seems to me, I say, that a more persuasive and conciliatory style than the one which the writers of your party adopt would be better adapted to accomplish the end. Connecticut ministers—particularly those among them who pass their lives in Squashville—have as much humility as most men, and are as ready as ordinary Christians when smitten on the one cheek to turn the other also. But I must confess that it does not appear probable to me that the bold and public charge of incompetence for their work, or the threat that, if they do not resign their office, dire vengeance in the form of "no funds and no sons" will follow, will be likely to increase their willingness to abdicate. When the most humble and the most saintly men are pushed beyond a certain point, they sometimes become a good deal like those who are less saintly than themselves, and it is scarcely good policy to call them bad names or to tell them that if they do not mind what we say and give place, as they ought to, to wealthy and honorable gentlemen whom we can easily name, we will never give them any money to the end of time. They may turn upon us and say, Perhaps you would not give us any money, even if we followed your will. Some men of other professions, under similar circumstances, we are sure, would say, Give or not, as you choose, we are not going to be driven from our position by threatening language. At all events, my own experience has taught me this, and you will pardon me if I say it to you, my dear sir, that human nature in ministers is very similar to what it is in other men, and that the ends of persuasion are not often accomplished except by persuading.

My suggestions, as you will notice, have all of them reference to the manner and style of your defence of the side which you have chosen in this controversy. Of the merits of the controversy itself, I have already said that I have no wish to speak. My opinions, which may differ somewhat from yours, and also from those of the Rev. Mr. Pickering, are not of much consequence to the public; but I am quite sure that many of the graduates of Yale will sympathize with the suggestions I have offered for your thought, and I think that some among the graduates may be glad that I have offered them.

With much respect, yours truly,

X. Y. Z.,
Of a Class previous to 1855.

NOVEMBER 25, 1870.

[Interesting as this discussion is, it is rapidly becoming too voluminous for our columns, and we cannot, in justice to such of our readers as have no special interest in Yale College, let it go any further. We have been compelled to decline several other communications on the same subject, and, with the publication of one more, already in hand, on the "Young Yale" side, the debate, as far as the *Nation* is concerned, must close for the present.—ED. NATION.]

DOES PROTECTION PROTECT?

TO THE EDITOR OF THE NATION:

SIR: "E. A." in the last *Nation* expressed surprise "that the imposition of duties and the consequent increase of the cost of imported articles should cause such persistent controversy." He unconsciously gives an explanation afterwards in the assertion that American consumers of steel are obliged to pay "a duty of sixty per cent.," or $9,000 on each $15,000 worth used. I am buying from 90 to 120 tons of cast-steel yearly, and am interested in the article so far only as to wish to procure it as cheaply as possible, quality considered. I am quite unconscious of contributing so liberally to the support of the Government. Steel of the same quality costs me less now than in 1857 to 1861, when my supply came wholly from Sheffield. The tariff of 1861 raised the cost of steel and helped to establish its successful manufacture in this country: the domestic makers, in order to obtain a footing in the market, undersold their foreign rivals from the start, and still do so. I am using American steel almost entirely, yet I can, and sometimes do, buy Sheffield steel as low (in gold) as at any time since 1857. Plainly, "E. A." is wrong in his opinion of the effect of the present duty, and also, I think, in the rate, as a brief examination will show.

On steel, if it can be so called, worth three and three-quarter cents per pound, the duty of two and one-quarter cents is sixty per cent., but the same rate on steel worth six and seven cents per pound affords a duty of only thirty-seven and one-half and thirty-two per cent. Three cents per pound duty on steel worth over seven and not over eleven cents, and three and one-half cents per pound, with ten per cent. *ad valorem*, on steel worth over eleven cents, is forty-three per cent., if the lower limits are taken on which the percentage of duty is greatest: on steel worth ten and twelve cents per pound, the duty is but thirty and thirty-nine per cent., respectively.

M.

MIDDLETOWN, Nov. 30, 1870.

["M." has shown us his bills for the last ten years in proof of his assertions, but confesses his inability to say why competition between foreigners themselves should not reduce the prices of steel in this market as well as competition between foreigners and Americans.—ED. NATION.]

A WORD FOR THE PRESIDENT.

TO THE EDITOR OF THE NATION:

SIR: Is not the *Nation*, and are not certain other newspapers, too severe in condemnation of Gen. Grant's present course and relation with the party chiefs? I remember that when the President began his career as such, he undertook to govern in accordance with what seemed his own way of seeing things, and defied the party leaders. In consequence, he was made war on by the politicians, his friends who were true men, like Hoar, driven away from him, his favorite measures defeated, and his influence materially diminished. And there was no such expression of public opinion in support of his independence as there should have been. The whole country looked rather with amusement than sympathy on his dilemma, and the only remark one heard was, that Grant had undertaken too big a job in trying to govern without the advice and aid of the politicians. When he brought things to an issue in the case of Judge Hoar, and the Senate declared war on him, the country looked on in perfect apathy, and no indignant expression of public opinion came to encourage the President. He was left to fight *our battles* without support. Finding that he could not fight it through on that line without forces, he had no other resource than to fall back on the politicians, as he is now doing. Who is to blame?

Readers of the *Nation* know that I have no reason to speak well of this Administration, and if my whole story were told, they would say that I had great reason to speak ill of it; but justice demands, it seems to me, that the President should be credited with good intention in many cases where bad results have actually obtained. Nothing can be more explicit than the President's message on reform of the civil service, yet I have the highest Congressional assurance that no bill is likely to be introduced favoring any other reform than the abolition of a few useless consulates; and even this is doubtful.

That the President should desire a second nomination is perfectly natural—it is the endorsement of his first, which every public man in his position would desire; and since public opinion condemned his efforts to govern without the party leaders, he naturally looks to the leaders for the support which he desires. I have no personal knowledge of Gen. Grant, but when such a man as Judge Hoar holds his faith in him unchanged, as I know he does, I cannot believe that I am mistaken in the opinion that, if the public interested in pure and unpartisan government had in the beginning come out and supported him, we might have had a far better Administration than we can now hope for. I think that justice to a great man, whose reputation is our pride, should make us all admit this.—Yours truly,

W. J. STILLMAN.

PLAINFIELD, N. J., December 6, 1870.

MONOPOLIES AND THE FOURTEENTH AMENDMENT.

TO THE EDITOR OF THE NATION:

SIR: It becomes most of us to criticise with diffidence the opinions of our highest judges. But I think I am safe in suggesting a possible error in Judge Bradley's construction of the Fourteenth Amendment, given in the "Slaughter-house cases."

The provision of that amendment which seems to have governed the decision of those cases is, that no State shall make or enforce any law which shall abridge the privileges of citizens of the United States; and the court holds that the right to follow a particular calling is one of the privileges of citizens protected by that amendment. Now to me, at least, it appears clear that the purpose of the amendment was to protect the enjoyment of the privileges and immunities enjoyed by citizens of the United States *as such*—the privileges enjoyed by them, and by no one else—the privileges conferred by citizenship. To be sure, citizens have the right to slaughter animals. But how can the right be called a privilege of citizens of the United States, when aliens enjoy it equally with them? It is, I think, perfectly plain that the right to pursue a lawful employment, instead of being, as Judge Bradley says, a "sacred right of citizenship," has no connection with it whatever. It is, perhaps, a "sacred right" of humanity, but no more within the purview of the Fourteenth Amendment than the right to breathe the atmosphere.

H.

NEW YORK, Dec. 1, 1870.

Notes.

LITERARY.

MR. S. S. RANDALL, lately Superintendent of Education in this city, has written a "History of the Common School System of the State of

New York," which will be published in January by Messrs. Ivison, Blakeman, Taylor & Co. It is unfortunate that Mr. Randall's style is not what it ought to be to attract readers, to say nothing of what we might expect from a prominent school officer. He has a seemingly incurable fondness for long sentences, which at times do not permit one to see the end from the beginning on the same page. In the two octavo pages of the Introduction to the present work he has found a pretext for using but ten full stops, though needing about nine hundred words with which to express himself; and two consecutive sentences occupy exactly one page.

—Counting ourselves among the well-wishers of the South in all that concerns her future prosperity, material and moral, we have read with no little interest Prof. Francis S. Holmes's brochure on the "Phosphate Rocks of South Carolina, and the 'Great Carolina Marl Bed'" (Charleston: Holmes's Book House, 1870.) The marl bed was a very precious endowment to the State, but it has been quite overshadowed by the discovery of the extent and richness of the phosphate rocks, since the conclusion of the rebellion. Mr. Holmes, who was lately professor of geology and palæontology in the College of Charleston, and who first encountered these rocks as long ago as 1837, when carbonates were alone thought worth the seeking, enters into his subject *con amore*, for personal as well as professional reasons. He gives several colored plates of the strata of the Southern Atlantic coast and of the Charleston basin, and he endeavors to establish the derivation of the phosphates from the underlying marl by the agency of the fossil remains in which the basin so wonderfully abounds. In narrating the circumstances which led, only three years ago, to a realization of the mineral wealth which lay beneath the superficial soil, Prof. Holmes shows that, but for the interruption of communication with England on account of the rebellion, the discovery might have been made in 1864. Dr. Ansted's book on the "Geology of the Cambridge Beds of Phosphates," discovered at about that time, was procured by the author in August, 1867, and as it confirmed him in an opinion he had expressed in 1849, "that Charleston was located geologically on the same formation as that of the great city of London," he was encouraged to associate himself with the enterprise of developing the neglected resources of his native State. The connection between abstract science and human progress is seldom more striking than in this relation of Dr. Ansted's analysis of an English rock to the business of digging and treating for fertilizers the phosphate rocks of South Carolina—a business which has created a new commercial staple, and has already attracted six millions of Northern capital; and which, in the case of the beds of navigable rivers, was, as our readers may remember, lately made the monopoly of a company not too careful to give a *quid pro quo* to the State. Prof. Holmes enumerates a dozen other considerable companies that operate upon land.

—The Minnesota Historical Society has just published the first part of the third volume of its Collections. It contains several memoirs of distinguished citizens of the State and of friendly Indians, some historical reminiscences, a translation of Pénicault's "Relation," and other papers of local interest. What is of most value, and will command the attention of librarians and students of history, is Mr. J. F. Williams's very full "Bibliography of Minnesota," which occupies not less than sixty pages. It is, as the compiler remarks, a matter of surprise that so much has been printed relating to a State organized as a separate commonwealth only twenty-one years ago. Mr. Williams, who is the Society's librarian, has arranged his titles by subjects, and chronologically, with cross-references and an alphabetical index of authors. Three pages are devoted to works concerning the Indian tribes of Minnesota, and six to the Dakota bibliography (works written for the mission, educational and religious). A history of this mission is given by Rev. Stephen R. Riggs, who has himself been a great part of it, and is the author of many of the works comprehended under the heads just alluded to. The Rev. S. W. Pond, who seems to belong to the church militant—not only on account of the singular record he has kept, but because he relates that when a certain Dakota had been killed by the Chippewas, he "urged" the tribe of the former "to try to kill" the murdering party, who were concealed in a grove easily surrounded—enumerates the number of those slain on both sides in the warfare between the Dakotas of the Mississippi and Minnesota in the course of the ten years 1835–1844. The number is not great, and Mr. Pond explains why it is not, the principal reasons being that the Indians do not fight when they can help it on even terms, and that the taking of a single scalp makes a hostile expedition a success. In considering the influence on this tribal warfare of the presence of United States forces in the territory, he concludes that the loss of life "was not much, if any, less, most of the time after Fort Snelling was built than it was before." This was especially due to the fact that the Indians "were compelled to restore all captives taken in war, and they preferred scalps around which they could dance to captives whom they could not retain."

—President Barnard's recently printed "Analysis of some Statistics of Collegiate Education," written a year ago, and read last January to the trustees of Columbia College, is deservedly exciting attention, and ought to be more widely distributed than was intended. The enquiry was undertaken with a view to ascertain, if possible, the reasons for Columbia's backwardness in growing, and what might be hoped for it if, like Harvard, it threw off the classical strait-jacket, and adopted a more liberal course of studies. The immediate conclusion reached—that New York City has too many colleges for its needs, and that Columbia is likely to gain in numbers only by removing the college into the country—is of least consequence to the general reader of Dr. Barnard's pamphlet. What he shows by the way has interest for the intelligent population of every State. His remarks upon the irrational and disastrous multiplication of colleges are eminently truthful, and it is a pity they could not be laid before all those well-meaning citizens—there are scores of them, at this moment, we are confident—who have planned in their wills to establish a new academy or high-school or college, without suspecting that they are about to inflict a positive injury upon the higher education they wish to foster. The result of this imprudence in the past has been, in the language of Dr. Barnard, "either that the country voluntarily bears a burthen, in support of collegiate education, three or four times as heavy as it need be," since a college adequately equipped can as cheaply educate several hundred students as the eighty now educated on the average; "or that, of the institutions which bear the title and legally exercise the privileges of colleges, a very large number are not well provided with the instrumentalities indispensable to the efficiency of educational agencies of the highest grade."

—In New England (excepting Maine), in New York, and New Jersey, there are twenty colleges, not counting Columbia, whose catalogues have been examined by President Barnard, with results to be mentioned. Not less than six of these, we observe, are distinctly denominational, while as many more owe a large part of their support to sectarian considerations. Nearly all draw students from this city and vicinity—Yale most, and more than twice as many as Harvard, which stands next, but not twice as many as it drew in 1830, when the population of New York was only a third of what it is now. This fact is one of several which induce Dr. Barnard to assert "that everywhere throughout the country, that system of general mental culture which is to so large an extent dependent on the careful study of classical literature, and which has been so long believed to be indispensable to finished scholarship, is losing ground from year to year in the favor of the people; and, consequently, that the number of students liberally educated among us, in city and country alike, when compared with the total population, is steadily diminishing." For instance, in the States under consideration, the ratio in 1840 was 1 to 1,602; in 1860, 1 to 1,699; in 1868, 1 to 1,901; in 1869, 1 to 1,841—the war having something to do with the decline between 1860 and 1868–9. Or, regarding the college age, in 1840, one person out of 67 who were suitable received a college education; in 1860, one out of 71; in 1868, one out of 79; and in 1869, one out of 77. But, again, discarding all those students not belonging to New England, New York, or New Jersey, only one in 93 of the proper age is now educated in their colleges, or one in 2,200 of the inhabitants. If, further, "we exclude from this comparison the three New England States, Vermont, New Hampshire, and Maine, which furnish a considerable number of students to the colleges of Massachusetts, Rhode Island, Connecticut, and New York, while themselves scarcely drawing any from these latter States, we shall obtain a result still more striking": in the old and populous States remaining after this exclusion, "only one student is sent to college for every 2,567 inhabitants, and only one young man in 107 is liberally educated." Finally, in the twenty colleges, the students from abroad are to those from the same State as 1,684 to 1,718; and in six, the former greatly outnumber the latter. One of these is Yale, of whose 518 students Connecticut furnishes but 146—one to about 4,000 inhabitants. In 1824–5, it furnished 178, or more than half, and one in 1,600; in 1836–7, 194, a little less than half, but in the same ratio of population; in 1865, this contingent fell to 114.

—Taking "liberal education" in the narrow sense in which Dr. Barnard employs it, there can be no doubt that, *prima facie*, he has made out a case, and that the colleges are losing ground when brought in comparison with the increase of population. This increase, however, is mainly due to the immigration of foreigners, whose language or condition, or both, prevent them from sending their quota of recruits to our higher institutions of learning. Connecticut's growth since 1836–7 has been, as everybody knows, of this description, and before we yield to the apparent force of the argument derived from her neglect of Yale, there are other statistics which we might exact. For instance, in the past thirty-five years, what change has taken place in the relative proportion of native and foreign-born citizens of that State? What part of the emigration from it to the West has been from among the classes that support our colleges? and what is the total number of students belonging to Connecticut now attending colleges, whether in the State or out of it, as compared with that in 1836–7? Ten years hence these queries might be answered without our being obliged to make so much account of the war as now. Among the minor causes, the higher education given to girls has, perhaps, in mixed families with limited incomes, determined against collegiate education for the boys; and it will not, we suppose, be doubted, that knowledge is more generally diffused now than thirty years ago, and that the sources of information have so multiplied, and the means of instruction so improved, as to lessen the value of college teaching in the eyes of the public. Along with all this, the learned professions have been steadily losing in prestige; and since they used to be the chief end of studying Greek and Latin, their decline has naturally involved that of classical instruction.

—The decline of the ministry has been illustrated in a discourse at Amherst by the Rev. Mr. Cushing. He selected the eight New England colleges which were founded by Congregationalists, chiefly with the view of turning out ministers, and reviewed their alumni for the fifty years, 1815–65. In that time he found they had furnished 16,240 graduates, of whom 4,109, or about twenty-five per cent., became ministers. But, dividing the half-century into decades, the proportion of ministers ran thus: Thirty, thirty-five, twenty-seven, twenty, and eighteen per cent.; and the actual numbers, 688, 988, 946, 730, 757. In the last decade, the total number of graduates is nearly double that of the first, while the number of ministers is but slightly increased. Amherst has been most productive of ministers—forty-six per cent.; Middlebury, forty-two per cent.; Williams, thirty-three; Yale, Dartmouth, and the University of Vermont, twenty-four each; Bowdoin, twenty-one; and Harvard, eleven.

—"Orthodox Phrenology" is the suggestive title of a recent English publication, which would seem to commend itself to Mr. Beecher; and this, too, is not opposed to his ways of thinking: "The Intelligence and Perfectibility of Animals, from a Philosophic Point of View, with a Few Letters on Man," by Charles Georges Leroy. Dr. C. D. Ginsburg has published "The Moabite Stone," a fac-simile, with a translation. Mr. J. M. Camp writes a "Baptist History, from the Foundation of the Christian Church to the Present Time;" and the Rev. Thomas Vasey furnishes an Introduction to a "Life of John Wesley," for children. "A History of Animal Plagues," by G. Fleming, who has written about horse-shoes and horse-shoeing, we take to be a practical sort of work, of value to stock-raisers. Naturalists will be interested in Mr. H. C. Watson's "Compendium of the Cybele Britannica, or British Plants in their Geographical Relations;" and artists in Mr. William Walker's "Lessons in Animals and Figures as applied to Landscape Painting." When our postal cards come into vogue (and an enterprising Yankee publisher has printed some for use, of course without any authorized reduction of postage), we may be glad to avail ourselves of the late Admiral Sir Francis Beaufort's "Cryptography: A System of Secret Writing adapted for Telegrams and the New Halfpenny Postage Cards," which is itself published on a card, and sells for sixpence.

—"*The Phœnix*, a monthly magazine for China, Japan, and Eastern Asia," is the title of a new literary venture in London, under the conduct of Professor James Summers, of King's College. The necessarily restricted circle of readers to which a magazine of this class is addressed prevents the indulgence of very sanguine hopes that it will prove a commercial success to its projectors. In a literary point of view, it is neither better nor worse than the numerous predecessors of a similar nature which are to be found on the book-shelves of most Orientalists. Some inscrutable law, moreover, appears to operate against the continuance of an "Asiatic" magazine after the hand which launched it has ceased to labor for its pages. The *Chinese Repository, Chinese and Japanese Repository, Notes and Queries on China and Japan, Straits Magazine* (the first-named successfully edited for a period of twenty years by our erudite countryman, Dr. S. Wells Williams, now U. S. Secretary of Legation at Peking), and a host of others, have lived and died within our own memory, until we have come to the conclusion that the law referred to is absolute. We mean, however, no disparagement to the pages of the *Phœnix* in our remark as to its comparative value. Publications of this nature have usually received the hearty support of leading Orientalists, as being the only means of making public the results of their special labors, and the number before us contains several papers of interest. Mr. Hyde Clarke, foreign secretary of the English Ethnological Society, contributes a good article upon the ancient Scythians. A review of General Alexander's dramatic adaptation of an old Chinese romance, is perhaps the most noteworthy paper of the current number, which also contains an article on the Tientsing massacre—which is, of course, inevitable in any publication supposed to bear, however remotely, on Chinese topics. A translation from the Chinese entitled "The Pearl-embroidered Garment" is amusing, and a "Note on the Manchu Language" by the editor shows considerable labor.

THE MAGAZINES FOR DECEMBER.

It is imagined that in the magazine world as well as in the vegetable it is always evident when the year declines towards its end. The preparation of the January magazine, the number extraordinary, which is to appear in the December holidays, at the time of the making of presents, is held to be very exhausting to editor and publisher, and the December issues—or rather those of mid-November—are usually held to be, in consequence, far feebler than common. This, however, we take to be a mistaken view, and arises, we imagine, from popular comparison of the magazine in possession with the prospective magazine with its heralded list of famous names—names which, as a matter of fact, very commonly cover magazine matter which is no better than the general run of periodical literature, and often is not so good. It may be the proverbial blindness of authors to the relative merits of their various works; or it may be their easy good nature, worked upon by the clamors and supplications of publishers; or it may be for some reason so discreditable as carelessness of their own reputation and of the interests of literature, provided only money may be had; but, for whatever reason, it is certainly true that both here and in England men of eminence can be got to sell to the publishers, more especially at the time of the New Year Magazines and Annuals, and to accept excessive pay for them, productions which often seem the mere sweepings and leavings of their portfolios and study-tables. Oftener, perhaps, they sell productions not quite so bad as that, but still far below the level at which it becomes men of eminence to remain, and, too, far below the level at which it is profitable for the rest of us that they should remain. It is, of course, their names that they sell; or, at all events, their names is what the publishers buy, and the quality of the goods purchased very frequently appears to show that the seller knew very well the nature of the transaction. Thus it is that it happens, as we think we have observed, that despite the great noise which ushers in the first magazines of the year, these are not in the average better than the other numbers, and thus it happens that the December numbers are popularly pronounced weak. It is not that the preparations for January induce mental and spiritual exhaustion in the editor; primarily, the evil has its root in ourselves, that we are such persons as greedily to buy cheap stuff if it have a dear brand on it; and, secondarily, in the publisher, who takes advantage of this weakness of ours, and in the poets and essayists and statesmen and divines, and celebrated persons generally, who are not above pocketing money in a transaction which they can hardly hold in high estimation.

The December magazines are on the whole readable, though there is in them hardly any work of the first class—if we except Mr. Howells's essay and Mrs. Stowe's story in the *Atlantic*.

The former, if only for the rarity of its kind, may be said to be a work of the first class. It is marked by all Mr. Howells's subtlety and delicacy of humor and fancy, and it is careful and finished in point of expression, as is sure to be the case with the work of this writer, who is not a writer to whose example any author will ever refer when the question comes before him of selling his name with some crude or trivial writing attached.

A humorist of a decidedly different sort, as respects either subtlety or delicacy or finish, is Mr. Ralph Keeler, who writes "The Confessions of a Patent Medicine Man"—a promising subject, but here treated in an unskilful way. The mixture of narrator and the subject sketched is unpleasantly obvious; and the subjective humor of the writer adds nothing to the effect produced by such glimpses as we get of the really grotesque creature whose portrait he had an opportunity of painting. Some of the stories told are amusing, and probably there is little or nothing false in them. Very unsuccessful, too, is Mr. Barnet Phillips's clumsily elaborate and elaborately clumsy "Rudolph"—an essay which appears to be an attempted satire on the system of education which crams the heads of children with more knowledge than is good for them. Such a sketch, if not based on fact, is nothing; and, if based on fact, it would require affidavits for its support, and only then could it be anything more than a disagreeable literary failure.

Other humorous pieces in the *Atlantic*—which, as it happens, is largely made up of articles falling under this general description—are Mr. W. J. Stillman's "John Bull at Feed," and the "Oldtown Fireside Story," by Mrs. Stowe. Mr. Stillman's essay is not particularly new, but it is pleasant reading of its well-known kind; and whatever may be thought of some of its assertions by the admirers of French cooking and the Franco-American cooking of this city—where, Philadelphians and San Franciscans to the contrary notwithstanding, it is alone in America possible for men really to dine—every instructed person will admit that its main doctrines are worthy of all acceptation, and that it would be well if they could be urgently preached in all our borders. Competent observers testify of the American woman in her highest state of development, that her most cherished notion of dinner is to have some flowers on the table, and an elegant dinner service. Some form of pork, hot bread, strong coffee, no flowers on the table, and something sweet and indigestible, is the notion of a dinner entertained by vast numbers of both the women and the men of that portion of the American population which is less developed; while in many parts of the country there is an uneasy feeling, perhaps derived from our Puritan ancestors, that there is something disgraceful in eating at all, and dinner is looked upon as a necessary but regrettable recognition of the domination of Satan over man, while man is yet confined in the corrupt house of this body. For one reason or another, although American water, earth, and air teem with materials for the very poetry of food, and dinner might here be glorified, there are nowhere in the world forty millions of souls who feed so wastefully and dine so little as the people of the United States. Moral causes are doubtless at the bottom of it. There is surely no geographical reason for this peculiarity of ours. Across the imaginary line that separates us from our Provincial friends, there is dining —dining as solid, substantial, leisurely, earnest, dignified, and productive of robust men and women, as in London itself. Perhaps, even as German immigration is teaching us how to drink, the Canadians, when General Butler and Mr. Chandler have "enticed" them over—as the mate said when he hit the sailor with the handspike—may teach us Christian habits of eating.

Mrs. Stowe's sketch is admirable, and adds one more to the proofs that her best purely literary reputation she has earned in the field of close sympathetic observation and successful reproduction of distinctively New England life. In literary history her place is very secure; for one thing, never was a book more opportune than "Uncle Tom's Cabin," and whether or not it will long be much read or much admired, it will never cease to be spoken of as long as American slavery is remembered. And as long as Byron's story is talked about, Mrs. Stowe has a second security against oblivion settling on her name. But when the enlightened New Zealander comes and seats himself on London Bridge, to survey the ruins of Saint Paul's, if he has the means of making a comparative estimate of Mrs. Stowe's various works, we are mistaken if he does not hold that her best title to admiration is not the opportune Uncle Tom, despite Aunt Ophelia and Topsy, nor the pieces of poetry, nor the prophetic swamp negro, nor the argumentation in the Byron case, but the singularly successful picture, instinct with genuine life, of the shiftless, handy, good-natured, lazy Sam Lawson, who deserves a place beside Mr. Birdofredum Sawin, though with his opinion as to "religious privileges" he might be uneasy at the proximity. It is the will rather than the moral sentiment that has fallen into decay in the genus of New Englanders of which Sam Lawson is the type, and he will doubtless die on the Plymouth Platform with his "mind clear" as any deacon's on points of doctrine, and a prayer at his funeral as comforting to his relict as she could desire.

For the rest the *Atlantic* has the conclusion of Mr. Henry James's story called "Travelling Companions." It is clever and interesting, and Mr. James's usual inscrutable young woman suggests agreeably the better sort of American young ladies. We do not find, however, that the direct effort at putting her before us succeeds in doing so. The love-making dialogue, in particular, is highly extraordinary, and Miss Evans would be justified, we should say, in breaking her engagement on her arrival among her friends in New Jersey, though her self-dissecting, criticising, mystery-making lover may very likely, as is the natural fashion of such, have shown himself even troublesomely fond when once accepted. "Father Blumhardt's Prayerful Hotel" is a fairly good description of a curious community of enthusiasts, not unlike our Spiritualists as regards the reasonableness of their faith. "A Virginian in New England" is interesting, though certainly not exciting; it gives one a very favorable impression of the diarist, and gives us, we confess, a little chill by the picture it presents of the Massachusetts life of thirty-five years since. "Indian Summer" is to be commended for its truth of detail, for its good feeling, and its accuracy of observation, and will, by reason of these good qualities, give pleasure. In our own case, the pleasure was a little marred by the lack of *vraisemblance* in the incident upon which the story hinges. The poetry of the number is by Mr. Whittier and Miss Larcom, and the book-notices are numerous and good, except that of Mr. Arthur Helps's last publication, which yet has a good deal of truth in it.

Scribner's Monthly has a prosperous look, and bids fair, we should think, to become the favorite magazine of great numbers of people. That being the case, it is much to be wished that it should be kept free from such things as the poetry of the "Honest Fairy Story." It is, of course, not so bad as the verses which opened the last number—they constituted a glaring offence against good manners, and even against common decency. But there is an inherent vulgarity in such things as these verses, with their accompanying illustrations, which also is demoralizing in its way, and a thing to be regretted. The piece entitled "Love's Young Dream" is less objectionable, but it will do no one any good.

The first article of *Scribner's* is an illustrated paper on "The Street Venders of New York," and will be of interest both inside and outside of this city, as it gives some account of odd occupations pursued by a strange class of persons, who are striking figures in the panorama of New York street-life, and of whom more by far is seen than is known—persons such as the balloon-seller, the chestnut vender, the armless man in Park Row, who whittles with a knife held between his toes, the tooth-powder man, and the *Siempro vive* seller. The second paper is a compilation (illustrated) of narratives of remarkable escapes effected by jail-birds or other prisoners, and is of a kind to be popular. So, we suppose, is Mrs. Harding Davis's "Natasqua;" it is like all her other work, and that, if not so well liked as at first, still finds numerous readers. Other articles in this number of the magazine are a good moralizing of an old monkish legend, by H. H.; a "Thanksgiving Love Story," of a good-natured sort, by Mr. E. Eggleston; an instalment of George Macdonald's serial novel; a readable enough description of Berlin; a rather noisy essay by Mr. Samuel Hopkins, who knocks the Pope about fearfully, and has a bang or two for Francis Joseph, and Napoleon, and Isabella; a description (illustrated) of the Hoosac Tunnel; and some other matter, including Mr. Welford's *Bookbuyer* letter from London.

About the most noticeable thing in *Old and New* nowadays is the way in which the editor continues to make, from month to month, his one or two jokes upon the words "old" and "new." It begins to be something like watching a man on a dangerous tight-rope, whose effort may every time be successful, or may at any time be fatal failure, and who gives the spectator rather more pain by his danger and his profitless dexterity than his skill can give pleasure. The other contributors and contributions to the December *Old and New* are Dr. Bellows ("Natural and Revealed Religion"); Dr. J. F. Clarke ("Wanted, a Statesman"); a translation of a rather feeble essay ("The Four Gospels") by Sainte-Beuve; "The Improvisatore and the Heeler," by Mr. F. W. Loring, a young writer of promise, who, however, seems to be as yet in bondage to Dickens, and who might very profitably study methods more realistic; "Jefferson's Rip Van Winkle," which is too eulogistic in tone; and more of "Pink and White Tyranny," which may be much enjoyed by homely young ladies as doing full justice to that silliness passing the silliness of woman which female novelists sometimes discover in young ladies whom dazzled and stupid man thinks pretty. "The Dying Gladiator" is an essay worth reading, written by Mr. Theodore Lyman, who sums up the arguments and theories as to the nationality and character of the man represented by the celebrated figure, and, after deciding it to be a Gaul, goes into some ethnological speculations which at least are not wanting in dash. "Athens and her Enemies" is some spirited verse by Mr. William Everett; and this, with some pretty stanzas by Mrs. A. D. T. Whitney, and some more by "H. H.," who can, when she likes, be sibyllic enough to be extremely puzzling to the average mind, make up the poetry of the number. "Ah Ying" we must mention as some readable talk, by a man who appears to know his subject, about the Chinese merchants of San Francisco. Honorable and able men he asserts them to be, and of rather better mercantile standing in California than an equal number of traders of any other nationality.

Lippincott's for December is as good a number of this magazine as we have ever seen. The first article tells a strange story about a certain Southern gentleman who occupied the curious position of being known by influential Southerners and influential Northerners to be in the service of the rebels as a messenger, if not a spy, at the same time that he was the Southern correspondent of a loyal Northern newspaper. He went South and North as pleased him, always provided with necessary credentials, and while, as we have said, known in his double capacity to some officials and officers on both sides, to most he was known as the devoted adherent of the side to which they themselves belonged. We do not know how well worthy of credence the story may be, although from the manner of relation we are disposed to accord it full belief. It is tantalizingly told, with suppression of real names—a necessary precaution, perhaps, though one would think that, except in a few cases, the writer might have disregarded it. It would, for instance, be counted for glory, we fear, rather than for shame, to the Northern editor who hired our rebel friend as correspondent.

Another readable article is the lively description of the new Florida—the winter resort of invalids. The soil, climate, flowers, birds, beasts, reptiles, and insects, the writer takes up in turn, and as he has well seen what he is writing about, and is in apparently high spirits, and is well contented with himself, and is not afraid of a bad joke—though he certainly very well might be—he has succeeded in making a bright, entertaining, cheerful article, which we suppose may be useful to such invalids as do not intend going to Florida as well as those who do. Here, for instance, are some comically well-selected adjectives: "A cage full of paroquets is a comical sight; they are perpetually quarrelling—cursing and swearing at a great rate." And here is something about the mocking-bird which everybody may believe who likes:

> "The bird is, however, considered rather a dissipated character, and sets a bad example to the young people. I have always thought that a young man who can sing well is in great danger of falling into bad company, and is likely to acquire wild habits; and this bird is a case in point. He forages about, singing in his neighbor's vineyard while he robs him, until the berries of the Pride-of-China tree are ripe, and then he proceeds to have a regular frolic, acquires a habit of intoxication, and gets as drunk as a lord. It is curious to see a flock of these birds at this time. They become perfectly tipsy, and fly round in the most comical manner, hiccoughing and staggering just like men, mixing up all sorts of songs, and interrupting each other in the most impudent manner, without any regard to the politeness and decorum that usually mark the intercourse of all well-bred society, whether of birds or men. They will fly about promiscuously, intrude on domestic relations, forget the way home. and get into each other's nests and families, just like the lords of creation. After the berries are all gone and the yearly frolic is over, they look very penitent, make many good resolutions, join the temperance society, and never indulge again until the next season comes round and the berries are ripe once more.
>
> "I do not think that naturalists have noticed this peculiarity, and I have the honor of calling their attention to my interesting contribution to natural history. I believe that this habit is peculiar to birds that sing, just as wine and song go together among men. It is only another proof that wine is a mocker."

Solider articles are that by Mr. E. A. Pollard—who takes an encouraging view of the condition and prospects of the South, and who writes in a better and more mature style than is usual with him—and that by Mr. Amasa Walker, entitled "Expansion and Contraction." Mr. Walker is of opinion that the action of Congress, in relation to the currency, has been such that resumption of specie payment by the Government and the banks "must be regarded as indefinitely postponed;" and he adds that, on account of this action, the United States would seem to be willing that they should be rated financially with Austria and Russia, the condition of whose currency "has been their disgrace for half a century." He adds further, however, that "while saying this we do not admit for a moment that the people of this country acquiesce in such a decision of this great question." He apparently expects something from the next Congress, or more probably, perhaps, from the Congress that shall come together after the next Presidential election.

Among the other contents of *Lippincott's* is a touching little unmitigated love story, by Mrs. Harriet Prescott Spofford—having in it some small quantity of "chrysophrase" and the like, but, on the whole, written really well, and containing some of the least objectionable of "word-painting" and of that "intensity" of feeling which is to true strength of feeling what hysterics are to high athletic training. "Louis" is the title of the story, and it may, we think, be enjoyed by people whom much of its clever author's previous work has affected unpleasantly. "The Appian Way" is a characteristically smooth, and correct, and verbose set of stanzas, by Mr. T. B. Read. "Cacoethes Scribendi" is another love-story with a certain perfectly common and perfectly likable rawness and artlessness which it will doubtless please good-natured people to read. "Our Monthly Gossip" has some talk about Gottschalk which will interest musical readers; a pro-French discussion of the German policy of annexation; some reminiscences of the once famous Nicholas Biddle, who, it appears, had a knack of making impromptu verses; an apparently honest description of the condition induced by hashish, and a eulogy, by "Ouida," on Colonel Pemberton, an English officer killed at Sedan, who, according to most accounts of him, deserved better of his fellow-creatures in Philadelphia and elsewhere than to be written down as "my friend, the author of 'The Scapegoat,'" by one of the most shameless and corrupting of contemporary female writers.

The *Galaxy*, in taking leave of the old year, promises for the new year a number of articles on Americanisms of speech (Mr. Grant White), which cannot fail to have value; a series of sketches of life and adventure by "Porte Crayon" (Col. D. H. Strother), whose pen and pencil are favorably known to old readers of *Harper's Weekly*; a novel by Mrs. Edwards; more of the "Memoranda" of "Mark Twain," and more of the contributions to American history, made by men who have helped to make our recent history, which have helped to fill the columns of its last volume. Of these contributions, some of the pleasantest have been those made by Mr. Thurlow Weed, who in this December instalment of his reminiscences is especially agreeable and readable. Without doubt, his "Autobiography of Mr. Thurlow Weed" will do much, in virtue of its frankness and straightforwardness and modesty, to keep his memory sweet; it can hardly fail to persuade into a good opinion of him many persons who have hitherto thought of him as of a mere manipulator of New York politicians. The *Galaxy* has, besides, an interesting narrative of a visit to the domain of a Prussian nobleman living in feudal state in Silesia; a clever lady's description of Wilhelmshöhe; an essay entitled "Shakespeare as a Plagiarist," by Mrs. Abby Richardson, who writes with intelligence; some chapters of Colonel De Forest's "Overland," and of Mr. Justin McCarthy's "Lady Judith;" two clever, sensible, and witty essays by "Philip Quilibet," who writes of the Franco German war; some amusing extravagances by "Mark Twain," who amuses himself by laughing at one of the very British critics who disapproves of the American tourist as he appears in "The Innocents Abroad;" and a forcible plea for international copyright, by Mr. Charles Astor Bristed, who shows us how, and with what effect, we steal books from foreign authors. There are also in the *Galaxy* the usual number of book-notices and brief essays under the head of "Nebulæ;" and altogether the magazine well sustains its reputation as being our best magazine for light reading of current interest.

The *Overland Monthly* for December has, for its most noticeable article, another of Mr. Bret Harte's poems—"His Answer to 'Her Letter'"—which will hardly be as popular as most of its predecessors, though it has their characteristic marks of local Californian color, humorous perception of character and sentimentality. It might, by the way, be worth while to know how it has happened that the cockney use of the relative pronoun "which" obtains in California. Perhaps in that *congeries gentium* are to be found the idioms, vulgar and otherwise, of all lands; but we should imagine that most Eastern readers not saturated with Mrs. Gamp would find lines such as these that follow striking strangely on his ear:

"Being asked by an intimate party—
Which the same I would term as a friend—
Which his health it were vain to call hearty,
Since the mind to deceit it might lend."

Of really good articles in the *Overland* for this month, one of the best is a careful one by Mr. Charles W. Stoddard, who is known to some of our readers as a skilful verse-maker and a poet worth some attention. "A Canoe Cruise in the Coral Sea" is the title of it. Good, too, is the historical sketch of Mr. Robert J. Walker's Administration in Kansas, and that of the Red River Country and its people.

The attention of all careful readers of Mr. Froude's "History of England" should be given to the current number of the *Catholic World*, in which there is an essay, learned, vigorous, more candid in tone than is usual in the case of semi-polemical controversy, and seemingly conclusive, which attacks Mr. Froude for something worse than what at the best is gross carelessness. The article has been preceded by others equally worthy of study, and is to be followed by still others which may very probably be of still further discouragement to the pictorial and partisan school of history-makers. Most of the other matter in the *Catholic World* will be equally edifying to the Romanists and to the Protestant reader, it being of the Catholico-argumentative order as regards logical method, and the subject-matter being such as is generally left to religious disputants.

In *Harper's* we have Mr. Curtis in a graceful, kind, and sensible essay, written apropos of the so sadly timely and untimely death of the late Fitz Hugh Ludlow; also, on "The Perils of Political Life;" Mr. M. D. Conway, in the last of his curiously learned papers, entitled "The Sacred Flora;" half-a-dozen illustrated articles of the kind known to all the world, and very full "Literary," "Scientific," and "Historical Records," followed by the stories of the "Editor's Drawer"—making altogether the typical American magazine, and one of which we need not be ashamed; although its existence as it is need not prevent us from indulging, in respect of magazines also, our American belief in an indefinitely better future in store for us.

HOLIDAY BOOKS FOR THE YOUNG.—III.*

THE animals talked about in "Curious Facts for Little People" are the mole, badger, otter, deer, dog, sheep, horse, birds, dolphin, and whale, with a capital illustration for each. The stories are fresh and attractive, and told in simple language as well as printed in bold type; and the book is altogether a handsome and appropriate gift for a little child.

"John Whopper" began his mendacity, we believe, in *Old and New*, and though in the magazine the story was apparently designed for adult readers, it can hardly be classed by itself unless among juvenile publications. As the intellectual product of a grown man, or as the amusement of men and women, the performance is slight enough; but school-boys and girls may possibly enjoy the fancy of a newsboy's trips through the earth's centre to the antipodes of Boston—to Canton in China—his passage through the earth's axis to the North Pole, and subsequent voyage home on an iceberg. A certain local flavor is given to these adventures which will make them rather more interesting to read in the circle of which the Boston *Transcript* forms the centre than elsewhere. But the fiction is too purposeless to find enduring favor, we apprehend, even in those limits among the young.

As to Mrs. Samuels's success as a writer for children, there will hardly be two opinions among the little folks themselves. The six books which form her "Springdale Stories" will be found interesting by all children, from the youngest who can read at all up to boys and girls of twelve or fourteen years; and two or three of the volumes—"Adele," for instance, and "Netta's Trial," and "Johnstone's Farm"—might be read aloud by parents to still younger ones, and found entertaining by both readers and listeners. And that, we suppose, is as much as saying that the books have plenty of incident, very little moralizing, no mock sentiment, and are written in what the author calls "readable English," which is not over the heads of the audience. The children, too, whose adventures are related, though we are not going to praise them for their naturalness, are yet quite sufficiently like real boys and girls to make a personal interest in them quite possible. Whether, however, the account of all the "hair-breadth 'scapes" that Mrs. Samuels puts her little heroes and heroines through—one of them, a boy of twelve or thirteen, goes down in a diving-bell, saves a baby from a burning house when all the adult firemen are afraid to venture, sets a prairie on fire and narrowly escapes being scalped by Comanches; and the others have adventures nearly as thrilling—whether, we say, so much exciting reading will not make anything short of a sensational novel pall hereafter on the children's tastes, is a question which parents might do well to take into consideration. The books are certainly more interesting than children's books are apt to be, and that they are so is due to the easy simplicity of the narrative and the rapid succession of striking incidents. That they are not over-probable incidents nor particularly natural characters to whom they occur, are defects which will be likely to trouble adult readers more than the little ones—and we suppose, too, that it is not at all to the detriment of the latter that the good children in these stories are once in awhile almost too good for this world, and the naughty ones—even when, like Warden Nelson, they are capable of beating smaller boys and even attempting to smother them—are reclaimed and made over into plucky saints with almost too great a facility. Optimism, even when it is a little exaggerated, is certainly the philosophy of life for children.

There is nothing to be urged against the "Fairy-Folk Series" on the score of its exciting character; and children being, whether fortunately or not we do not pretend to decide, so willing to read or listen to anything in the shape of a story, they may not impossibly give pleasure to such of them as have nothing better to measure them by. They are tolerably dull, however, and show on the part of their authors a commonplace effort to be imaginative, and a desire to be perfectly decorous, and a willingness to adapt themselves to the supposed capacity of their readers, which is a rather melancholy indication that writing children's books is not the precise work for which nature intended them.

"On the Seas" is an English book, the scene of which is, however, laid in the first place in "New York, the greatest merchant city in the United States of America," where the father of its hero, Captain Griffin, has a "handsome house in the Broadway." It is not a bad story of adventure in the Arctic seas, written with a certain old-fashioned simplicity of manner, and boys of twelve and upwards might find it interesting reading.

Very much better than it, however, and for readers about the same age, is Mr. Locker's story of life in the Australian gold diggings. Mr. Locker seems to understand his audience better, and to respect both them and himself more than is often the case with people who write for boys. His incidents are exciting without being unhealthily so; and, with every temptation and facility for heightening his effects by means of the horrible, he never tells a cruel story, keeps himself well within the bounds of probability, and writes with a pleasant straightforwardness which will do his readers good. It is a book which may safely be put into the hands of boys, which is true of very few of the books written expressly for them.

We being judge, as much could by no means be said of Mrs. Wood's "Orville College Boys." As a picture of school-boy life it seems to us to be worse than worthless; and the only moral it would be likely to suggest to readers of any age is, that a little less Christian forbearance, and a little more manly assertion of his authority and his claims to respect on the part of the martyr of the story, the persecuted German master, would have been much better for all parties concerned. This is the book, too, which Mr. Hope, the amusing author of the "Book about Boys," criticised as having been written in a "peculiar dialect, based upon English"—a criticism which any page taken at random more than justifies.

We cannot number the years since our first reading of William Howitt's "Jack of the Mill," but it was long ago, and we are glad to see the story revived, finding our pleasant recollections of it confirmed on reperusal. It is not beyond criticism, as an artistic narration, but that will not injure it in the opinion of its proper readers. It is written, as it clearly shows, pretty much as it was told by the fireside, being, as the preface describes it, a "hatch-up"—that is, a tale invented as the author went along, and therefore unnecessarily (though we think agreeably) spun out with descriptions of nature and other makeshifts for the exercised imagination. This is especially true of the first part, which only after repeated tellings, perhaps, was linked with a more serious design than pure entertainment. As it is, it is a semi-historical novel, relating to the persecutions of the Lollards and the wars of the Hussites, under Ziska, and inculcating religious freedom also by examples of Jewish fidelity and humanity. The portraiture of Old England in those days, both in its scenery and in its social and political condition, is calculated to leave truthful and lasting impressions, while the romantic adventures of the hero are, if our own experience is a test, sure to be vividly remembered beyond the age of childhood.

The Nation.

NEW YORK, THURSDAY, DECEMBER 15, 1870.

The Week.

THERE is talk of a movement in Washington for the suppression of Mr. Schurz, begun, we are sorry to say, by the President, who refused to receive him when he called at the White House on his arrival at Washington, and now continued in the Senate by the devoted adherents of the Administration and the blinder party men. The first step against him in the Senate has been the refusal to put him on the Committee on Retrenchment in place of Mr. Patterson, and further rigors are said to be in store for him. There is no doubt that they are poor friends of the President, and still poorer of the party, who try to push this Missouri quarrel any further. There is, unfortunately, only one person who has any good reason to look back on that conflict with much regret, and that is certainly not Mr. Schurz. The public, too, which does not know much about the details of it, is strongly of Daniel Webster's opinion, when he wrote in 1841, being then Secretary of State, that "it was a great abuse to bring the patronage of the Government into conflict with freedom of elections."

The first step towards the realization of the President's St. Domingo scheme was taken by an attempt to substitute Mr. Conkling on the Senate Committee on Foreign Affairs for Mr. Patterson, and thus outnumber Mr. Sumner, who is said to have his pouch full of cartridges and to be prepared to fight to the last on this business—Mr. Conkling being bound to the President by his great and memorable victory over Mr. Fenton last summer in the matter of "Tom Murphy" of the Custom-house, and of other office-seekers and holders. Mr. Patterson, however, declined to yield, and the committee remains as it was, and the treaty will not get through. Whether annexation by joint resolution will be tried, remains to be seen; if it is, we may look for a conflict in some degree recalling the days of Andrew Johnson. To "practical men," both in the House and Senate, there are features in the annexation of places like St. Domingo of which it would be difficult to overestimate the attractiveness.

Admiral Porter, while in command off Fort Fisher, wrote a very foolish and abusive letter about General Grant, with some collateral observations on General Butler, to the Navy Department, he (Porter) being one of the men with whom one meets every day on whom the pen seems to exert an intoxicating effect, and who, though sensible enough in everyday life, write like raging blatherskites. This letter has now been dug out and published—at first, it was thought, by Secretary Welles, but since proved to be by some naval "ring," for the purpose of barring Porter's succession to the vacant admiralship. The letter has, Grant has declared, "destroyed his confidence in human nature," Porter having then and since been profuse in expressions of respect and attachment; but Grant has done a good deal to maintain other people's faith in it by sending in Porter's nomination all the same. Porter, however, did his best to destroy public sympathy for himself, and pretty thoroughly succeeded, by again seizing the pen, and under its malign influence writing an abject and humiliating defence of himself, half confession and half apology. The most vindictive enemy could not have invented a better means of bringing him to shame.

It was under these circumstances that his nomination went to the Senate, before which it lies at this writing. In the House, however, the Admiral meets with none of the mercy or magnanimity shown him by the President, for there he has to face General Butler and General Banks—the one writhing under the insults of the Fort Fisher expedition, the other under the loss of the cotton collected by the Red River expedition, which Porter is said to have carried off for a marine league from the banks, to the great chagrin and disappointment of the chief of the land force. So General Logan, having brought in a bill for the abolition of the admiralship, to which Porter aspires, Butler went to work at him savagely, and denounced him fiercely. The most affecting portion of the speech was that in which he argued against Porter's elevation on the ground of the bad effect his example would have on the youth of the navy. This anxiety of the General about the models of conduct and character which the young men of our country have before them, will doubtless cause nausea even among the "moral" ostriches in Massachusetts who carried him into Congress. Even their stomachs can hardly be equal to the digestion of his desire that the eyes of minors should only rest on the truly good in high public positions.

The bill was nevertheless passed by a two-thirds vote, and with a great heat and fury, Mr. Scofield asking in vain for delay and consideration—he might have said, for decency. The blood had got into General Logan's head, and he talked much as he did last year about Sherman and the army, though, we confess, we think he is right in thinking that we have no use for an admiral, and that the man for whose honor the office was created being dead, and the navy dwindled down nearly to nothing, the office might as well be abolished. The bill will probably pass in the Senate also, and Porter will remain a vice-admiral, all owing to his having written one foolish letter too many. But there must be many an old hack in Washington who is now fawning on Grant, and who did fawn on Lincoln, who thinks with a chuckle in the stilly night, after the last office-seeker has left his bedside, of the letters he wrote abusing these two personages, in which they were set down as something very far removed from heroes and statesmen, and thanks his stars that they have not got to light thus far. The indignation with which he and his kind look on Porter's indiscretion is very amusing.

Congress met on Monday week, with a short session before it, and a large amount of back-work pressing for early attention. Among all the measures that have thus far come to the front, reconstruction and strictly party questions generally are least prominent; but in Senate and House we have bills to resume specie payments, to abolish the income tax, to revive navigation, to grant aid to railroads and steamship companies, and for like material objects. The most remarkable measure in the Senate, which, the *Tribune* correspondent says "seemed to meet with little favor," has been Mr. Wilson's bill to prevent political or other forced assessments on Government employees, the fate of which will be watched with interest. In the House, the discussion of the report revising and consolidating the Post-Office statutes has led to the abolition of the franking privilege, with some exceptions in favor of newspapers and periodicals. The St. Domingo business was brought up by Mr. Banks, on Monday last, in a resolution substantially the same as that introduced the same day by Senator Morton, but which the House declined to submit to the previous question, referring it to the Committee on Foreign Affairs, not to be reported without five days' warning. It provides for a commission to visit the island, and get at the facts of the case, both in regard to the nature of the country and the wishes of the population. Mr. Logan's move, the same day, to abolish the offices of admiral and vice-admiral caused some excited debate, to which Gen. Butler naturally contributed his full share. Dissatisfaction existed not only with Vice-Admiral Porter, but, on account of the *Oneida* disaster, with Rear-Admiral Rowan also. The bill was passed by a two-thirds vote. A resolution of Mr. Kelley's, that the true principle of revenue reform consists in abolishing the internal revenue system, was supported by 164 yeas to 6 nays. Finally, under Gen. Butler's lead, the Tenure-of-Office acts were abolished without debate.

There is a telegram from Missouri of a curious kind about the relations of Gratz Brown—whom many people begin to regard as the coming man—with "the labor reform party." He has been waited on by a delegation from it, and has said, it is reported, that he approves of its "three fundamental principles—the ballot, the issue of money by the Government for the benefit of the people, and the right of eminent domain in public lands." Most platforms are somewhat mysterious, but this is more mysterious than any we have seen for some time. We presume "the issue of money by the Government for the benefit of the people" is that old familiar doctrine of the "labor reformers" to which we have so often given in our adhesion, that every poor man should have as many greenbacks as he wants, provided nobody else is obliged to take them for goods. Unlimited greenbacks for people who are in want of money is the American equivalent of the plan so long advocated by the French socialists—by which banks were to be established by the Government to lend as much money as they needed without interest, and thus supply them with the thing called "credit," which capitalists made so much fuss about, and then monopolized themselves. Upon the same principle public offices might be opened to lend disreputable people a good character for short periods, or to supply genius in limited quantities to dull writers. If Mr. Gratz Brown has any scheme of this sort in his head, he has a great future before him.

A dispute of considerable magnitude has broken out between the Government and the Pacific Railroads. The United States has given them a large amount of bonds to be sold by them, and the money applied in aid of the construction of the roads—that is, lent them their credit; but the companies were to pay the interest on the bonds, and the bonds themselves at maturity, the Government taking a second mortgage as security. The question now arises, When is the interest to be paid? The Government maintains that it should be paid by the companies as it falls due; the companies, that it should not be paid till the principal is due; but Mr. Boutwell seeks to enforce the former view by withholding the money due to the companies for freight, etc., on Government account. The lawyers are now busily at work over the construction of the act. One opinion from Judge Hoar and Mr. Sidney Bartlett holds prettly firmly that Congress certainly did not intend the roads to begin payment of the interest at once, and cites in support of their position that the attention of Congress was called to the absence of any express provision for the immediate payment of the interest, and it refused to insert one. In the meantime, the Union Pacific is in considerable trouble owing to the persistent efforts made to depress its bonds by all sorts of evil reports—the Western Union Telegraph Company, with which it has had a quarrel, spreading them beautifully.

Business continues in a rather unsatisfactory condition. Failures are increasing in numbers and magnitude, and the strikes of the shoemakers and coal-miners are assuming serious proportions. The steady decline in prices of so many articles at one and the same time inflicts widespread losses; but the absence of speculation, and the generally prudent spirit in which the merchandise trade has been carried on for some time past, prevent any serious results. Cotton has continued to arrive in quantities far exceeding the experience of any year since 1861, the receipts at all the ports being 151,000 bales, and prices a trifle lower. The exports of cotton and all other products are likewise large, and remove for some time to come all prospect of the export of gold, which consequently remains weak and declining. Money, in the absence of all business activity, is easy, and enables the Wall Street manipulators to keep the stock market strong in appearance, but without real business. The decline in breadstuffs, meats, and coal, and more especially the miners' strikes, are diminishing the earnings of railroads, and still further discouraging speculation, while the discussions in Congress, and the action of Secretary Boutwell concerning the Pacific Railroads, have lent additional uncertainty to an important financial interest. Real estate is unsettled and inactive. The holiday trade is reported light, but the sound legitimate country and city trade in dry-goods and groceries is steady and satisfactory. Neither the Department reports nor the initial steps of Congress have affected general business in the least, and some feeble attempts to take advantage of them for purposes of speculation have proved complete failures. The war in Europe appears almost forgotten by business men, and the curtailing of Cable news scarcely excites comment.

The reports concerning the movements and continued struggles of the Army of the Loire, after the evacuation of Orléans, are presented to us in a very confused and altogether unsatisfactory state, owing, perhaps, to the sudden Cable derangement. It is hard to make out whether the great captures the Prussians are reported from Berlin to have made "at Orléans"—ten thousand prisoners, seventy-seven pieces of artillery, four gun-boats—are represented as the aggregate losses of the French army in its various engagements around that city, or as the result of its hasty flight and of a hot pursuit. The report has altogether a somewhat unauthentic look. The defeated army appears to have retreated in three divisions, the one moving in the direction of Blois and Tours, on the south bank of the Loire; one—formerly the right wing—on the north bank of that river towards Gien; and the third, probably the feeblest, between the two others, towards Bourges. This last division seems subsequently to have been consolidated with one of the two others, now forming independent "armies"—"the First" and "the Second," under Generals Bourbaki and Chauzy, respectively—General D'Aurelles de Paladines having been removed from command—a victim, if our insufficient information entitles us to judge, to popular prejudice and clamor, rather than to the exigencies of the situation.

General Chauzy, after a short retreat, made a stand near Beaugency, covering, if the reports be correct, both banks of the Loire from Meung, west of it, to St. Laurent-des-Eaux, east of it. In this position he was attacked, Wednesday, December 7, by the right wing of Prince Frederic Charles's army, under the Grand-Duke of Mecklenburg. The contest was severe and indecisive, though the Prussians captured one gun, several mitrailleuses, and a number of prisoners. General Chauzy, too, made some captives, and the Second Army, as he stated it, slept on the positions it held in the morning. The attack was renewed by the Prussians on Thursday, the 8th, "along the whole front." The fighting seems again to have been obstinate, and in the evening the French commander reported: "We held our position throughout the day. All the corps were engaged from St. Laurent to Beaugency. We encamp on our positions of this morning." Beaugency, however, as we learn from a later despatch of the Grand-Duke, was lost on that day, Meung having previously been occupied by the Germans. On the 9th, the French general made a violent attack on the Grand-Duke, but was "victoriously repulsed," according to the latter, whose report alone has as yet been received. Another German report, referring to this, or possibly to a more recent engagement, adds: "Fifteen hundred prisoners and six guns were taken. The remainder of the French army is on the road to Bourges, captured or beaten."

How decidedly the advantage in these engagements has been on the side of the Prussians, appears from the circumstance that on Friday, the 9th, the French Government at Tours seriously began the evacuation of that temporary capital, which is now replaced by Bordeaux. That no spot nearer to the theatres of war has been selected shows how little Gambetta relies upon General Chauzy's army, in spite of its "continuing to resist the attacks of Prince Frederic Charles, taking many prisoners, and inflicting heavy losses on the enemy." Nor has General Bourbaki, commanding the First Army, been more successful. After a slight attempt, as appears, at a diversion in favor of Chauzy and Tours by a forward movement in the direction of Montargis, this army speedily entered upon a full retreat, in which its rear-guard, according to a brief telegram, was overtaken and defeated at Nevoy, northwest of Gien, by the advance of the left wing of Frederic Charles's forces. The date of the affair is not given; nor do we hear whether the retreating army was attempting to recross to the south bank of the Loire, in order to cover Bourges, and still to co-operate with Chauzy; or whether its line of retreat was yet towards the southeast, in the direction of Nevers or Autun, where it would join the forces opposing Von Werder's advance on Lyons. In the meanwhile, a rapidly advanced Prussian column, forming in a way Frederic Charles's centre, has occupied Vierzon, a few miles northwest of Bourges, and thus severed the communications between the two French generals.

Little is heard from the other seats of the war. Belfort and the other besieged fortresses continue to resist, and no headway is made by the Germans in Burgundy. Their success in Picardy, however, appears to have been more complete than at first reported, and Rouen to have fallen after considerable fighting. Dieppe has been occupied; Havre is menaced, and Cherbourg may soon be. Ham and St. Quentin, however, are reported reoccupied by the French. There is nothing indicating the intention, on the part of the French Government, either to concentrate a strong body of troops for the defence of Western Normandy and of Brittany, or to withdraw the more available forces now there to the south bank of the Loire, before the advance of the Prussians cuts off the communication between the two banks. Nantes, however, if well fortified, may for some time remain a connecting link—not to speak of communication by sea—if the continuation of the war *à outrance* be really resolved upon, in spite of the now evident impossibility of relieving Paris from without, and the avowed futility of the attempts made to break from within through the lines of the besiegers. Ducrot, who recrossed the Marne on the 4th, acknowledged, in an order of the day to his soldiers, that their "two days of glorious battles" had been "fruitless;" but he continued to hope for a more propitious time to renew the contest. This hope was not entirely abandoned when the news of the defeats on the Loire became known in Paris, for we hear of another sortie in force made and repulsed on the 10th. That this city is yet to be bombarded is again asserted, but the assertion is the less credible the later it is made.

We here, at least, know of no reason why King William or Bismarck or Moltke should, at this late hour, when famine has nearly done the work of reducing Paris, yield to the impatience of the Germans at home, and determine on or counsel an act so long avoided. Nor is it probable that the desire of speedily returning home, to complete the crowning of the work of German unification by solemnly placing the German Imperial diadem upon his head, can exercise any particular influence on the determinations of the old King. The acceptance of the title of Emperor of Germany, however, which the King of Bavaria took the initiative to propose, meeting with the ready concurrence of the Kings of Saxony and Würtemberg, has definitively been resolved upon in the council at Versailles, and the fact has duly been announced —in a somewhat autocratic way, we must say—in the North-German Parliament. This body has, after lively debates, finally sanctioned the treaties concluded with the southwestern states for their union with North Germany. All amendments to the treaty with Bavaria, some features of which were particularly obnoxious to the opposition, were rejected, in accordance with the distinctly expressed demands of Bismarck, who is said to have threatened to resign in case of non-compliance.

The news regarding the Russo-Turkish difficulty still continues to look pacific, in spite of very vigorous preparations for war on the part of Turkey, but they mean less than would appear. The very existence of the Ottoman Empire is at stake in all these disputes, and Turkey is obliged to keep up a large armament, very much as fire-engines are kept up in cities. In England there is apparently about equal readiness to fight and to keep the peace. The popular state of mind is very well described in our correspondent's letter, and is indeed what we ourselves ventured some weeks ago to predict it would be found to be. In fact, the taunts of the foreign press have at last succeeded in creating a state of mind in England which will probably at last plunge the country in war for some very trifling cause, thus adding another, and one of the greatest, to the list of these blots on our civilization.

Nothing is more certain than that the French press had a large share in bringing about the Franco-Prussian contest, and we have all been properly shocked by its performances. But when one looks at the press of other civilized countries, and remembers how largely the press now influences international relations, and how very small is the control retained over these relations in our time by professional statesmen or diplomatists, and sees how this difficulty between England and Russia has been treated by most of the newspapers, one can hardly help feeling that the devil has really gone into the newspaper business, and is now engaged as an editorial writer on many of "the great dailies" of the world. Everybody is sensible of the value of peace, and everybody is or pretends to be shocked by the horrors of war, and in no place does one find so many general denunciations of war in the abstract as in the columns of the press. But as soon as a particular war seems to be impending, if either of the parties to the quarrel shows the slightest sign of shrinking from the fray, he finds himself assailed with a chorus of taunts from all the editors of the globe. He is jeered at for backing down; his "decay" is declared to have begun; his loss of influence and his perpetual relegation to insignificance and obscurity are pronounced certain. His desire to decide the controversy by the human method—that is, a conference for discussion—instead of the tom-cat method—that is, the tearing and rending to pieces of thousands of men on the battle-field—is ridiculed as a sign of pusillanimity, and, in fact, everything is said and done that Old Nick himself could suggest to lash the two hostile communities into fury and bloodshed. This is precisely the process which is now going on about the Anglo-Russian dispute. The neutral press generally, instead of hailing with delight the reference of the dispute to the decision of human reason, expressed in the debates of a general congress—a practice which offers the civilized world its only chance of final escape from war—treat it as a sign of cowardice on one side or the other, and draw inferences from it as to the national future which make it very difficult—human nature being what it is— for either party to keep the sword in the scabbard.

A country in which failure on the part of the mails to deliver exchange newspapers may be confidently laid to the confiscation of them by Government, has, at least, so much felicity to offset its peculiar trials. Italy is the country we have in mind, and the incident, the forfeiture of the issue of the *Unità Cattolica*, containing the latest Papal encyclical. The acquisition of Rome, as we recently pointed out, led the Government into some anomalous modifications of the press laws for the especial benefit of the new province, with a view to protecting the Pope from local disrespect in newspapers and pamphlets. The journals of the rest of the peninsula unanimously condemned this arbitrary proceeding, and argued the futility of it, inasmuch as they could print what was forbidden to the Roman press, and still circulate in that territory. But they appear to have reckoned without their host. The unhappy fate of the Catholic organ above-mentioned was speedily shared by the Florence journals, the *Opinione* and *Nazione*, which had reprinted the encyclical with a little flourish, as a proof that the Pope was not the prisoner that he pretended to be, and could get a hearing in any of the Italian journals. There was in truth nothing in the contents of the document to justify repression, let alone the question of legality, as the Pope simply rehearsed his old anathemas, and quoted Scripture for holding on to his vineyard. To be logical, as has been wittily remarked, the Government should not have stopped short of the Pope himself in its prosecutions, since, according to the statute, not only is the poor devil of a *gerente responsabile* liable for an abuse of the freedom of the press, but also the writer who signs his name to an offensive article —who, in this case, is no other than the Holy Father himself.

It appears that the long agony with regard to the English mission is over, or nearly over. Mr. Schenck has accepted, or is very likely to accept, the post; and we must say that, if he does accept it, it will be a more satisfactory ending to the difficulty than we had hoped for. Mr. Schenck is a man of great ability and good sense, and, if it fell to his lot to negotiate a settlement with England, would do it creditably and satisfactorily. His qualifications for the general duty of representing the nation at a foreign court, supposing that duty to consist largely in the maintenance of American influence, are open to more question. He has, we believe, but little experience of foreign life, or manners, or ideas, and would probably prove a protestant rather than a propagandist; but it is quite certain he would get us into no scrape, and that neither the honor nor the repute of the country would suffer in his hands. When one thinks, too, of how the place might have been filled, one can hardly help feeling thankful at the prospect of his taking it. His acceptance will be a tremendous blow to the protectionist interest in Congress. He is their Bismarck and Moltke in one.

THE TREASURY REPORT.

The Annual Report of the Secretary of the Treasury, just submitted to Congress, is a dreary and unsatisfactory document. It furnishes evidence of the industry of Mr. Boutwell, in giving some thought or attention to each of the different departments of public business under his charge, and it shows that these departments are of the most multifarious character. In collating the report for future reference, we find that no less than thirty-seven different topics are treated of, which, for our own convenience, we classed in two principal groups: those that belong to the Treasury Department proper, and those that, although officially appertaining to that office, really seem to have no business there. It is, for example, difficult to understand why that part of our navy which is employed in assisting the revenue service at sea should be under the command of the Secretary of the Treasury, any more than that portion of the army which is frequently called upon to do similar duty on land. Why it should *not* be, and why, on the contrary, it should be a mere part of the navy itself, must be evident to every one. It is in the same way difficult to see why the coast survey and the lighthouse service form part of the Treasury Department, for, although remotely connected with the commerce of the country, which is traditionally supposed to be under the care of the Treasury, it is nevertheless evident that the connection is mainly an imaginary one, and that both belong more directly to the Navy, or even to the Interior—to anything, in fact, but to the Treasury. Why the Commissioner of Mines should have been instructed to report to the financial secretary is another anomaly; especially in view of the fact that his labors would, on the one hand, directly benefit, and on the other be vastly aided by, the similar work constantly going on in the Land Office of the Interior Department. Still more absurd does it seem that the Treasury should be burdened with the charge and management of the marine hospitals; and why, finally, the one hundred and twenty-seven larger and smaller public buildings belonging to the General Government, and costing over thirty-six millions of dollars, should not be given in charge to the army, who have built a large number of them, and might have built them all to great advantage, or to a board of public works, or to the Interior, or, in fact, to anybody save the Secretary of the Treasury, is only explicable by a reference to the history of all these various institutions, which sprang from insignificant beginnings, in times when the Treasury had little to do save to divide the annual surplus revenues among the States, and all new work fell naturally to its share.

We do not propose on this occasion to point out the evils which arise from this unsystematized multiplicity of public business. We mention it rather as a partial explanation of the fact that this long report, referring to so many different things, has so little to say about the real business of the Treasury: the collection and disbursement of the national revenues. Of course, we have the usual figures of receipts and expenditures, with the glorification over the annual surplus of $101,000,000, and the reduction of the average gold premium from 133 to 115; but for a recognition of the fact that a very serious and widespread dissatisfaction exists with the methods of raising that revenue, or for suggestions as to the possibility of decreasing the expenditures, we have searched the report in vain. We do, indeed, find an assertion that the expenditures and receipts of the current year are so nearly equal, that a serious check to business would reduce the revenues *below* the necessary expenditures; but the assertion is so evidently put forward as a silent plea in favor of a continuance of the protective policy, the growing opposition to which the Secretary prudently ignores, as to deprive it of much of the consideration to which it would otherwise be entitled. To a people revelling in the vague delight of an almost boundless surplus, and utterly confused by an unceasing reiteration of ever-varying methods of computing its magnitude, this official announcement from the head of the Treasury may, however, well be worth a moment's thought. It is true that the figures, as presented by the Secretary, are unintelligible to any one save a clerk in the Department, for of the total expenditures of 309 millions, nearly one-half, 132 millions, are set down under the rather indefinite head of "permanent appropriations." But of the figures which furnish opportunity for comparison, almost all show a reduction of expenditures over last year, while the interest, probably included in the permanent appropriations, has, we know, been reduced ten millions and more. In fact, Mr. Boutwell admits that even upon his figures a reduction of the debt during the present year of fifty millions may be relied upon, and yet he does not hesitate to assert that the expenditures are "so nearly equal to the receipts as to justify and demand the greatest caution in dealing with the revenues and the business of the country," and that "a serious check to business would reduce the revenues below our necessary expenditures." Contradictory as the statements appear, it is evident that Mr. Boutwell's real faith attaches to the fifty-million surplus, and that the other figures are put forth for the purpose indicated.

But we are inclined to think the Secretary's pretended belief far more nearly correct than his real belief. The "prosperous condition of the country," which he so gravely attributes "to the revenue system inaugurated during the war"—as though taking money out of the people's pockets could possibly enrich them—we have repeatedly shown to be a delusion, to which the people have clung with an almost ineradicable tenacity, but from which they are beginning to cast loose at last, little by little. Mr. Boutwell must have profited little by his trip among the people if he has returned with the conviction that they are prosperous. There is to-day more discomfort and distress—for our people do not starve outright under the most unfavorable circumstances—but more genuine discomfort from straitened means and compulsory economy among the bulk of our farmers, than there has been since 1857. The complaint from the Northwest is particularly general, while the disturbances in the whiskey, pork, and meat trades are affecting the more Southwestern States very seriously. In the Atlantic States, we have repeatedly called the attention of our readers to the unusual frequency of strikes and labor suspensions, the majority of which have this fall been due not to increased demands from the workmen, but to a reduction of wages enforced by employers. Altogether, no dispassionate or well-informed person could at any time within the last two years have spoken, any more than he can to-day speak, sincerely of the prosperous condition of the country. But, whichever may be the correct view, it is important to know that Mr. Boutwell, believing in a prosperous condition of the people, does not anticipate a surplus in excess of fifty millions during the current year, and this should be allowed to set at rest a large part of the enthusiastic calculations indulged in in various quarters as to the uses to which the surplus should be applied.

Another fact contained in the report is the total failure of the Secretary's funding schemes, with which readers of the *Nation* are already acquainted. The war in Europe furnishes Mr. Boutwell with a good excuse for his failure, but the real cause is found elsewhere. He says "the large revenues of the Government enabled the Department, by weekly purchases, to reduce the amount of surplus bonds offered for sale." What are these surplus bonds? They are bonds held by our own people, and constantly pressed for sale upon the market, because there are no buyers of six per cent. bonds at par. Yet, when our own people were ready sellers of six per cent. bonds at par, and Europeans scant and slow buyers, and the Treasury purchases alone prevented the abundance of sellers from depressing these six per cent. bonds *below* par, Mr. Boutwell was allowing himself to be deluded into the belief that he could by some hocus-pocus induce people to buy four and four and one-half per cent. bonds by the thousand million and pay him par for them. And, not satisfied with this failure, he urges upon Congress to give him authority to issue three hundred millions more of five per cent. bonds, to try the same experiment a second time.

One more fact of importance gleaned from the dreary waste is the utter failure of the Currency Bill passed during the last session. Of the 57 millions of new currency authorized to be issued, only three millions have been called for, showing clearly that the new currency was not wanted. A large number of charters were, however, applied for, but without depositing the bonds required, showing, with equal clearness, from what class of persons the urgent demand for more banking facilities came, and that what was really needed by the parties applying was not "currency," which the Government might furnish, but "capital," which is produced by the people alone. There are some other suggestions in regard to the national banks which deserve attention. The highly unsatisfactory condition of the notes of some of these banks is bitterly complained of by the people. The banks have no interest in issuing new ones; on the contrary, nothing would please the issuers better than to see them wear away entirely. But the people, who are compelled by law to pay the banks very liberally for the use of their notes, have a right to demand that these notes should be kept decent by frequent exchanges. Mr. Boutwell proposes to comply with this just demand by reprinting these notes in the Treasury Department, *and at the public expense*—a proposition that seems almost incredible. The suggestion to prohibit the banks from paying interest on deposits is too technical to be considered here; but there is coupled with it a remark which acquires importance from the fact that it appears a second time in a different connection entirely: "It is no doubt true that Treasury notes, representing an equal amount of public debt without interest, are the most economical circulation for the Government," and "should the present system of furnishing a paper circulation, partly by the Treasury and partly by the banks, be continued, or the entire circulation be furnished by the Treasury," etc. Is Mr. Boutwell prepared to recommend the substitution of greenbacks for the entire national bank currency? Or is he cognizant of Congressional movements in that direction, and unwilling to commit himself? Or is he merely throwing out a hint to the banks that they had better submit gracefully to his funding schemes, as far as they affect the banks, and not wait until he does recommend a measure they would relish so little? Mr. Boutwell is too astute a politician to throw out hints of this kind without an object, but what the object is we fail to discover.

On the whole, we must feel thankful to Mr. Boutwell for his report. For, if he has not furnished much matter of interest, he has touched upon many topics; and, if he has touched on many topics, he has, at least, spared us the essay on shipping, the dispute on the balance of trade, and the last suggestion for the resumption of specie payments.

MR. BOUTWELL'S LAST EXCUSE.

Mr. Boutwell's utterances on the Civil Service in his reports confirm what we recently said as to his belief in the value of the present tenure of office of the employees in his department; but he recognizes the absurdity of having the examining boards composed of the officers of the department, and subject to the orders of its chief. He approves, on the whole, of the system of examination, but endeavors to save himself and other politicians from the full effects of its operation by a very ingenious statement, the nature of which it is a public duty to expose. He says:

> "It is well understood, however, that no examination can furnish security that the person examined will prove satisfactory upon trial, and there should always be a speedy and easy method of removing such persons from office. I do not, therefore, accept the idea that the tenure of office for the clerks and employees in this department should be changed. Indeed, I believe that the present tenure of office furnishes the best security which the people of the country can have that the business of the Government will be efficiently and properly performed. The work of the Treasury Department does not differ essentially from the business done in the banking-houses and merchants' counting-rooms, and there is no reason why the tenure of office should be permanent in one case that does not apply with equal force in the others. Speaking generally, it is a misfortune to a young man who possesses even ordinary capacity for business or labor to remain in the public offices of this city. It is, however, true that many of the most valuable clerks in the Treasury are young men who are pursuing professional studies, or who, having completed the course, remain from one to four years in the department, with the purpose, by industry and economy, of securing a small amount of money with which to commence an active life elsewhere. A system of life-tenure would exclude all these men from the service, unless they chose to accept it as a permanent pursuit, which in the main would be an injury to them and to the country. I am also fully convinced that any more permanent tenure of office would materially impair the efficiency of the revenue system. There are many thousand men employed in the Customs and Internal Revenue service, and however careful the preliminary examination might be, the evils which now impair the efficiency would undoubtedly exist. No system of examination could exclude all those who are dishonest, or who, under pressing necessity or the offer of sudden wealth, might yield to temptation. It often happens, and it would happen under any system, that men are found who are honest, temperate, and apparently capable, and yet lack the energy or the courage essential to the enforcement of the revenue laws—a duty which often requires sagacity and a kind of intelligence too subtle for discovery through formal questions."

Now it is quite true that the work of the Treasury Department does not differ materially from the business done in banking-houses and counting-rooms—a fact to which the friends of civil service reform are constantly calling attention. But the inference which Mr. Boutwell apparently wishes the public to draw from this is, that he and his successors are likely, if let alone, to superintend this business in the spirit in which a banker or merchant superintends his. Nothing could well be more misleading than any such supposition, and it is because this supposition is grossly at variance with the facts that the cry for civil service reform has any strength. Mr. Boutwell, for instance, believes places in the Treasury should be distributed—so far as is consistent, he would say, with fitness—as a reward for party services; but if you went to Brown Bros., and asked for a place in their banking-house for a young man on the ground that he had been two months on the stump at the last canvass, and was recommended by the Chairman of the State Committee or Horace Greeley as a "sound" and deserving person, they would laugh at you. If you then took the same man to Mr. Boutwell, with the same claims, he would work might and main to make a place for him. So, also, if the Chairman of the State Committee or Senator Fenton went to Brown Bros., and said that their book-keeper was opposed to the Fifteenth Amendment and made no secret of it, and that they ought to dismiss him, they would probably show the Chairman and Mr. Fenton the door. In other words, they exact nothing of their employees but honesty, capacity, and diligence, and if they get these are satisfied, and these men are sure of their places. They know well that if they attempted to conduct their business in the way in which Mr. Boutwell conducts the Treasury, they would speedily be bankrupt; and if the Treasury and other departments of the Government could be so managed that a penalty analogous to bankruptcy would overtake the heads as the consequence of the employment of improper or incompetent persons in the discharge of the duties, there would probably be little need to call for civil service reform. But the Government differs from private firms in this: that let the extravagance, carelessness, and dishonesty of its officials be what they may, the natural result is prevented by contributions levied on the people under the name of taxation. When Mr. Boutwell balances his books, he shows how much the people gave him, and how much he has spent; he does not show, as Brown Bros. do, how much he has won by close attention to business, by careful selection and judicious encouragement of his servants—and how much he has lost by his errors of judgment or the frauds of their agents or customers. Consequently, although the nature of the business transacted in the Treasury and the banking-house are much the same, the checks on the managers are very far from the same. Mr. Boutwell does his work partly with the view of "helping the party," and partly of meeting the public obligations; Brown Bros. do theirs under the influence of one motive only—making a profit on the capital employed; and this is the reason why the country needs to look after Mr. Boutwell, and does not need to look after Brown Bros.

It is quite true that the competency of a man for a particular office cannot be perfectly ascertained by examination. Nobody ever maintained that it could. All that is claimed for it is, that it tests fitness to *a certain extent*. What is said against the present system—recommendation by Congressmen—is that it is no test at all. It is also quite true that a man may pass a very good examination, and yet from moral defects—want of nerve, or vigilance, or punctuality, or perspicacity, may prove unequal to the proper discharge of his duties. It is, therefore, a very wise regulation of the English civil service which puts every candidate on probation for six months, even after he has passed a successful examination, and a wise usage which leaves it in the power of the heads of departments to dismiss employees arbitrarily. But then this discretion is safely confided to English chiefs of departments because it is exercised under the control of another usage, which has almost the force of law, so long established and so firmly supported by public opinion is it, which forbids the dismissal of any man except for glaring misconduct or inefficiency. The reason why we are unwilling to see Mr. Boutwell left in possession of any such discretion is that we know he believes that offices should be used to help the party—that this means that Congressmen should be allowed to demand places for their political hangers-on and get them, and that vacancies should be made for these hangers-on by dismissing the nominees of other Congressmen whose course is unsatisfactory to the Administration—witness the recent Federal interference in Missouri—or whose opinions are discovered to be "unsound," who are therefore held to have been long enough in office. For instance, he naïvely acknowledges that, since March, 1869, 654 Treasury clerks, out of a total of 2,143, or about 30 per cent., have been dismissed. Nobody believes that these were dismissed for incompetency, or that their places have been filled by more efficient persons, or that in the vast majority of cases the change has not been made to satisfy political "claims."

For Mr. Boutwell, under these circumstances, to object to any fetters on his discretion, on the ground that his position is like that of the head of a banking-house, is really trespassing a little too far on public forbearance. When we get rid of the present system, which, without any abuse of language, we may fairly call infernal, and Congressmen have lost the habit of touting for offices, and heads of departments have really grown into the way of regarding themselves as the servants of the American people and not as the agents of the party in power, charged with the duty of controlling elections, we may fairly leave them a large amount of discretion in the matter of dismissal. But unlimited power of dismissal in their present state of mind, and with their present political habits, would make the system of examination a farce.

One other consideration evoked by Mr. Boutwell in opposition to tenure during good behavior, it is impossible to weigh without a smile. He objects to such tenure as likely to keep out of office young men who intend ultimately to follow other pursuits, but would like a short term in the Treasury "in order to save a small amount of money with which to commence an active life elsewhere." "A life tenure," he says, "would exclude all such men, unless they chose to accept it as a permanent pursuit, which would be, in the main, an injury to them and to the country." Now, fancy Brown Bros. & Co.—the comparison is Mr. Boutwell's own, and we hold him to it, for nothing can be apter or more just—announcing that their clerkships were held for the benefit of young men wishing to save a little money to enable them to go into the ministry, or the law, or other pursuits afterwards, and that the clerks would be "rotated" out of them after short terms of service, lest their fondness for the places should tempt them to remain in them permanently, and thus do "injury to themselves and the country." There never was a truer thing said than that it is impossible to be a first-class politician without a sense of humor.

The Boston *Journal* has recently come to Mr. Boutwell's defence, against the *Nation*, with the suggestion that our asking for a sight of Mr. Boutwell's "examination papers" implies that we consider him a "knave." No more than our asking for his monthly or quarterly accounts. He is surely not going to stop publishing his Treasury statements, like our own New York Comptroller, and, when we ask him for them, enquire of us if we doubt his honor, and refer us to his old constituents of "the ancient town of Groton" for testimony as to character. One of these days we shall, it would seem, witness a refusal on the part of the judges to give the reasons of their decisions on the ground that it was insult to subject them to any such test of honesty; that the practice after all did not secure purity—witness Barnard and Cardozo; and that the only way to keep judges straight was to put none but good men on the bench. We are assailed every day with statements showing that our proposed machinery of reform would not "work." The *Journal* says it would not "work." But what *does* "work" as it ought to work, brethren, in this vale of tears? Do the courts and police not work because men go on disputing and thieves go on stealing? Does religion not work because sin endures? Should we not, on the Boutwellian theory, desist from all our efforts after a better civilization, take off our pantaloons, and go to the woods with bows and arrows? Rifles miss fire, power-looms turn out bad goods, book-keeping by double-entry does not prevent fraud, preaching does not stop vice, the jails do not prevent crime, and civil service examinations, says Mr. Boutwell, would not "exclude all those who are dishonest, or who, under pressing necessity or the offer of sudden wealth, might yield to temptation." This astounding revelation, coming, at this season of the year, when the system is naturally depressed by the rapid change in the weather, we fear will produce calamitous results, and crush out hope in many large centres of population. What is the use of striving, people will ask, when there is no means of excluding wicked men from the Treasury, or robbing "the offer of sudden wealth" of its temptations for "young men pursuing professional studies?" To say that the man who found this out deserves to be President is but a small tribute to him; the Popedom at least is his due.

RECENT DEVELOPMENTS IN INTERNATIONAL LAW.

The late civil war was the occasion of much diplomatic discussion upon topics connected with international law; but when the enormous mass of correspondence issued from the American and British Foreign Offices is carefully sifted, it will be found that a very few new questions were mooted, a very few new claims set up, a very few changes suggested. The positive rules which had been acquiesced in for generations, and which had acquired the authority almost of municipal law, were recognized by all parties. Through the entire period of its existence, up to the breaking out of the rebellion, the United States had been the champion of neutral rights, the advocates of a free neutral commerce. Although during the long struggle with the French Republic and Empire and their allies Great Britain had steadily advanced and upheld the claims of belligerents, and in her public acts and diplomacy, in the judgments of her prize courts, and in the writings of her jurists, had labored to keep the rights of neutrals within narrow bounds, a subsequent change in her domestic policy, and a complete devotion to industrial pursuits, had wrought a corresponding change in her interpretation of those portions of the international code which relate to the condition of war. The tendency of theorists was in the same direction. The principles advocated by Hübner had been adopted by all Continental and by many English publicists, and had been pushed by not a few French and German text-writers to an extent which would have nearly destroyed all maritime warfare except that waged against armed vessels and that carried on by means of blockades. Finally, the Treaty of Paris, in 1856, had crowned the work, and had established neutral rights on a firm basis of compact between all civilized nations; for although the United States did not become a signatary of that treaty, it declared its intention of conforming to its stipulations.

American diplomacy did not endeavor, during the civil war, to overturn any of these established doctrines, so favorable to the country in time of peace. No charge was made against Great Britain for the enormously developed propensity of her subjects to trade in contraband and to evade the blockade. We conceded at once that our only redress was against the individuals engaged in the illicit traffic, and that if *we* could not inflict the penalty of seizure and confiscation, the offenders must escape all punishment. The points of controversy were three. It was urged, first: That the British Government violated its neutral duty by suffering a vessel to be constructed and to escape ready for naval service in all particulars except her guns and crew, which were immediately supplied, in accordance with a previous arrangement, by another ship also sailing from an English port. This exact point was new, and there was room for doubt whether it was embraced within any established principles. But all opposition to the claim has now been withdrawn, and the only matter in dispute relates to the amount of damages. Secondly: That the British Government violated its neutral duty in recognizing a status of belligerency. This complaint was afterwards restricted to the alleged fact of prematureness in the recognition. As we understand the acts of our own Administration, it has abandoned its position altogether by a formal avowal of the accepted doctrine that recognition is a matter for each neutral nation to decide for itself. Thirdly: That the general sentiments and opinions of the English people, and the personal sentiments and opinions of members of their Government, were hostile to us, and that thus an international wrong was done calling for some sort of international reparation—the particular kind of relief not exactly determined upon as yet. This charge figured quite prominently at one time in our diplomatic correspondence, but, we are glad to believe, has now been given over to declaimers in Congress and upon the stump. It would seem, therefore, that the positive international results of the great civil war have been (1) to leave the doctrine of recognition just where it had been established—established, in fact, chiefly by our own governmental practice: (2) to start and settle a new and nice question in reference to the liability of a neutral for suffering a vessel of war to be despatched under very peculiar circumstances in aid of our belligerent: and (3) to create a certain feeling of discontent with the exhibition by a neutral people of personal sympathies opposed to our cause.

The terrible contest between Prussia and France has given rise to some further discussion of rules that had long been treated as fixed, and has brought to light a tendency to question if not to overturn doctrines which had been regarded as fundamental. We had occasion in a former article to criticise the action of Prussia in declaring for freedom of belligerent commerce except in contraband articles. We then spoke of King William's proclamation as a bid for popularity. Subsequent events have shown that in this departure from the universal customs of war the North German Government was guided by no principle, but was vainly endeavoring to obtain for itself a great advantage by the surrender of a right which it could not enforce. In his recent communications to the British Cabinet, the German Secretary of Foreign Affairs has taken a position the effect of which would be to enlarge the rights of belligerents, and circumscribe the privileges of neutrals, in a manner and to an extent not before assumed by any nation in modern times, not even by England while sweeping the seas at the close of the last century and the beginning of the present, and destroying all commerce except her own. It is laid down by jurists that during a war neutral governments must not aid either belligerent. This prohibition extends not only to all positive acts of material assistance by means of troops, arms, and vessels, but to many permissive acts and even negligences. These latter include, among other things, enlistments of troops either singly or in bodies by foreign agents, voluntary organizations of inhabitants departing in aid of one of the combatants, and the construction and despatch of vessels armed and equipped for a like purpose. It is equally well settled by the authority of text-writers and by the universal practice of mankind, that the citizens of neutral countries may carry on an unmolested commerce in articles not contraband with hostile ports not blockaded. The Treaty of Paris extends this immunity to similar goods of an enemy transported in a neutral bottom. Finally, the citizens of a neutral country may trade in contraband articles, and evade or attempt to evade a blockade, if they are willing to run the personal risk and suffer the personal penalty of seizure by the cruisers and confiscation by the courts of the nation whose purposes are thus interfered with. Such persons do not break the laws of their own Government, nor is that Government at all responsible for the injury they do to one enemy by conferring material aid upon the other. If any doctrines and rules of international law are to be considered as settled beyond dispute upon foundations of common consent and general public policy, these are. But Germany for the first time disturbs this unanimity, and would throw all our notions of inter-state rights and obligations into confusion. English subjects are engaged in an extensive exportation of coal, arms, ammunition, and other warlike material to the French. These articles are contraband, and liable to seizure and confiscation. But the French ports are open, and the sea is free from German cruisers; the traffic, therefore, goes on unmolested. Not possessing a navy sufficient to prevent the transit of such goods, Germany now demands that the British Government shall interpose and put a stop to the practices of its subjects, and asserts that the British nation is violating its neutral obligations by permitting the illicit commerce. We repeat, this claim is unprecedented, and would overturn all international rules in respect to belligerents and neutrals. During the agony of our struggle with the rebels, while whole industries in England were employed in evading our blockade, the Secretary of State laid no blame for all this at England's door. Since the downfall of Napoleon, the changes in international law have been favorable to freedom of neutral commerce. Germany would turn back this benign movement, and would make the condition of neutrals far worse than it ever had been, for she would impose the penalty of war upon whole peoples for the neglect of their rulers in not repressing the trading energies of a few private citizens, whereas the only penalty has been and now is a loss sustained by those persons themselves who choose to accept the risks consequent upon the traffic.

It is the duty of all nations, and especially of the United States, to protest against the introduction of any such new dogma into the code of the civilized world. It is easy to say that the intercourse of states should be governed by exactly the same maxims of right and justice as those which regulate the affairs of individual men. But there is no analogy. The laws which control individual men are uttered by a superior, can be enforced by compulsive sanctions, and thus we can be made to square our actions with notions of abstract right. The rules by which nations profess to be guided are uttered by no superior, can be enforced by no sanction, are voluntarily obeyed. They must, therefore, be such as all states will adopt, and must often spring from motives of public policy rather than from considerations of absolute justice. Some foolish people, influenced by sentiment rather than by reason, may object to our statement, and condemn it as immoral. The answer is, that if international law were not based in part upon the foundation of public and state policy—of interest—there would be no such law, and the external affairs of the civilized world would fall into chaos. It needs no argument to show that the doctrine suggested by Prussia would be against public policy, and contrary to the interests of nations generally. In any given war, most states are neutral. If they are to be responsible as such for the ordinary contraband traffic of their citizens, they will at once become, in a certain sense, parties to the hostilities. The act of war between two countries will extend its immediate repressing *governmental* effects over the entire world, and will subject whole peoples to risks and dangers from the speculations of a very small class. War is bad enough between the two belligerents; but a rule which would tend to draw all other communities into the conflict would be opposed to the best interests of mankind, would be contrary to the public policy of Christendom, and would be a step back towards barbarism. The peace of the world demands that the rules which regulate the conduct of nations when once established on a proper basis, should remain fixed; they should not be controlled and varied by the swayings of popular sentiment. Experience shows that such sentiment is as apt to be vindictive as kindly, is as likely to urge violent and outrageous measures as to mitigate the evils of war. The doctrines we advocate *are* established upon a proper basis. Dictated by public policy, they have also the higher sanction of Christian morality. The right to sell what the seller has and what the buyer desires is a natural right; the advantage which one country possesses in its sea-coast, ports, and facilities for commerce is a natural advantage. War does not destroy the right nor the advantage. A belligerent may by force of arms interfere to a certain extent with both when used for the benefit of its enemy, but the mere status of war affects neither.

THE ANGLO-RUSSIAN DIFFICULTY.

LONDON, Nov. 25, 1870.

I WRITE to you with a more painful feeling than I have ever known on a similar occasion. We are at the present moment in suspense as to the possibility of a war with Russia. Before you receive this letter the die will have been cast, and any speculation as to the probable turn of events would therefore be useless. There is only one subject upon which I can dwell which is in the least likely to be interesting to your readers, and that is the state of opinion at present existing in England. Whether we go to war or not, it may be worth while to record the spirit in which the announcement of a probable war was received. To explain myself more clearly, I must try to point out the nature of the issues presented to us. Russia has, as you know, announced its intention to be no longer bound by that clause of the Treaty of 1856 which neutralizes the Black Sea. There is no appeal to the consent of the various powers which signed the treaty; but simply a declaration that it will no longer be recognized as binding. Everybody is, of course, agreed that this method of obtaining a relaxation of the treaty is in the highest degree objectionable. None of our newspapers, and none of the distinguished men who have expressed their views, have any hesitation upon this point. The next question is whether we should have been willing to concede the liberty which Russia proposes to take by force, if she had asked our leave, instead of taking it for granted. Upon this matter there is more difference of opinion; but I think the general impression is that we should have been willing enough to make the required concession. Finally, it is disputed whether, assuming Russia to be in the wrong, we ought to go to war to maintain the treaty. Those who maintain the concession to be in itself impolitic, are of course in favor of war. Those who think that it might wisely have been made, are divided into two parties. Some of them maintain that if treaties are in future to be respected, and national good faith to have any validity, we must fight to redeem our pledges. Others assert that, however objectionable may be the conduct of Russia, we should not be justified in causing the frightful amount of misery which must necessarily follow from war in order to resist a pretension which we admit to be not unreasonable in itself.

The most warlike party—that which objects both to the form and substance of the demand—is composed, in the first place, of the regular old British politician—the believer in Lord Palmerston; the gentleman who believes in the British Empire; who is great upon the necessity of keeping up our prestige, adhering to our traditional policy, and enabling every Englishman to go about the world saying "*Civis Romanus sum.*" I admire, in some respects, the patriotic spirit of this gentleman; but one could wish that his zeal were a little more according to knowledge. His grievous defect is a want of ideas, and a consequent desire to stick to positions which have now become indefensible, and to refuse to acknowledge facts. So far as concerns the policy of maintaining the Turkish Empire, and sacrificing every other principle to guard our communications with India, I think that they have ceased to represent the mind of the nation. We are thoroughly convinced, as a rule, that the Crimean war was a gross blunder. We do not wish once more to find ourselves committed to maintaining for an indefinite period the Emperor Nicholas's "sick man." We would withdraw, if we could do it honorably, from the hopeless task of propping up a power which is unmistakably doomed to fall into ruin. If only our statesmen had been sufficiently far-sighted, they would long ago have prepared the way for a change of front, and we should not have found ourselves pledged to preserve what is not preservable. But when we come to the question, Can we honorably withdraw? the problem is far more difficult. Here the staunch old Conservatives find themselves reinforced by a sentiment which is capable of leading us into great mischief, and which strongly reminds one of the feeling which was so prevalent before the Crimean war. The fact is that Englishmen are just now, and very naturally, in a touchy humor. We are under the impression that our pacific tendencies have lowered us in the general opinion of Europe, and we are nervously anxious to show that we are not cowards. Many people really wish to go to war, not because they think that great principles are involved, but simply to prove that we are not afraid of going to war. Our position as neutrals, in presence of the greatest contest that has taken place in Europe for generations, may have been judicious, but was certainly not dignified. We have been stung by the taunts that have been aimed at us from so many quarters, and wish to vindicate the warlike character of our race. This is the real difficulty of the situation in England. It is not sufficient to prove—if it can be proved—that the game is not worth the candle, because we are rather anxious for the game on its own account. We have become nervously irritable, and, after having submitted, as we think, to a good many slaps in the face, we are anxious to resent the next insult, even though it may plunge us into a doubtful struggle for a prize of very questionable value.

The most warlike representative of the press has been the *Pall Mall Gazette*. It is one of our ablest journals, and has, besides, a certain character for a political morality which is decidedly superior to that possessed by the *Times* or some other newspapers of larger circulation. It has, however, a certain affectation of seeing deeper into millstones than its neighbors, and the result of its insight into the profound political schemes of Gortchakoff and Bismarck is the advocacy of a line of policy which (as everybody says who aims at war) is really the only way of obtaining peace, but which, to more vulgar apprehensions, means simply that we are at once to accept the challenge thrown down to us. I will not discuss its arguments; but it is enough to say that it believes Bismarck to be the accomplice of Russia, and wishes to fight before Prussia is set free from the terrible struggle in France. The general tone of the Liberal press is more in accordance with the second line of policy indicated. It is really anxious for peace, and thinks that peace may be preserved; but it is influenced by that sensitive jealousy of our national honor which I have tried to describe, and is for inducing Russia to submit to a congress by a temporizing policy, the issue of which is more or less doubtful. Finally, a small band of Liberal politicians unreservedly advocates peace. Mr. Mill is the most conspicuous and outspoken of these gentlemen. He declares that war would be a crime, for which our Ministry would be execrated by the mass of the population; and that the conduct of Russia, however wrong, would not justify us in resenting it by an appeal to force, with all the miserable consequences that must necessarily ensue. The same position is substantially occupied by Mr. Froude, Prof. Cairnes, and Mr. Freeman. They are all of them men of deservedly high reputation, and, in my opinion, deserve the highest credit for their independent protest against the cry for war. They have, of course, been bitterly attacked, accused of a want of patriotism, and assailed with the ordinary vocabulary of a majority opposed by a small minority. For, I fear, it is undeniable that they are a small minority—at least amongst the upper classes. The mass of the country, doubtless, cares little for the Eastern question, and would be glad to keep out of the complication at all hazards; but I have no doubt that the large audience to which the *Times* appeals has its sentiments pretty well reflected in the columns of that self-styled leader, but real follower, of public opinion. The upper and middle classes, in fact, are as usual rather uncertain in their views, but incline towards a policy which probably means war—though a war adopted reluctantly, and with many misgivings. Few people share the warlike zeal of the *Pall Mall Gazette*—but nine men out of ten, speaking of the people whom one meets at clubs, at London dinner-parties, and in first and second-class railway carriages, are quite prepared to drift into war, with more or less dislike to the conclusion towards which they are involuntarily propelled.

And now, having tried to describe the state of public opinion generally, may I shortly give you my own? I confess that I agree fully with Mr. Mill. Whatever may be the rights of the quarrel, I cannot look forward without something like horror to the prospect of a war in which, as it seems to me, we should be fighting in behalf of an exploded policy, with no intelligible aim, in pursuance of no settled policy, and at the risk of all kinds of ulterior complications, which you will understand as well as I. A return of the Crimean war is, to my mind, a retrograde movement; and, as the original cause of quarrel will speedily be forgotten, I cannot regard, with anything short of disgust, the confused struggle into which we may soon be plunged, where the one distinct prospect is that of a reckless expenditure of money and blood. Am I, then, in favor of peace at any price? To that I must answer, that I do not believe that England will ever adopt a thoroughly noble line of policy, or recover the prestige to which she is fairly entitled, until we are more at one mind with ourselves. In the present condition of internal politics in this country, we have not, as a nation, any settled convictions. In the absence of genuine political faith, our conduct cannot be really consistent or entitled to respect. The *Pall Mall Gazette* would restore our character by adopting what is called a "vigorous foreign policy." I have no faith in the recipe. I believe that the vigorous policy must be a consequence, and not the cause. We have not yet finished our revolution; and, till we have got a little further, the conflict of opinions between the classes which try to retain and those which try to grasp at power leads to our describing a tortuous and uncertain line, from which little is to be hoped. If we had openly taken part against France at the outbreak of the war, or, if we openly took part against the Prussian claims at the present moment, we should at least know for what we were fighting, and why. But having, rightly or wrongly, insisted upon preserving our neutrality in a question of the deepest interest to the whole civilized world, we are now called upon to abandon it in defence of a cause which ninety-nine Englishmen out of a hundred condemn at the bottom of their hearts. It may be inevitable that we should pay the penalty of past follies by finding ourselves involved in this wretched dispute; but I shall be truly glad if, before this reaches you, it should have been rendered uninteresting by the disappearance of the danger to which we are now exposed.

PRUSSIA AND THE EASTERN QUESTION—THE NEW GERMAN CONFEDERATION.

BERLIN, November 28.

THE Eastern question has appeared and disappeared on the political horizon like a meteor. I write to you under the impression that it will not lead to a war. I do not wish to exculpate Russia's arrogant tone in breaking the Treaty of 1856. It, however, appears to me that humiliating terms like those imposed upon her by the Paris treaty should not be forced on a great power, and that, if it be done, we cannot expect anything else than that they will be repudiated at the earliest favorable moment. Such a moment had now come for Russia by the defeat of France. I can understand the moral indignation of England and of her friends, but I cannot understand that these same people had not a single word of reprobation against the provocation and violence of the reckless aggressors when within the last ten years—see the rebellion of the South against the North, France in Mexico, Napoleon versus Germany—similar solemn treaties were broken. England, for instance, with a little more moral courage, could have stopped the present war; now she earns the fruits of her sin of omission, and, being unable to resent the outrage thrust in her face, must try all in her power to settle the pending difficulties by diplomatic negotiations.

English as well as other papers have asserted that Russia had acted in concert with Prussia, and that Bismarck had instigated the whole plot. This statement is entirely unfounded. There exists neither a treaty nor an alliance between the two powers. At the outbreak of the present war, Gortchakoff promised Prussia a strict and friendly (*bienveillante*) neutrality. He has kept his word, and has thus prevented Austria from assuming a hostile attitude towards Prussia. Bismarck, of course, declared himself willing to reciprocate the favor, and promised Russia to assist her at the end of the war in her efforts for the abolition of the obnoxious clauses of the Paris treaty. These *pourparlers* took place in Berlin at the end of July last, and their result enabled Prussia to send her whole army into France. Grateful as Bismarck must have been for this proof of sympathy, there was, in fact, no man to whom, just at this moment, the news of the Russian note could be more embarrassing. If England and Austria had been prepared to enter into a war, France, through the complications of European politics, would have gained sufficient strength for a longer and more determined resistance, the end of the war would have been indefinitely postponed, and Prussia might have lost, if not all, at least some of its best fruits. At the conclusion of the war, Russia's claim would have obtained the support of Prussia if it had been properly suggested, but, under the *present* circumstances, it came very inopportunely. It does not require great political sagacity to appreciate the awkward position in which Bismarck has been placed by the Russian Chancellor's taking advantage of the annihilation of the French armies and the approach of the winter. Fortunately for Germany, none of the powers which have guaranteed the Paris treaty are prepared for war, and for this reason they all prefer a diplomatic mediation. Thus Bismarck is placed in the advantageous position of obliging and of securing for himself the friendship of those who, if it had come to a war, would have been his most bitter enemies. The London *Times*, the other day, had a telegram, which has since been confirmed, according to which Bismarck had proposed a congress to be held at Constantinople for the settlement of the Eastern question, excluding all other pending European difficulties. This settlement, in my opinion, can and will be easily effected, as the conflict provoked by Gortchakoff has not yet transcended the limits of diplomacy, and as there thus exists only a theoretical difference, which can still be answered by a theoretical protest, the more as Russia denies all hostile designs, and again and again affirms that she will respect the Paris treaty in all its other terms. English and Austrian papers, for a while, frightened each other into the most warlike state, describing the large fleet of iron-clads which Russia was said to have bought from the United States for the balance of the purchase price for Alaska, which, in fact, was paid long ago, and giving exaggerated accounts of the Russian army, which was only waiting for the signal to attack Turkey, while, in fact, Russia had very few regiments in her southern provinces, and has not called in a single man of her reserves; in short, they have depicted the horrors of a war which, thus far, exists only in the imagination of the excited newspaper correspondents themselves.

Another important proof of the continuance of peace is the fact that Bismarck alludes to the Eastern question in the address by which Mr. Delbrück, a few days ago, opened the Imperial Diet (Reichstag). It has never been the custom of the German Chancellor to introduce pending political questions into his official addresses and publications to the legislative bodies of Germany and Prussia. He certainly would have acted in accordance with his old policy if he had not felt sure that no war would ensue, and if he did not himself hold in his hands one of the ropes which would secure the European peace.

The Reichstag assembled on the 24th instant. Its present session will not last longer than about three weeks. It has been called for the double purpose of granting a loan of 100,000,000 of thalers ($70,000,000 gold) for the continuation of the war, which, to judge from the first two readings of the bill, will be passed with but few dissentient votes, and of ratifying the treaties just concluded by the North German Confederation with Baden, Southern Hesse, Bavaria, and Würtemberg. The two latter states were somewhat vacillating in the last hour of the negotiation, but partly by important concessions on the part of Prussia, partly by heavy pressure at home, and, finally, by the appreciation of the political necessity on the part of the South German rulers, a compromise has finally been effected. If you wish to understand these negotiations, with their intrigues and counter-intrigues, their expectations and disappointments and anxieties, and the final though modest realization of the national hopes, revert to the times of 1787 and 1788 in your own history, or rather the months preceding the adoption of your present Constitution. Contrary to the political superstition of the present and last generations, this Constitution was not considered by its framers as a model of perfection; on the contrary, it was a document of compromise, and not a single member of the Convention of Philadelphia was perfectly satisfied with it. With the greatest reluctance, the most patriotic and enlightened men were finally induced to sacrifice their principles to the practical expediency of a most important bearing. The great desire to emerge from the political chaos, and to create a nation with a real government, even led America's greatest statesman, Alexander Hamilton, finally to abide by the result thus gained.

The present condition of our political affairs is similar to yours at that time. The "Federalist" should be the text-book of every thinking political German of our days; but I doubt whether it is known to half-a-dozen of our public men. Similar conditions create similar consequences. The German constitution is just as indefinable as yours. The classic words by which Johnson (See Elliot's "Debates," iv. 523) characterizes your Federal Government, apply just as well to the new German constitution. "It is," he says, "neither strictly a confederation nor a national government, it is compounded of both; it is an anomaly in the political world, an experiment growing out of our peculiar circumstances, a compromise of principles and opinions; it is partly federal, partly national." Our state-rights men—we call them Particularists—are just as headstrong as were any representatives of your Slave States. What slavery was with them, ultramontane tendencies, bigotry, protective tariffs, a theoretical persistency and radical theories, are with us. Bavaria and Würtemberg, to the very last moment, seemed eager to follow the example of North Carolina and Rhode Island; little Hesse, for a time, played the rôle of New Jersey; only Baden acted nobly and wisely. The less important the states were, the more impudent were their demands, until, finally, the predominating interest of self-preservation made them accept the terms, which are by far too good, too favorable, and therefore quite incompatible with the vital interests of the nation. Why should I speak of the defects of the new constitution? It is far more insufficient by what it does not contain than what it says. There is no responsible head, neither prince nor minister. Prussia, as the leading and central power, has lost her preponderance by only retaining her old number of votes, and adding to those of the others (newly acceded) members, by giving up her exclusive right of declaring war and of execution and sequestration in cases of disobedience to the decrees of the Confederation. On the other side, press and public meetings are subjected to its laws, which in all probability will be more severe than those of the single states; in short, the present constitution robs the central power of some of its most important attributes, giving too much strength to the smaller states, and invests it with some obnoxious powers. Bavaria is independent in the command of her army, her fortresses cannot be garrisoned without the special permission of her king; Würtemberg keeps the post and telegraph administration under her exclusive control; Baden retains the gambling-tables at Baden-Baden.

In spite of all these objections we must accept, and the Reichstag will accept the new constitution, however imperfect it is; and from January 1, 1871, the *North German* will make room for the *German* Confederation. The first desideratum to be accomplished is a national existence. It was high time that Germany should become united in her relations with other states. As far as numerical strength is concerned, even Bavaria was not absolutely required for the new Confederation; but, *morally*, her refusal to enter would have been detrimental to the new German Empire and to the whole civilized world. Witness the joy of Austrian and French papers when they heard of the rumors that Bavaria had made objections to joining the confederation. Her isolation would have been an ever-open wound on the political body, that would have been their point, not for stealing upon, but for operating against, German interests. Napoleon, for instance, would never have dared to assail us if a united Germany had stood in arms against him; he speculated on our disunion, as he himself admits in his late poor pamphlet on the surrender of Sedan. There is one great consolation in the present unsatisfactory state of our political affairs. Germany has been long on the down-side of the hill, now she is marching up again, and the people, as well as all our public men, understand that it is their duty to work with unrelenting zeal and energy until they have attained the same strength and union at home which, to the astonishment of the world, they now exhibit in their dealings with the enemy.

FRIEDRICH KAPP.

Correspondence.

A FINAL EXPLANATION FROM "YOUNG YALE."

TO THE EDITOR OF THE NATION:

SIR: On one thing all the persons who have spoken in favor of "Young Yale" seem pretty well agreed, that the practical restriction of the government of the college to Congregational ministers and their appointees is an evil. But why and how this is an evil has not yet been expressed in other than the most general terms.

Let me say squarely, at the outset, that I am unable to recognize a more useful man in modern society, or a more venerable character in history, than the minister of Christ's Gospel. Not only has he done his full share of humanity's work, and borne more than his full share of its sorrows, but he has been the chief conservator of knowledge, and is yet in many dark and bitter places the only centre of sweetness and light. But it is no disgrace to Socrates himself to say that he was not enamored of positive knowledge; and I fail to see how it can indicate lack of respect for any moral teacher to doubt whether the proper field for his usefulness is in the conduct of an institution whose principal objects are the pursuit and inculcation of positive knowledge. Even were clergymen, "as a class," indisputably superior to all other men, it would yet be nothing short of superstition to suppose that in that one class could be found the catholicity of knowledge and opinion required for the conduct of an university. But clergymen, so far from being the type of catholicity, are the only men in modern society pledged to confine their beliefs and speculations within assignable limits.

As to the habits of mind thus engendered in a clergyman there is this to be said, that, desirable as it may be for a teacher of religion to be bound to teach certain dogmas and to *make a profession* of holding them, the frame of mind bred by this sort of training incapacitates him for the work of an enquirer after truth. He *cultivates a bias* from the time he enters the theological school. A real university is a place in which philosophy is cultivated—that is, in which the best modes of seeking truth are taught, without reference to the consequences that may result from finding it, and in which nobody is pledged to take or keep any particular view of any question. The mere statement of this point shows how singularly ill-qualified clergymen are to preside over any such institution. They were the best instructors when they were the only men who knew anything, or when all truth was based on *authority*. They have ceased to be so since the spread of the Baconian philosophy, and every university in the world is making or has necessarily made an effort to fill their places with men who are not pledged to see the same things with to-morrow's light that they see with to-day's.

So much for general principles: now how is it with the facts at Yale? My remarks refer solely to the academic department, which is still, virtually, the college; although the liberal management of the Scientific School during the past few years has already made it a powerful claimant for sympathy and support. Its herculean growth consists entirely with the facts that the clerical corporation have had nothing to do with it, while under that corporation the academic department has stood still. The field from which to choose a faculty is narrowed within the religious tests, and no man whose intellectual habits are not those of dogmatic theology stands any chance of election.

As a specific matter, the principal intellectual test applied to a candidate for admission to the faculty is the "standing" with which he graduated, as determined by the record of his regular college performances. Here comes in a striking circumstance: A speculative, ingenious, originating cast of mind is apt to overleap the theological barriers, and hence is not beloved of the governing spirit at Yale. As a consequence, the principal factors in determining the "standing" of a Yale student are his merely acquisitive powers. So true is this, that it is a college proverb that a man who can take the valedictory (the highest honor instituted by the faculty) can seldom do anything else. Yet the same tests applied in giving the valedictory are applied in selecting the faculty. Now the power of taking in second-hand knowledge is proverbially incompatible with the power of giving it out. Such learned men as have been masters of the art of putting things have acquired their learning principally by original investigation; they have been inventors and discoverers, not mere scholars. Nothing needs more *ingenuity* than to dilute knowledge without souring it. Just that set of qualities which make a good *teacher* is the set uncongenial to the type of mind which keeps within the theological bounds of Yale. *What he knows, not what he can teach*, is the principal test in selecting a Yale professor. Is it strange, then, that some of the best known of them—admirable scholars and admirable men, are less interesting as lecturers and inspire less enthusiasm as teachers than the majority of successful men in the lower walks of the profession? Interest in knowledge for the sake of knowledge is certainly as infrequent among the students at Yale as at any average elementary school.

So much for the power of guiding intellectually with which the clerical influence endows the faculty. As to the power of guiding morally, I have to present two illustrations. Neither of them will convince anybody, for nobody ever is convinced by single arguments in religious questions. But they may serve to somewhat clarify the ideas of such persons as are ready to appreciate them as arguments. The first is the fact that, during the past twelve years, Yale College has been subjected to two of those periods of utter abnegation of the intellectual faculties (which it is a university's business to develop) and of unlicensed riot of the emotional faculties (which it is a university's business to regulate) known as "religious revivals." They were promoted in every way by the faculty. During the first, records were kept (perhaps not officially) of the "conversions," and every man not included in them was kindly but persistently importuned to participate in the emotional overflows. One of the most frequent arguments was: "Everybody else is doing it." In one class, every man, I believe, was "converted." Six months after the excitement was over, the debauchery in college was fearful—far greater than it had been since the Kansas troubles had eliminated the habits born of slavery. The class which had been unanimously "converted" took the lead. Yet in spite of this experience the faculty has since been capable of promoting another such convulsion, with substantially the same results. The second illustration is a conversation which I lately heard between a college officer and an alumnus: *College officer*—"We've had to let the college preacher go again. He's the second. We'll never have another. The professors will have to alternate." *Alumnus*—"Why?" "Because no one man can stand it!" "Why?" "Because the students pester the soul out of him. They detest all the compulsory religious observances, and any man specially identified with them is an object of opprobrium." "Well, what's going to be the upshot of it?" "It's hard to tell, exactly. Even the old men are, some of them, getting a little shaky about having religious attendance compulsory. You know evening prayers were given up after I graduated, without any apparent evil result. I think compulsory attendance at afternoon church on Sundays will go next. You see, here's the Scientific School, right by the college, flourishing like a green bay tree, without, apparently, considering religious matters any of its business. This makes the academic students impatient, and it makes some of the academic faculty a little inclined to think that, after all, religious matters may be best taken care of when they are left to take care of themselves."

On the details of instruction, the clerical influence has had a special adjunct. Yale College was founded (as were most colleges two hundred years ago) for the purpose of educating ministers. It is one of the very few colleges now eminent which still professes to be distinctly influenced by that purpose. Since the scientific generalizations of the last thirty years have come to play their part, absurdly limited as it is, in education, there has been a great change in the relative intellectual standing of students for the orthodox ministry. The average material now offering itself for this profession is of a very inferior grade. Of course there is occasionally an exception. This state of things is regarded as something strange. It is acknowledged by the churches, and remedies for it publicly discussed. It is natural, then, that at Yale the things taught and the ways of teaching them should have been sedulously adapted to the average intellect, and that less latitude of selection has been considered necessary than in the undenominational colleges of a similar (professed) grade. Now there are those who think that the natural purpose of the best schools is to train the best minds, and that there is no need of a splendid university to train your average man, though he should be welcomed to get there what he can without having the true objects subverted for his benefit. Professor Porter says, however, that even if the best occupation for a young mind, capable of being interested in the highest subjects, be not the almost exclusive study of Latin, Greek, and Mathematics, those husks of thought are, nevertheless, the best material for the average stomach to digest, and, therefore, should be the fundamental and almost exclusive fare provided by the highest non-professional schools. To the question, "Why not help the boys to *think?*" he replies, "Why, bless you, most of them *can't* think, and they must be put to doing what they all can do." And such is the Yale policy. But surely if the students are wise enough to be invited, as they constantly are, to announce themselves believers in a system of religion, they are wise enough for any subject within the grasp of human intellect. Yet all systematic consideration of the vital questions of man's relations to himself, to society, and to the universe is postponed till all the weaklings are prepared to absorb some dogmatic instruction regarding them, and then they are treated with a marvellous lack of symmetrical attention, lectured upon without discussion, or taught by rote from text-books by such lights as Whately, Paley, or Hamilton. As a specimen of the indifference to subjects requiring grasp of mind, take English literature, which, if it means the history of the development of the English intellect, is a subject of more importance than Greek and Roman literature put together. The intense difficulty of this topic is proved by the utter worthlessness of nearly all existing text-books. Hence there is double necessity that it should employ the undivided attention of a professor whose heart and soul are in the subject. This chair at Yale is filled by an able and enthusiastic practical politician, who, between the time of his graduation from the academic department and his election to the professional chair (some five or six years) was a practising lawyer, clerk of the Legislature, and editor of a political daily; who, since his election seven years ago, has made an unsuccessful (though by no means discreditable) canvass for Congress, and now is collector of the port of New Haven.

The indirect clerical influence on the relations of the college with the world outside is of a piece with the rest. As your correspondent, L. L. B., pointed out last week, the friendship of such men as Mr. Thomas Hughes with a college faculty affects the number of students applying for admission. But is there anything congruous between such boys' heroes (and boys' heroes are generally men's heroes) and the type of man who holds a professor's chair at Yale? Moreover, such things as success at the Worcester races affect the size of college classes. Can your Yale professor be imagined to encourage his boys, as his equally eminent brother at Harvard does, by occasionally running down to the boat-houses and going to Worcester? A most essential thing to the growth and well-being of a university is the residence near it of such universally recognized examples of general culture as Lowell, Longfellow, Holmes, and Norton; but it is true, both *à priori* and as matter of fact, that that type of man cannot survive in the theological atmosphere of New Haven.

You yourself have said, that when Young Yale is pushed to the wall, it cannot say what it wants. For one, I believe that it has pretty distinct ideas of what it wants, and that they can be expressed in some such terms as these: "We want a practical realization of the fact that, whatever may have been the rights and intentions of the founders of Yale College, the institution has grown to be a part of humanity's general heritage from the past, and that hence no order or condition of men has any right to the control of it, except as they represent in a broad and liberal way the best opinion of the time. We believe that as there must be a centre for this opinion, the proper centre is that body of educated men whose right and duty it ought to be to maintain their venerable *alma mater*, and guide her footsteps."

That it is possible to attempt this reform, or any other reform, in such a way as to defeat the ends sought, nobody denies; and nobody claims, as far as I know, that any suitable plan has yet been matured. But these are no arguments against the reform itself, and no sane man can believe that what has been successfully done in this way elsewhere, cannot be successfully done at Yale, if all will unite to deliberate upon the methods.

While very many of us believe that the probabilities are strong against a Connecticut Congregational clergyman being the model governor of a modern university, we are ready to admit that it would be as narrow in one of us to vote against him *solely* for that reason, as it would be for him to vote against one of us for not adhering to his creed. The application of religious tests, however remotely, is becoming recognized as a great obstacle in the path of education. The other leading colleges of the country are not denominational in any sense. Until lately, we have found it easy to believe Yale among them all *facile princeps*. We feel that she is losing her old position, and we believe that to regain it she must substitute for the policy which was proved good in the last century the policy which is proved good in this. A YALE GRADUATE.

[This absolutely closes the controversy, as far as we are concerned. The *College Courant* offers space, we perceive, for its continuance.—ED. NATION.]

"DOES PROTECTION PROTECT?"

TO THE EDITOR OF THE NATION:

SIR: "M." takes issue with me upon several points. First, he says he uses 90 to 120 tons of cast-steel annually, and that he is not conscious of contributing so liberally to the support of the Government as might be inferred from my communication. Also, that his steel costs him less than it did from 1857 to 1861, when his supply came wholly from Sheffield. Lastly, he admits that the tariff of 1861 raised the cost (? price) of steel, and helped to establish its successful manufacture in this country.

Second, he takes exception to the rate alleged by me as being imposed on steel, giving other rates as being correct, viz., 60, 37½, 32, 43, 39, and 30, averaging a little over 40 per cent.

As to this second point, I used a rate given me by an importer of steel, which "M." admits to be one of the rates, but I am entirely willing to correct my example, and my proposition will then stand as follows:

If a shop can be established with a capital of $20,000—for the manufacture of tools from steel—and *if* ten per cent., or $2,000, is a sufficient rate of profit to induce the establishment of such works—and *if* such shop shall use imported steel, costing $15,000, free of duty, and *if* the owner of the works shall pay thereon 40 per cent. duty, or $6,000, then the relation which the duty bears to the profit is 300 per cent., and it is equal to 30 per cent. upon the capital. So long as any foreign steel is imported, and the duty is 40 per cent., the user of such steel is at that relative disadvantage, if compared with his competitor in Sheffield, so far as he attempts to export the tools which are the product of his labor. But as the tool which he makes from steel is (or ought to be) taxed as much as the steel itself, in order that the tax-law may not discriminate against him, he, the user of the steel, adds the duty to his cost, and the home-purchaser or consumer of the tool pays such increased cost.

Now, as to the points first named, which are the material points upon which "M." takes issue.

"M." says he is not conscious that he contributes the amount of the duty to the Government. I never intimated that he did. When he buys Sheffield steel, as he says he sometimes does, he adds the duty to the cost, and becomes the revenue collector to that extent—being enabled so to collect by the duty upon tools.

He says the cost of his steel is less than it was in 1857 to 1861. This fact is not material. There have been vast improvements in making steel, and the absolute price ought to be lower. Competition either here or in England would have reduced prices.

The true question is, Does the steel which "M." uses now cost him more than it would if he could import it *free* from Sheffield? If it does, he is at the relative disadvantage which such excess of cost bears to cost free of duty; the duty imposed upon the tools similar to his made by his Sheffield competitor enables him to add the excess of his cost of steel to the cost of his tools, so far as home consumers of such tools are concerned; but, unless he has a great advantage over his Sheffield competitor in the application of labor and machinery to tool-making, he cannot export a dollar's worth of his product.

If, however, his steel costs him less than Sheffield steel would cost, free of duty, then the steel-maker can make no claim to protection upon any ground whatever.

Finally, "M." admits that the tariff of 1861 raised the cost of steel to him. If so, he, or the consumer of his product, was forced to pay a bounty to enable steel-makers to establish themselves; but as the steel-makers, in a memorial to Congress in 1862 or 1863, declared that steel-making was a substantial success in this country long before 1861, and as the steel makers of Great Britain demanded to be protected against the infant iron and steel-makers of the American colonies in 1750, it would not appear that such a bounty was much needed.

"M." may be perfectly willing to be taxed for bounty purposes, and to be unconsciously used as a collector of revenue, but it is doubtful, at least, whether such acts are within the proper functions of Government. At any rate, it may soon appear that the majority of the people do not believe any Congress can be elected that can so wisely assess such bounties, and distribute them to certain special branches of industry, as to be safely entrusted with that function.

Some one pays $3,000,000, and more, annually, upon steel and steel products. This tax is added to the cost of the home production of all articles into which such steel enters as a component element. It is a tax upon processes of the most injurious kind, to be defended only upon the plea that the Government cannot dispense with it—a plea which cannot now be raised.

E. A.

To the Editor of the Nation:

Sir: Your correspondent, "M.," of Middletown, in his letter published in your last issue, is deceived by the common fallacy of *post hoc, propter hoc.* He points out that the tariff on steel has been raised since 1861, and that the article has been cheaper from 1861 to 1869 than it was from 1857 to 1861, and he associates these two facts in the relation of cause and effect. If he had taken the pains to enquire whether steel is not now cheaper the world over, he would have seen that his inference was a faulty one. Steel costing £52 in Sheffield in 1860 is now worth but £41; and Swedish iron, from which steel is made in Europe, has fallen from £15 to £10 per ton. So that "M.," instead of getting his raw material a little cheaper now than in 1861, would be paying far less for it if the duty had remained unchanged. The rate of duty prevailing from 1857 to 1861 was 15 per cent., while "M." admits that present rates are from 30 to 60. The prices of the chief varieties of steel in this market, at this time, and the duties upon them, are as follows:

	American—Currency.	Foreign—Gold.	Duties—Gold.
Cast spring steel	11c. per lb.	10c. per lb.	2¼c per lb.
Cast machinery steel	10@11c. per lb.	8@½10c. per lb.	2¼c. per lb.
Cast tool steel	15@17c. per lb.	13@½15c. per lb.	3c. per lb.

It will be seen at a glance that, when the prices of the foreign articles are reduced to currency at 110, their present cost will be about that of the domestic article. But suppose the duties were reduced to 15 per cent., as they were from 1857 to 1861, would not "M." be able to buy his steel cheaper now than in 1861? For it will be apparent to the reader that the duties above given are far in excess of 15 per cent. Or better still: Suppose the duties were abolished, as they should be, is it not clear that the cost of "M.'s" steel would be reduced by the whole amount of the duty, 2¼ to 3 cents, gold, per pound? To compare the prices of to-day with those of ten years ago, and draw the inference that "M." does, is absurd; for no allowance is made for improved processes of manufacture, or the numerous causes tending to affect prices that are sure to have occurred in so long a period of the history of modern manufactures as ten years. "M." says he is quite unconscious of contributing to the support of the Government as liberally as free-traders assert that he does, if he buys the foreign article, burdened with these enormous taxes. It is to enlighten just such men as "M." and consumers generally that the free-trade movement has been started. Moreover, it is proper to point out to "M." that, when he buys American steel, as he says he prefers to do, he pays tribute to some manufacturer, as the following figures will show:

	American in currency.	Foreign in bond in currency.	Excess paid manufacturer.
Cast spring steel	11c.	8¾c.	2¼c.
Cast machinery steel	10c.	6 92-100c.	2 8-100c.
Cast tool steel	15c.	12 15-100c.	2 85-100c.

"M." further says "that the tariff of 1861 raised the cost of steel and helped to establish its successful manufacture in this country." Now, I should like to ask "M." how a tariff which he admits *raised the cost* of steel could have been any advantage to him as a consumer of it; and I would also point out that, instead of any lessening of foreign competition as a result of the advancement of the rates of duty, there has been an increase of it. In 1860, our imports of steel were valued at the places of export at $2,724,355, and in 1869, notwithstanding the lower prices for foreign steel above indicated, thus causing any given sum to represent a greater quantity, the imports were $3,201,046.

It is high time that men like "M." should understand that, instead of being benefited by protection, they are being injured by it. Comparisons should not be made between the prices of to-day and those of ten years ago; but between those of to-day and those at which steel *could* be supplied if the duties were lowered or abolished. Protection can be likened to the giant in the nursery rhyme of "Jack the Giant Killer," who is represented as gobbling up men smaller than himself. This giant of ours has gobbled up our ship-building, our ships, and a large part of our export trade in our own manufactures, and when any one objects to his voracity, and proposes to limit his supply of food, the greedy old fellow sings, "Fee, fo, fum, I smell the blood of an Englishman," as in the nursery rhyme.

"Free-Trader."

THE RAWLINS STATUE.

To the Editor of the Nation:

Sir: I clip from the officially published laws of the last session of Congress the following, to which I call the attention of Representatives who believe in economy, and those who (if there be one) have any regard for public taste or the artistic civilization of the Capital:

> [Public Resolution—No. 80.]
>
> A Resolution directing the Secretary of War to place at the disposal of the President certain bronze ordnance to aid the erection of an equestrian statue of General John A. Rawlins.
>
> Whereas, it is in contemplation to erect a suitable bronze equestrian monument to perpetuate the memory of the distinguished deeds of valor and patriotism of the late honored Secretary of War, General John A. Rawlins, after the likeness of that taken in plaster from the face of the deceased; and whereas, a donation on the part of the Government of such bronze ordnance as may have been used or captured in the engagements in which the deceased participated, and which may be no longer useful, would greatly aid the erection of the same: Therefore,
>
> *Resolved by the Senate and House of Representatives of the United States of America in Congress assembled,* That the Secretary of War be, and is hereby, authorized and directed to place at the disposal of the President of the United States such bronze ordnance as may be no longer useful, to be by him contributed and applied to the furtherance and completion of the said monument in bronze; and that such number thereof as may be required in the execution of the same be given by him when the plaster model for the said statue shall have been completed: *Provided,* That the said monument, when completed, shall be erected upon such public grounds in the city of Washington as may hereafter be designated by the Joint Library Committee of Congress, and the title to the same be vested in the United States.
>
> Approved July 14, 1870.

I beg to call attention *en passant* to the elegant and graphic description of the forthcoming work of art, "a bronze equestrian monument" "after the likeness of that taken in plaster from the face of the deceased." I never saw Gen. Rawlins, and shall never cease to regret that so interesting a phenomenon as a face that carried the design of an equestrian monument in it should have escaped my eyes, though I must certainly admit that it is worthy of being reproduced for some museum of anatomy, not perhaps for a public ground, even in Washington.

To people of artistic instincts the fact, which I am able authoritatively to supply, that the strange and interesting work to be produced in accordance with the above law is to be by Clark Mills, will be sufficiently appalling. There are two "public grounds" in Washington already which Mr. Mills has made forbidden ground to men of taste by the nightmares yclept statues of Washington and Jackson—the most atrocious monstrosities ever put in bronze, with the exception, perhaps, of a few Hindoo idols. What Mr. Mills will produce, with the *lusus naturæ* with which we are sorry to hear that Gen. Rawlins was afflicted, before his eyes, I in vain try to conjecture.

But can any one tell us what is hidden in the convenient clause, "that such number thereof (bronze cannon) as may be required in the execution of the same be *given* by him when the plaster model for the said statue shall have been completed?" Who will judge of the number required? What limit can be set to the operation of a law so loose in its terms which shall assure us that Clark Mills shall not make an exhaustive requisition on the old bronze of the United States, and make not only a monument but a fortune *ære perennius?* Let us have light on this heavy theme.

Art.

Notes.

LITERARY.

Of works in the press of Messrs. J. B. Lippincott & Co., the most important is that for which we have already bespoken a liberal subscription—viz., Mr. Horace Howard Furness's "Variorum Edition of Shakespeare," beginning with *Romeo and Juliet.* It will be remembered that, besides the various readings of the numerous Shakespearian editors and their most valuable notes, this edition will present for the first time in English the critical commentaries of French and German scholars up to the present year. Other announcements are a "Life of John Adams," begun by John Quincy Adams, and completed by Charles Francis Adams; "Memoirs of the Life and Services of the Right Rev. Alonzo Potter. D.D., by Rev. M. A. De Wolfe Howe, D.D.; "Sergeant Atkins," a tale of adventure founded on fact, by an army officer; "Minnesota as a home for Invalids," by Dr. Brewer Mattocks; "The Science of Money;" the following religious works: "A Short and Plain Instruction for the Better Understanding of the Lord's Supper," by Rev. Dr. Thomas Wilson; "A Treasury of Christian Thought, Example, and Solicitude," third series; "Talks with a Philosopher on the Ways of God to Man;" "The Other Life," by Dr. Wm. H. Holcombe; and the following novels: "Lost and Saved, by Hon. Mrs. Norton; "St. Cecilia;" and a translation from the German by the accomplished and industrious Mrs. Wister; "Why did He not Die? or, The Child from the Ebreu-gang."——Mr. M. W. Sparks has devised for the convenience of those who receive calls on New Year's an Autograph Album, consisting of any number of pages with outlines in imitation of cards in a basket, for the caller's signature in his own hand. The idea will commend itself to many as an easy method of making up and keeping these conventional "lists."

—The Hartt expedition to Brazil is nearly at an end. Some of the party have already returned to their homes, some have gone south to Bahia and Pernambuco, and the remainder, including Professor Hartt himself, return this month to the North. The collections made have been ample, and the observations of the geological structure of the Amazon Valley quite important. Professor Hartt is confirmed in his previous opinion that this formation is not drift but Tertiary, contrary to Professor Agassiz's determination of it. We shall soon have the reasons for such a conclusion. Professor Hartt has found time, he writes, to study the Tupi language, so as to be able to converse in it; and he has amassed a copious vocabulary and a chrestomathia of two hundred pages, all written phonetically. In collecting and publishing these, he will have rendered signal service to philology.

—In the last *North American Review*, as well as in the *Nation*, which contained a notice of the *Review*, and in most other journals which had notices of it, an article on "The Second Empire" was said to have been written by Mr. H. W. Homans. This, as we remarked at the time, was a new name in American periodical literature. As it is a name appended to a very good article, and as it is not the name of the author in question, but was put for his by a proof-reader's error, we take this opportunity to assist in making the necessary correction. The writer's name is H. W. Hemans; and we may be permitted to add that he is a son of the poetess.

—The *Review*, by the way, makes good promise for the new year, and it would seem that its friends and the friends of good literature need not be ashamed to urge its claims upon persons likely to subscribe for it. Indeed, if the practice of giving presents at this time of the year is to be kept up—though it almost seems as if it were time for sensible people to begin to protest—we do not know that one could do better than not only to urge the claims of the *North American* upon acquaintances, but also to select some thoughtful reader of good reading, some citizen careful about the enlightened performance of his political duties, some student of social science, and, making a subscription in his name, send him four times yearly, as a remembrance of one's good-will, a bookful of sound sense, wit, and learning, applied to things new and old. The January number, for instance, will have a long paper by the ex-Secretary of the Interior, the Hon. J. D. Cox, who will treat of "Political Reform;" another of Mr. Lowell's critical essays, which will consider the character and works of the poet Pope; an essay on Prussia, by Mr. Hemans, which will match the essay on Napoleonic France contributed by the same gentleman to the October number; a long article on Government Control of Railroads, by Mr. C. F. Adams, jun.; some criticisms of books worth criticising, by Professors W. D. Whitney, James Hadley, and other men worth respectful attention; and various other articles on various subjects. Among these we may mention a review of public events occurring during the last quarter, which will be mainly or wholly done by Professor Henry Adams, and over which it is probable that not many persons in Washington or elsewhere will fall asleep, and an article on art matters which will have as its writers two very competent authorities—artists and writers of sufficient knowledge and sufficient practice of art in several of its forms, and of sufficiently decided views, to make it certain that they will say definitely what they wish to say, and that what they think fitting to be said will be at least worth listening to. It is likely that in the future this latter department—as well as the record and review of public events—may be made larger and fuller than at first. And, further, it is not wholly unlikely that the ancient quarterly may, by-and-by, undergo a partial transformation, and become a bi-monthly journal—a change which would appear to be for some reasons desirable, as, for instance, because it would bring the review somewhat closer to the political and literary life of the country, and tend, it is probable, to make it more directly and effectively operative on political and literary activity. In this time and country of newspaper writing and reading, a nail driven must be speedily clinched, or another from the other side may displace it. In the prospectus before us, Messrs. Fields & Osgood, with allowable pride, call attention to a long line of distinguished contributors, with which, adding a few not down in the publishers' list, we may close our notice: Daniel Webster, Rufus Choate, Bryant, Judge Story, Chief-Justice Shaw, the two Everetts, Judge B. R. Curtis, Robert Rantoul, President John Adams, Mr. Wheaton, Caleb Cushing, R. H. Dana, J. L. Motley, W. H. Prescott, Ticknor, the historian of Spanish literature, Irving, Theophilus Parsons, George Bancroft, Emerson, Longfellow, Lowell, President Sparks, of Harvard, Charles Sumner; Francis Parkman, J. G. Palfrey, F. J. Child, C. E. Norton, E. W. Gurney, W. D. Howells, Jeffries Wyman, Arthur Clough, Goldwin Smith, F. B. Sanborn, W. F. Allen, A. P. Peabody, Francis Bowen, Chauncey Wright, C. C. Perkins, Eliot Cabot, and very many others who, in the time since the *Review* was established, fifty-five years ago, at the end of "the late war with Great Britain," as we used to say, have kept it at the head of American literature—which, indeed, it has not only done so much to elevate, but which it has itself in large part been.

—In reading the terse and sensible report of the Secretary of War, one is reminded of highly important functions of our military organization which are commonly overlooked in the popular view of that department of the Government. Such are the Engineers' survey of rivers and harbors, the dredging and other improvement of these, the location of bridges, piers, and breakwaters; the survey of the Great Lakes—a most useful enterprise; geological surveys along the Pacific Railway; the storm-signal service, etc., etc. No office, however, that reports to the Secretary of War has attracted more attention abroad or reflected greater credit on the Government and on the scientific discipline of the country than has the Surgeon-General's. We offered lately some testimony as to the acknowledged superiority of American surgery to that of the Continent; and whoever desires more of the same kind will find it in the "Memorandum referring to Extracts from Letters, Reviews, and Bibliographical Notices of the Publications of the Surgeon-General's Office" (Washington, 1870). These publications were begun about five years ago, and consist thus far of five "Circulars"—quarto volumes each, of from 65 to 166 pp.—and a "Catalogue of the United States Army Medical Museum." The Circulars are so many reports: on the extent and nature of the materials available for the preparation of the Medical and Surgical History of the Rebellion; on epidemic cholera in the U. S. army in 1866; on amputations at the hip-joint in military surgery; on epidemic cholera and yellow fever in the U. S. army in 1867; and on excisions of the head of the femur for gunshot injury. The illustrations of these documents have been remarkable for the employment of photo-micography, in regard to which three special reports have been made to the Surgeon-General by the officer in charge of the Microscopic Section, each containing samples of this truly wonderful process. American invention, if not the first to make use of it, has, as usual, facilitated the application of it by appropriate original mechanism.

—Some of Surgeon-General Barnes's statistics deserve reproduction. For the year ending June 30, 1870, the medical records of the army show that "while the rate of mortality from wounds and injuries among the colored troops agrees with that among the white troops, their rate of mortality from disease alone is nearly double." The Record and Pension Division is charged with the duty of supplying information concerning "cause of death," and "treatment" and "cause of discharge for disability;" and some idea of the extent of its labors may be got from the fact that enquiries from the Pension Bureau were answered in 16,514 cases, from the Adjutant-General in 5,124, and from other sources in 890 cases. These more than fully occupied the Hospital Stewards to whom they were committed, and the force ought to be increased. They are obliged to consult no less than 15,854 Record Books, an Alphabetical Register of Deaths embracing 289,928 names, and another of Discharges on Surgeon's Certificate of Disability amounting to 188,031. The Medical and Surgical History of the War, authorized by Congress in 1869, is in active preparation, 1,300 quarto pages of the first part being actually in print, and the materials for the second part being ready in the manuscript. With the surgical portion belong tabular statements, discussions, and histories of typical cases, illustrated by wood-cuts and lithographs, of 29,572 cases of amputations, and 4,775 of excisions; together with the consolidated surgical statistics of the army for the five years succeeding the war. A law of Congress authorizing the issue of artificial limbs to mutilated soldiers and seamen has indirectly promoted the interests of science, by "bringing to Washington a large number of pensioners to present their claims," thus permitting "the study of the remote effects of injuries and mutilations"—the value of which, as the Surgeon-General remarks, cannot be overestimated. "The abstracts of cases in this Office," he adds, "are invariably traced to the date of publication." The Army Medical Museum ranks with any other in the world, and surpasses all in some of its collections. It contains the enormous number of 897 human crania and 34 skeletons, being especially rich in skulls from tumuli and crania of North American Indians; all have been accurately measured in their principal dimensions, and the data tabulated for publication, which Congress, it is to be hoped, will allow, without delay, along with the remainder of the Medical and Surgical History. One consideration alone should suffice to make our legislators foster a bureau whose achievements have already been so brilliant and honorable, in spite of the slender support which it has received: "In the standard German systematic work on surgery," says the Report, "by Billroth and Von Pitha, in the last edition of the English System of Surgery by Holmes, in Didiot's 'Service de Santé des Armées,' and in nearly all works on military medicine and surgery printed in the last five years, the majority of the wood-cuts are derived from the specimens in the U. S. Army Medical Museum."

—Medical topics abound this week. There lie before us two pamphlets by Dr. Frank H. Hamilton, on the "Advance in Medical Teaching in this Country during the last Century;" and by Dr. Edward S. Dunster, on the "Relations of the Medical Profession to Modern Education," which forms also the leading article of the *N. Y. Medical Journal* for December. Prof. Hamilton's lecture is an agreeable review of the various stages of medical instruction from the time when, in 1750, apparently in New York, a dissection was made of "the first human subject ever dissected in North America with a view to teaching," to the present day. The body in question was that of an executed convict, whereas now it is almost a condition of entering any public institution as a patient that the cadaver shall be at the disposal of the surgeons. A hundred years ago the Medical Department of the University of Pennsylvania was conducted by five professors, while fourteen, with distinct branches of instruction, are now engaged at the Belleville Hospital College in this city, and the number is certainly destined to increase. One result of this subdivision has been to improve the examinations, for the obvious reason that, as "each examiner is more exacting in his own department than he is in the department of his colleagues, where his own attainments are usually less," the more examiners (professors) there are, the greater the knowledge required to satisfy them. Prof. Hamilton is able to say positively that "the preliminary education of candidates is vastly in advance of thirty years ago," and he is of opinion that before long, "whether medical colleges see fit to impose these restrictions or not, few or none will enter upon the study of medicine in this country who have not attained the degree of Bachelor of Arts, or who have not made such general scientific and classical attainments as this degree usually represents."

—Dr. Dunster's address ends in the same spirit, demanding "a high scientific education before admitting the student to the study of medicine proper," as well as a "lengthening of the time of that study, and taking up the separate branches in their natural and progressive order." The first half, which goes to show the claims which scientific education is making for itself in our systems and institutions of learning, might, we think, have been stated in fewer words, as being by this time tolerably obvious, not to say notorious. The second discusses a very interesting question as to the comparative fitness of the three learned professions to take a leading part in this modern education according to the spirit of the age. It is unfortunate that medicine should have come to be so identified with therapeutics as to subject all general statements in regard to it to scrutiny from the stand-point of the pill-box, sooner than from that broader plane in which "medicine, as one of the great divisions of human culture, must be considered as taking in the whole of physical science." At least we have felt this difficulty in following Dr. Dunster's argument; and we have asked ourselves, as a preliminary question, whether there is any longer a reason for classifying doctors with clergymen and lawyers that is not to be found in the *terminology* of the healing art. Knowledge of Latin and Greek was the common badge of the *learned* professions; and Dr. Dunster virtually takes the physician out of the category when he insists only on a high "scientific" education for the student of medicine, and not, as Prof. Hamilton, upon the classical also. That done, there can be no dispute as to whether law, medicine, or divinity stands nearest to the present tendency in education. But it ought to be kept in mind that leadership belongs not to that part of medicine whose jargon was naturally associated with the jargon of the law and of dogmatic theology, and which seems destined to an endless empiricism, but to that other part which is concerned with the knife and saw, the microscope, the test-tube, the galvanic battery, and other scientific appliances, the progress of which is certainly not advancing *pari passu* the sphere and administration of drugs.

—Two or three times in recent years, certain citizens of Medford, in Massachusetts, have endeavored to persuade their fellow-townsmen to purchase and hold as common property what is asserted to be now the oldest building in this country. It is known as the Cradock House, or the Old Cradock House, and stands in Ship Street in East Medford—a pretty little village in the environs of Boston, and largely inhabited by persons engaged in business in that city. Mr. Matthew Cradock was a London merchant some two hundred and fifty years ago, and, being a Puritan and wealthy, he became deeply interested in the founding of the colony at Massachusetts Bay, was able to do much in promotion of the prosperity of the settlers, and in the year 1628 was appointed Governor of the Company of Massachusetts Bay. We believe it may be taken as a historical fact that Mr. Cradock never came to this country, and that he never actually ruled the people here. Nevertheless, he is perhaps better deserving of remembrance by Americans than most of the men who have exercised more authority among us and are of more fame. It was he who first proposed that the government of the new colony should be lodged in the hands of the colonists; should be self-government, and not direction from London—a pregnant proposal, as was seen a century and a half later, and one the credit of which should, so far as we know, be given to Mr. Cradock alone; though, of course, it is in this case, as it seems to be in all cases when we look at history century by century, very difficult to give especial credit to one man or especial importance to one event—as difficult as it is, when we look at history year by year and day by day, to find "God in history," and to refrain from laying infinite stress on the operation of the particular acts of particular persons. Whether Cradock was or was not ever in America, he had at any rate an agent here who managed in his interest a small "fishing plantation" on the banks of the Mystic River near Malden, Mass.; and in 1634 the General Court made him a grant of a large tract of land in Medford, not far from his agent's place of residence, and upon this grant, in the course of the same year, he had a house erected. It still stands, and is to-day but very little altered from what it was when first built. It is of brick, with walls a foot and a half in thickness, pierced for loopholes as well as for windows, and thus, it would seem, designed to serve the purpose of a fort as well as of a dwelling-place; the windows, too, were formerly iron-shuttered, the door had an iron covering, and there were fire-proof closets, probably for the storage of ammunition. These last still exist, we are informed. The building is two stories in height, with a gambrel roof, and the inside is finished with white oak, which remains in good preservation, and gives testimony, with its massiveness and solidity and soundness, to the thoroughness with which the old-time contractors and carpenters did their work. It is a pity that so interesting a structure, one so well fitted by its history and its material strength to bear record for generations of the early history of the country, should be in any danger of disappearance. It might be used with excellent effect as a storehouse and museum for relics of our ante-Revolutionary days, and the town of Medford might earn honor by purchasing it and applying it to some such use. Filling its rooms with old furniture, making it the repository of old historical documents, and an occasional meeting-place for antiquarian students and their friends—the social element not being neglected—it might soon be one of the most profitable—we do not mean pecuniarily profitable, though that, too, it might be—pleasant, and interesting "show places" in the whole country. The wonder is that the Massachusetts Historical Society, or some similar body, has not long since made prize of such a piece of perfection in the way of a club-house as the Cradock House seems to be, or might so easily be made. Hardly further from Boston than the Central Park from the Astor House, joined by good roads and good railroads to a city full of descendants of the Puritans, one would have supposed that for the last twenty years not an Englishman could have landed at East Boston without being immediately put into a hack by a committee of writers for the *Genealogist* and carried out to a little dinner at Medford. As it is, however, there is no more knowing what day it may not be pulled down than what day saw the building of Fort Popham—a fortalice which annually occasions much bloodshed among members of the Historical Society.

—The animosities of the Franco-Prussian war doubtless are felt in every part of the globe where Frenchmen and Germans, travelling or settled, encounter each other. This may very well be the case in Palestine, whose coast is traversed by subsidized French steamers, and along the highway, from Beyrout to Damascus, the monopoly of a French company. A religious sect calling itself the "Temple," which has found most of its adherents in Würtemberg, is establishing colonies at four points in Palestine, viz., Jaffa, Jerusalem, Haifa, and Beirut. Mr. Kiepert, writing from the first-named place in the latter part of May to the Berlin Geographical Society (see the *Zeitschrift*, No. 28), estimates the colonists at nearly 200 all told, those at Haifa being most numerous. The majority are mechanics, and in Jerusalem especially are a great comfort to foreigners whose outfit stands in need of repairs; elsewhere they cultivate the soil for a great variety of semi-tropical products, and raise some cattle. Haifa was first settled in September, 1869, and has a church and school-house, with a liberal course of instruction; but Jaffa is very promising. Here, it is hardly forgotten, Elder Adams and his Maine disciples attempted to found a settlement which, in 1867, seemed in a fair way to prosper, notwithstanding past dissensions and some deaths; but their funds gave out at last, and their well-built two and three-story houses (constructed in Maine and brought over in pieces) are now occupied by the German sectarians, who are much shrewder in money matters, and place their funds in a common treasury. The mistakes and failure of the Americans, and of a previous German colony at Samunieh, near Nazareth, have profited the followers of the "Temple" both pecuniarily and in the choice of wholesome localities.

PROFESSOR HUXLEY.*

In this little volume are reviews by a merciless critic, essays by a most effective teacher, and "lay sermons" by a preacher who at least believes to the full the doctrines which he promulgates. All of these papers have appeared in England, and several of them are familiar to American readers; their collection and republication is warranted in part by the general interest in protoplasm, the origin of species, and education, and in part by a wish to ascertain upon what grounds their author has of late years received some very hard names.

Prof. Huxley is under fifty years of age, and in the fullest possession of mental and physical powers which have carried him by rapid strides, and within two decades, to the front rank of British men of science. Twice President of the Geological Society, for many years Professor of Natural History in the Royal School of Mines, and of Comparative Anatomy in the Royal College of Surgeons, and this year (1870) presiding at the Liverpool meeting of the British Association for the Advancement of Science, he has had ample opportunity for the official promulgation of his views; he is, moreover, one of the few English savants who are ready to address mixed audiences; and he has on several occasions given familiar discourses on scientific subjects before workingmen. He has a wonderful power of illustrating difficult matters by means of everyday objects and occurrences, and his comparisons, especially when aimed at opposing theories, are so apt as to make us wish the present volume had an index, if only as a guide to such intellectual tidbits. His style is very clear and compact, both his words and his sentences being remarkable for brevity, and as a lecturer he is surpassed in impressiveness only perhaps by Agassiz, whom, however, he does not at all resemble.

The first six papers, occupying one-third of the present volume, treat of the aims, the subjects, and the methods of education. Prof. Huxley claims the privileges of education for all races and for both sexes; but he is not yet convinced that the blacks are the intellectual equals of the whites; neither is he sure that women are by nature destined to cope with men in all their pursuits, fearing that "as long as potential motherhood is woman's lot, she will be fearfully weighted in the race for life;" but he insists that in both cases "injustice be not added to inequality" by slavery, or by the denial to women of any opportunities for education. In his view, education has two great purposes, physical and moral. First, to increase knowledge for its practical benefits. Second, to develop the love of right and the hatred of wrong (p. 69). Life is a game of chess which every man must play, yet for which we were ill prepared ourselves; and for which we fail to prepare our children by teaching them the pieces, the moves, and the consequences of defeat (p. 31). He refers to the great fire and the plague of two centuries ago as matters of neither chance nor arbitrary Providence, but as inevitable results of ignorance; and he regards the lack of natural knowledge as the cause of all crime and suffering (pp. 2 and 39).

"To read, to write, and to cipher are simply *tools;* the means by which real wisdom is to be gained, by which the youth is to learn the fundamental laws which govern the course of things, so that he may not be turned out into the world naked, defenceless, and a prey to the events he might control;" for "ignorance is visited as sharply as wilful disobedience—incapacity meets with the same punishment as crime. Nature's discipline is not even a word and a blow, and the blow first; but the blow without the word. It is left to you to find out why your ears are boxed. A liberal education is one which has not only prepared a man to escape the great evils of disobedience to natural laws, but has trained him to appreciate and seize upon the rewards which nature scatters with as free a hand as her penalties" (p. 34). The "stones of education" which, at a cost of ten thousand pounds of money and a dozen of his best years, the British father offers to his son for intellectual food, are too well described as almost exactly "equivalent to what the son of a well-to-do Roman citizen would have received fifteen hundred years ago" (p. 117). And what is the result? The youth has a general impression that "everything of importance happened a very long while ago." "He has found Parnassus so steep that if he ever gets to the top, he recalls his journey with terror. He has read fables more or less absurd, and not always decent, which leave an impression upon his mind that those who wrote them were idiots. He has no ideas of the colony in which he may settle; no notion of the laws of commerce; no knowledge of the processes of manufacture; no conception of political economy, excepting as regards the ancients; no source of truth but authority; and, finally, no science, excepting as a slang synonym for the manly art of self-defence."

But while speaking thus strongly of an exclusively classical training, Prof. Huxley simply means that, to make it the backbone of modern education, is as unnatural as to require every youth to master the science of paleontology or homology; in which, by the way, he engages to get up an "osteological primer so pedantic in its terminology and so distasteful to the youthful mind as to beat the recent famous production of the head-masters out of the field" (p. 44). According to Herbert Spencer, the question of true education is no more involved in the relative merits of mathematics and the classics, than the whole question of dietetics hangs upon a decision whether bread is more nutritive than potatoes; and Huxley objects to the former as based essentially upon books and authority, and as being already so perfect as to leave the student little opportunity for extending their domain by original research. He further compares mathematical science to a "mill of exquisite workmanship, which grinds you stuff of any degree of fineness; but, nevertheless, what you get out depends upon what you put in; and as the grandest mill in the world will not extract wheat-flour from peascods, so pages of formulæ will not get a definite result out of loose data" (p. 249).

And so, while fully admitting the importance of mathematical studies for those who will make some practical use of them, for all others the work done in them with a vague idea of mental discipline is as useless and exhausting as was that of the man who ran a mile in order to prepare himself for leaping a mountain. But Prof. Huxley energetically protests against the common division of science into exact and inexact; and, allowing for their greater scope, he insists that natural history sciences are pursued upon the very same methods which are employed in physics or the higher mathematics. These methods involve four logical processes: 1. Observation and experiment. 2. Comparison and classification. 3. Deduction. 4. Verification (p. 83). And they have the further and great advantage of being acceptable to the young, and dealing with the objects of the senses.

It will be remarked that Prof. Huxley gives only two purposes of education, of which one is purely material, the other purely moral; and he wholly omits what most persons, who believe in a soul in the human form, in a future life, in a personal God, would regard as a third and still higher object of education—to gain some idea of our own spiritual constitution, and the character and purposes of the Creator in whose image we are made. This omission is rendered significant by passages like the following: "There is but one kind of knowledge, and but one method of acquiring it" (p. 19); "natural knowledge can alone satisfy spiritual cravings" (p. 11); "religion has risen, like other kinds of knowledge, out of the interaction of man's mind with that which is not man's mind" (p. 16); "the only medicine for suffering, crime, and all the other woes of mankind, is wisdom" (p. 39). And further, in respect to science, he says: "Science and philosophy are neither christian nor unchristian, but extra-christian" (p. 341); "we can have no knowledge of the nature of either matter or spirit" (p. 144); "fact I know and law I know; and matter and law have devoured spirit and spontaneity" (p. 142); "it is a philosophical impossibility to demonstrate that any given phenomenon is not the effect of a material cause" (p. 142); "the final object of physiology is to deduce facts from the laws of the molecular forces of nature" (p. 121); "whether a law is to be regarded as the expression of the mode of operations of natural forces, or whether it is simply the statement of the manner in which a supernatural power has thought fit to act, is a question of secondary importance" (p. 214); "many problems about which we are naturally curious, are essentially questions of lunar politics; of which we know nothing, and can know nothing" (p. 145); "scepticism is the highest of duties, and blind faith the one unpardonable sin;" "as a man of science he believes in justification, not by faith, but by verification" (p. 18).

---

* "Lay Sermons, Essays, and Reviews. By Thomas Henry Huxley, LL.D., F.R.S." New York: D. Appleton & Co. 1871. pp. 378.

Now, for these words, and more which might be cited, Professor Huxley is held up as a gross materialist, who has no idea of a future life; as a deist; as even an atheist; and certainly as a violent and audacious sceptic, who scouts all authority, applies very hard names to the clergy, and who is in all probability a dangerous man in every respect. It is certain that he is a Darwinian; he talks coolly of spontaneous generation; he cleaves to geology, and despises revelation. These are heavy accusations, and they seem to be justified. How far can they be met? In regard to the last counts, it may be at once stated that if (as is done on page 277) to discredit the literal Mosaic record of the formation of the earth is a sin, Prof. Huxley is in excellent company; and for those who are not with him in this respect, our space will not permit us to discuss the point. The same may be said of him as a believer in the theory of natural selection, which he has adopted provisionally, just as he adopts the undulatory theory of light ("Man's Place in Nature," p. 128); and whether the particular hypothesis of Darwin or some other derivative theory be the true one, the Scripture nowhere describes in detail the precise methods by which living forms were produced, and it is as allowable to suppose that higher were created in some way by means of lower, as it is to suppose that they all sprang "limbed and full-grown" from the earth. But in either case, the first and lowest organisms would have appeared to an observer to arise spontaneously, and the investigations which are so clearly described in the last and best paper of this work, are solely for the purpose of learning whether such a thing as "abiogenesis" occurs at the present day. Prof. Huxley does not think it safe to draw conclusions yet; he inclines to think the present evidence is against it; but in reference to the original occurrence he says, "I should then expect to be a witness of the evolution of living protoplasm from not living matter; but this expectation is simply an act of philosophical faith."

Is Huxley a sceptic? Yes; for what he considers good and sufficient reasons, given especially in that last but one of the essays, in which he speaks of Descartes; he believes in the rule, "Give unqualified assent to no propositions but those the truth of which is so clear and distinct that they cannot be doubted" (p. 322). But his is "an active scepticism, whose whole aim is to conquer itself, and not that other sort born of flippancy and ignorance, and whose aim is to perpetuate itself as an excuse for idleness and indifference; my whole intention is to dig away the drift and the sand until I reach the rock beneath" (p. 323). This is the quality of mind which has made Professor Huxley one of the clearest thinkers and safest scientific guides of his time. We may not adopt his conclusions, but we are generally safe in accepting his premises.

But the trouble with Huxley is not in respect to his science but his theology. We must now ascertain to what extent the ugly terms "atheist" and "deist" and "materialist" can be applied to him. Let us quote his own words: "I am no materialist, but, on the contrary, believe materialism to involve grave philosophical error" (p. 139); "the errors of systematic materialism may paralyze the energies and destroy the beauty of a life" (p. 146); "I hold with the materialists that the human body is a machine, all the operations of which will, sooner or later, be explained on physical principles; that we shall arrive at a mechanical equivalent of consciousness and volition; but, when the materialists stray beyond their path, and begin to talk about there being nothing else in the universe but 'matter' and 'force' and 'necessary laws,' I decline to follow them. What we call the material world is only known to us under the forms of the ideal world; all our knowledge is a knowledge of states of consciousness. If I say that 'impenetrability' is a property of matter, I mean that the consciousness I call extension and the consciousness I call resistance constantly accompany each other. And if I say that thought is a property of matter, all I can mean is, that, actually or possibly, the consciousness of extension and the consciousness of resistance accompany all other sorts of consciousness. Why and how they are thus related is an insoluble mystery" (pp. 339, 340, 341).

Let us, then, see what Professor Huxley says of a Creator. The word God or mention of His attributes occurs frequently in this volume, but, in the majority of cases, in such connection as to indicate nothing respecting the writer's individual belief. But the following passages must be carefully weighed before their author can properly be judged an atheist in the common sense of the term: "I take it that all will admit there is a definite government of this universe—that its pleasures and pains are not scattered at random, but are distributed in accordance with orderly and fixed laws" (p. 90). "The chess-board is the world, the pieces are the phenomena of the universe; the rules of the game are what we call the laws of nature. The player on the one side is hidden from us. We know that his play is always fair, just, and patient; substitute for the mocking fiend in Retzsch's picture a calm, strong angel who is playing for love, as we say, and would rather lose than win, and I should accept it as an image of human life" (p. 32). "The religion of the present day sees the need of cherishing the noblest and most human of man's emotions by worship, for the most part of the silent sort, at the altar of the Unknown and Unknowable" (p. 16). "Matter and Force are the two names of the one artist who fashions the living as well as the lifeless" (p. 262). "The universe is the veil which lies between us and the Infinite" (p. 283). In "Man's Place in Nature," he speaks of man as "one in substance and in structure with the brutes, but as raised far above his fellows, and transfigured from his grosser nature by reflecting, here and there, a ray from the infinite source of truth." And, finally, as an express reply to a charge of atheism, Prof. Huxley says: "I hold that atheism is as absurd, logically speaking, as polytheism" (*Spectator*, Feb. 10, 1866; quoted by Argyll, "Reign of Law," p. 89).

Huxley seems not to care about propitiating his theological critics, the "righteous overmuch, who disagree in all else than their ignorance of nature," amongst whom he wishes there were "one like Butler of the 'Analogy,' who, if he were alive, would make short work of most of the current *à priori* infidelity of the day" (p. 62), and thus lays himself open to attack. But if they will read his works as carefully, they will see that he nowhere *denies* the existence of a divine being; at the worst, he sees no direct evidence of his existence, and intimates that we all have enough to do in this world to relieve misery and abate ignorance. That there is a future state, in which the essence of man shall dwell in a human form, he surely seems to believe, from passages upon pages 162, 164, and 166. But Professor Huxley is far too logical not to perceive, even if he does not directly mention, the wide gaps which a positive atheism would leave in his own philosophy. What is the *origin* of the difference between his living and his not living protoplasm? (p. 137). What are the "subtle influences" to which dead protoplasm, in the form of food, is subjected in his "curious inward laboratory?" (p. 133). Whence is that "volition which counts for something as a condition of the course of events" (p.145), and that "power of self-adjustment" which we possess? (p. 340). What is the conscience to which he evidently refers (upon p. 69) as "love of right and hatred of wrong, and which education is only to *develop*, not *produce?*" Whence are love and all human affections? Surely he cannot mean that all these are simply the *result* of molecular changes, even though, like thought and muscular contraction, they may be concomitant therewith. If he does mean all this, he could and should state it in clearer language than he has hitherto done.

Professor Huxley is then a "deist," because he cannot make the facts of science agree with the literal sense of Scripture, and has not learned that there is an internal spiritual sense with which all science is in strict accord. He is not an "atheist," if we may take his own express statement, and the opinion of a zealous churchman, the Duke of Argyll. Whether or not he is a "materialist" depends upon the signification of that very indefinite term and the interpretation of his own language.

But were he all three of these, and were his scientific teachings false in the main, instead of true, and were he more hated than loved by those who know him best, even then his keen sense of right and wrong, as evinced in "Emancipation, Black and White," and his scorn of the cruel sophisms used by the advocates of Gov. Eyre, whom he publicly denounced, would make us hesitate long before expressing a doubt as to the good influence of his writings. Whatever his faith may be—and of faith it may well be said, "A little that a righteous man hath is better than the riches of many wicked"—he at least means to live according to it. "The only freedom I care about is the freedom to do right; the freedom to do wrong I am ready to part with on the cheapest terms to any one who will close with me (p. 340): my ideal is one whose passions are trained to come to heel by a vigorous will, the servant of a tender conscience; who has learned to love all beauty, whether of nature or of art, to hate all vileness, and to respect others as himself" (p. 35).

Surely religion need fear nothing from one who honestly utters such sentiments; least of all can his "materialism," whether real or apparent, injure those who accept the following statement concerning the relation of the Creator and the universe:

> "Everything in nature owes its origin and cause to something in the spiritual world. The influx of the Lord is use, which is prior to the organical forms intended to effect use. All the conatus or endeavor of nature is from the perpetual influx of the Lord; thus from influx is derived conatus, from conatus energy or force, and from energy effect; and if the influx of the cause should cease for a moment the effect would instantly perish. Doubts concerning the influx of all life from one fountain cannot be removed while men are persuaded by the fallacies of the senses. Man can learn nothing of the divine from nature, but only from revelation."

This last would indicate that there is really no such thing as natural theology in the strictest sense; but rather that with those who were early taught to acknowledge a God, nature may furnish confirmation and illustration.

This is most emphatically the case with Prof. Agassiz, for whom the "facts of nature proclaim aloud the One God, whom man may know, adore, and love." Let us hope that, with all his reluctance to believe more than he can see, Prof. Huxley is on the path to the same conviction. We know that with every step in that direction the clear gray of science becomes a golden light, in which the interior laws which govern matter appear more and more plainly in their true connection, as material expressions of divine order.

GIFT BOOKS OF THE SEASON.*

WITH each new batch of our illustrated books, fresh point is given to Heine's saying, that what is called book illustration offers a reward to the artist who can cherish commonplace, and repeat himself with assiduity. The individual artist, in his one picture, can risk something for a new idea, and its chance of taking with the public; but the collective publisher has, upon the whole, decided that such a course is not for his own profit as long as the old ways are not yet outworn. Under this pressure, the hack illustrator outranks the artist, who is encouraged to give poor work that he may keep an average; and the respectability of this average depends upon the general level of art in the country. Occasionally an exception comes up in the case of some draughtsman, who, having done his duty by the publisher, can also do something for himself and the public. In the illustrations of Mr. Bryant's "Song of the Sower," Mr. Harry's Fenn's work is the principal point to be noted. Experienced in his practice, he has not only quite recalled Birket Foster's spotting of the page with brilliant and intelligent landscapes, but in one of his drawings he has attained a pleasant simplicity. This is all the more to be mentioned in his favor, that few of the men who draw upon wood have done worse work, meaning work of no value as art, than this same Mr. Fenn, unless, perchance, we have been unable to distinguish him from some others. On the contrary, Messrs. Griswold, Hennessy, and Homer do not appear to advantage; Mr. Homer's manliness is never entirely obscured, but Mr. Griswold seems to have been cramped by instructions, and Mr. Hennessy hesitates between Blake and those illustrators of "The British Ballads," to imitate whom was probably an ambition of his childhood.

The figure illustrations of the poems of George Herbert belong to this latter Anglo-German school, which still lingers. A certain Low Church taste distinguishes them in absurd mistranslation of the chivalric tone of the poet's devotion. Even the floral decorations seem to partake of a mistrust of beauty and of nature, as savoring of paganism or of papistry. The merit of the book does not call for any serious remark, but in a similar case it might not be useless to classify, before its extinction by more elegant types, that mock Elizabethan which has done duty in so many artistic needs of modern Protestantism. Not a bad example, however small, is a little drawing by Mr. Hows, illustrative of the Lord's Table in the "Song of the Sower."

The other English book—Milton's "Ode on Christ's Nativity"—which has a sad jumble of very weak illustrations, may be mentioned as a good subject for serious pictorial decoration. Not that we do not prefer to hold that a great poem is at its best in its natural dress of print, but there is such a thing in decoration as not to disturb the peace of the page.

This ideal of unobtrusive accompaniment was prettily attained in Paul Konewka's silhouette illustrations to the *Midsummer-Night's Dream*. They were meant to be printed in the text in the manner of initial letters, and in their black surface harmonized pleasantly with the face of the type. This year, in the Boston edition of his illustrations to Goethe's *Faust*, the text is disagreeably separated from the drawings, which are thus made too important for their nature and intention. Too much attention is thereby drawn to the frequent success in cutting out black-paper silhouettes achieved by persons of most limited artistic faculty; and this casts slur upon any such accomplishment. We notice, by the way, that the beauty of the cuttings for the *Midsummer-Night's Dream* was in part owing to their representing profile views of the nude body, while in *Faust* the covering of costume imposes disagreeable lines more annoying than they can ever be in nature. With a general poverty of design and intention in this set of drawings, there is much accurate grace of movement, as in the first figure of Faust, for instance. Through a barbarous American habit, ridiculous initial letters of the cheapest manufacture are used in the printed page, which has some pretension to elegance. As much may be said of the binding, which is of the type of pictorial book covers. The pretty floral ornamentation of the *Midsummer-Night's Dream* was in much better taste.

No peculiar excellence was ever aimed at in illustration of "Songs of Home" or "Winter Poems." The latter drawings are all new, a good many of the former old; none are above mediocrity, unless we should single out Mr. Fenn again. As to Mr. Hennessy and Mr. Homer Martin, they have done their better work this year in *Every Saturday*.

HOLIDAY BOOKS FOR THE YOUNG.—IV.*

IN "Little Red Riding-Hood," "Blue-Beard," and "Hop-o'-my-Thumb," Doré had a fine opportunity for displaying his fondness for the horrible; but he has used it with comparative moderation; or perhaps the publisher of "Popular Fairy Tales" has selected with some humanity from among the plates he had to borrow from. We should naturally have expected the spectacle of Bluebeard's murdered wives, but that is spared the infant reader, who, however, is treated to the wolf's assault on the grandmother, and to the ogre's seizure of Hop-o'-my-Thumb's brothers, knife in hand. These pictures are, like the book itself, of quarto size; but smaller ones by another designer illustrate the more innocent tale of Cinderella.

The "Book of Nonsense" has a perennial freshness, and will lose little in young eyes from the fact that Mr. Miller's edition is cheap and cheaply colored. Here and there parents may find a verse that will fit into the discipline of the nursery, while cultivating the sense of humor in the delinquent; as,

"There was an old man of the Nile
Who sharpened his nails with a file;
Till he cut off his thumbs,
And said calmly, 'This comes
Of sharpening one's nails with a file.'"

The translations of "Black Peter" are not remarkable except for stiffness and dulness, but Konewka's silhouettes are here at their best. They are graphic of childhood and animal life, and will, we apprehend, impress the memory much as their blackness impresses the retina. Mr. Brooks's verses are, of course, unexceptionable, but will probably not be repeated more than once by the mother who is called upon to explain Puck's pranks. These, though more ornately and gracefully rendered than those of "Black Peter," are of less interesting description, and have not the advantage of being within the experience of children.

"Clever Jack" shares, in common with most books of its kind, the fault of making its supposed author—in this case, a donkey—entirely too human, and so leaving in the mind of even the most willingly credulous reader no shadow of illusion. It is not a bad story in its way, however, and children will read and listen to it with interest, although its drollery, which will be likely to give older readers much amusement, is not of a kind to be appreciated by the little people. No author is given, but in many ways the book reads more like a translation than an original work. The American publishers have printed it very carelessly.

"Black Peter." Scissor Pictures, by Paul Konewka. With Rhymes from the German. New York: Hurd & Houghton.

"Puck's Nightly Pranks." Illustrated by Paul Konewka. Translated from the German of Ludwig Bund, by Charles T. Brooks. Boston: Roberts Brothers. 1871.

"Clever Jack; or, The Adventures of a Donkey. Written by Himself." With fifty-four Illustrations. Philadelphia: J. B. Lippincott & Co. 1871.

"One Trip More, and Other Stories. By the Author of 'Mary Powell,'" etc., etc. With Illustrations. New York: Cassell, Petter & Galpin.

"Peoples of the World. By Bessie Parkes-Belloc." With numerous Illustrations. New York: Cassell, Petter & Galpin.

"Our Domestic Pets. By the Rev. J. G. Wood, M. A." With Illustrations by the Brothers Dalziel. New York: George Routledge & Sons.

A volume of short stories by the "Author of Mary Powell," which seems to be intended for a "juvenile," is not likely to afford very much pleasure to any class of readers. Both the style and the subjects of the tales will be apt to mystify more than they will amuse children, and their elders may not improbably find the essential commonplaceness of the matter of the book brought into rather disagreeable prominence by the affectation of its manner.

A very good book to give to intelligent children who have already done a good deal of reading is the "Peoples of the World," by Bessie Parkes-Belloc. It is a well-bound and well-printed volume of short essays on all, or nearly all, races and tribes of men, which convey a good deal of information in an interesting way. The book shows extensive reading, quick observation, and a ready intelligence, and is marked throughout with an evident intention to be perfectly fair, which gives one a very pleasant impression of the author, and is sometimes not a little amusing, as, for instance, when she remarks how much easier it is to describe what one knows but little about than what one knows very well, or says that she can give her readers no just idea of the state of the population in Rome, because different travellers describe the same things in precisely opposite terms, accordingly as they are prejudiced in favor of or against the Roman Catholic religion. As a "juvenile" it has this advantage over many of the books provided for children, that it is thoroughly entertaining without being at all exciting, so that its readers, instead of devouring it in haste and then growing tired of it, will be apt to pore over it at their leisure, and to find both pleasure and profit in it.

"Our Domestic Pets" gives a good deal of information about the best ways of caging and taming various birds, insects, and animals, which all children who care for pets, as most children do, ought to find interesting and valuable. Mr. Wood writes pleasantly, and with a practical knowledge of his subject which, while it admirably adapts his work to the children for whom it was intended, makes it also agreeable reading for such of their elders as take interest in the various matters discussed. The hiving and swarming of bees, the care of silk-worms, and the management of canaries, are among the numerous topics treated, and the letterpress is accompanied by sufficiently careful diagrams and illustrations.

JUST PUBLISHED BY

PORTER & COATES,

822 Chestnut Street, Philadelphia.

Longfellow's Poets and Poetry of Europe.

A New and Revised Edition, just completed, by H. W. Longfellow, with the addition of 150 pages of entirely new matter never before published, making it one of the most elegant and complete works extant. With Introduction, Biographical Notices, and Translations, from the earliest period to the present time. By Prof. Henry Wadsworth Longfellow. Illustrated with engravings on steel and engraved title. Imp. 8vo, cloth, extra gilt top, bevelled boards, $6; sheep, marble edges, library style, $7 50; half-calf, gilt, $9; Turkey morocco, $12.

"This valuable work contains selections from about four hundred authors, translated from ten languages. Mr. Longfellow himself gives us translations from all these languages but two."—Allibone's Dict. of Authors.

"This edition has been revised and enlarged by the author, and contains his last touches and additions to his labors."—The Age, Philadelphia, Nov. 3, 1870.

"It is now a better book than ever, the Professor having added an Appendix and a Supplement, the latter dated 1870, containing a very precious list of newer poetical translations. . . . The supplement is very choice and interesting, and absolutely rejuvenates the work. Here we have specimens from Bayard Taylor's translation of 'Faust,' not yet received in complete book-form, etc., etc."—Evening Bulletin, Philadelphia, Nov. 5, 1870.

Hedge's Prose Writers of Germany.

A NEW AND REVISED EDITION.

With Introduction, Biographical Notices, and Translations. By FREDERIC H. HEDGE, D.D. With Six Portraits on Steel and Engraved Title. Imperial 8vo, cloth extra, gilt top, bevelled boards, $5; sheep, marbled edges, library style, $6; half-calf, gilt, $7 50; Turkey morocco, $10.

"There is no book accessible to the English or American reader which can furnish so comprehensive and symmetrical a view of German literature to the uninitiated; and those already conversant with some of the German classics will find here valuable and edifying extracts from works to which very few in this country can gain access."—Prof. A. P. Peabody, in North American Review.

"A new and beautiful edition of a work of sterling merit."—The Age, Philadelphia, Oct. 29, 1870.

"It is a photograph such as is very much needed at this juncture for instant study."—N. A. and U. S. Gazette, Philadelphia, Oct. 27, 1870.

"Universally recognized as one of the best collections of specimens of German literature in the English language."—New York Tribune, Oct. 28, 1870.

"Its merits and value are well known. In this enlarged edition it will be sure to find renewed favor."—Boston Post, Nov. 3, 1870.

A NEW GLOBE EDITION OF

THE WAVERLEY NOVELS.

BY SIR WALTER SCOTT.

In 16mo size, on toned paper, illustrated. The most attractive edition for a small amount of money published in the country. Complete in 23 vols. Green cloth, extra, per vol., $1 25; per set, $28 75. Half-calf, gilt back, per vol. $3; per set, $69.

ALSO,

Tales of a Grandfather.

GLOBE EDITION.

To match the new Globe Edition of Waverley. 4 vols., green cloth, extra, per vol., $1 25; per set, $5. Half-calf, gilt, per vol., $3; per set, $12.

The only edition containing the Fourth Series, "Tales from French History." This is the only complete edition published.

IN PRESS.

AMERICAN ORNITHOLOGY;

Or, The Natural History of the Birds of the United States. Illustrated with Plates engraved and colored from original Drawings taken from Nature. By ALEXANDER WILSON. With a Sketch of the Life of the Author, by GEORGE ORD, F.R.S., etc. With Bonaparte's Continuation, containing the Natural History of Birds inhabiting the United States not given by Wilson. With Figures drawn, engraved, and colored from Nature, by CHARLES LUCIEN BONAPARTE (Prince of Musignano). 3 vols. imperial 8vo, with a folio volume of carefully colored plates, embracing nearly 400 figures of birds, mostly life size.

In offering to the trade and the public a new edition of Wilson and Bonaparte's American Ornithology, long known to naturalists as THE BEST and most thorough work on the subject ever published, we desire to call attention to, 1st, The superiority of this work over all others, for the accuracy of the drawing and engraving—these plates having been engraved on copper by Lawson, "the first ornithological engraver of our age," every feather is accurately represented, which CANNOT be done, as it usually is, on stone; 2d. The birds are drawn to the size of life, wherever possible to get them into the size of the atlas, so that every one can recognize them; 3d. The elegant manner in which they are issued, as they are printed from new stereotype plates on the finest laid paper, in clear pica type; and the plates are printed from the original plates of Wilson and Bonaparte, and colored after the authors' own copies. It is not only one of the most creditable specimens of book-making, but probably the finest work of the kind ever published.

Griswold's Prose Writers of America.

New edition, revised, and brought down to the present time.

The Nation.

NEW YORK, THURSDAY, DECEMBER 22, 1870.

The Week.

THERE appears to be little doubt that Mr. Schenck goes to England with instructions which, combined with his own skill, will most probably secure a final and satisfactory settlement of the *Alabama* question. He is, we believe, charged to negotiate on a basis which is substantially that traced out by Dr. Bluntschli, of Berlin, in the article in the *Revue de Droit International*, of which we gave a summary some months ago, viz., the payment of all damage done by the *Alabama*, with interest on the amount, and of all expenses incurred by the United States Government on account of the *Alabama*—meaning by this, we presume, expenses directly incurred—and the issue of a joint declaration, recognizing as of perpetual obligation the rules of international law, of the violation of which the payment of the money is an implied confession. Consequential damages will not be talked of, and no formal apology will be demanded. In fact, if the reports from Washington be true, Dr. Bluntschli's programme will not be departed from on the American side, except as regards the demand for Government expenses, and we doubt very much whether even on this point there will be much difference of opinion. It is safe to predict, too, that the negotiation will be conducted by Mr. Schenck in a way of which neither Englishmen nor Americans will find reason to complain, and which will prevent any miscarriage either through over-zeal or want of astuteness. He is, as we said last week, an able man, long versed in affairs, and will command in a work of this kind perhaps more of the confidence of Congress and of the country than anybody whom we could name who is now in public life.

Should our anticipations as to the result of his mission prove correct, it will be one more illustration of the value of the power over the popular mind of the thorough discussion even of questions on which passions have been most powerfully and justifiably excited. Four or five years ago it was very difficult to see any way to the settlement of the *Alabama* case except through war, so great was the unwillingness of a very large portion of the public to look at it in the dry light of international usage. The legal aspects of the case were only just beginning to struggle into view when Mr. Sumner delivered his famous speech, which once more plunged the whole affair into confusion, and seemed to make any sane solution more difficult than ever. His recital of the wrongs of the United States, if accepted as correct, made it plain, as was humorously said by somebody at the time, that nothing short of the appearance of the Queen barefooted at Washington, "leading her progeny in chains," would adequately atone for them. Failing this, the cession of Canada, as an act of contrition, accompanied by a full confession of baseness and negligence, not unnaturally began to be talked of as a very proper penalty to exact of England. The calm repudiation of all this absurdity, at the very moment, too, when the condition of Europe offers an obvious temptation to the United States to make their demands exorbitant, and the final presentation to Great Britain of a basis of negotiation which, it is certain, is the very least that any arbitrator would award, is, we do not hesitate to say, as remarkable an illustration of the healthiness of the public conscience in America as could be wished for, and as important a contribution to the civilization of the world as any nation has ever made. Should the controversy with Great Britain end in a solid and valuable addition to the fabric of international law, it would be difficult to imagine a more appropriate close to the great struggle, which has been already made illustrious, not by emancipation only, but by the unprecedented fact that in it, rebellion though it was, no man lost his life for a political offence, except in open fight.

Mr. Charles Francis Adams's address before the Historical Society of this city, last week, recalled very vividly the opening and anxious stages of that controversy, and probably nobody who listened to his masterly recital of the story of the "American struggle for neutrality," remembering the distinguished part the orator had played in the attempt to enforce against England the American rules of neutrality, but must have regretted that it had not fallen to his lot to close the great debate which he so vigorously began and maintained with such extraordinary fortitude and ability through the vicissitudes of the war. The man who, in 1863, bore the brunt of the diplomatic battle, every one would have been glad to see enjoying the triumph of 1871; but, since this was not to be, it was both pleasant and instructive to hear him throw the light of history, and of a personal experience of exceeding richness and variety, on the problems which still present themselves for solution in American foreign policy. The danger of attempting to solve foreign complications in the midst of a gust of popular passion, the value of statesmen who know how to stand firm till the gust passes by, the terrible nature of mistakes in foreign policy, the inestimable value of neutrality and peace, the folly of trying to obtain through war anything of equal moment, were lessons which he preached; but, though the man who uttered them stood on the stage, the voice was the calm and distant voice of bygone generations, and his illustrations were drawn from conflicts once fierce and exciting, of which hardly an echo has reached through ordinary channels the public of to-day.

The amnesty question has been the main occupation of Congress during the week, the Senate's part being confined to the encounter between Messrs. Schurz and Drake. In the House, General Butler's bill has staggered from the first under a load of substitutes and amendments, and its defeat is not doubtful. The only other incident of the sessions last week that need be noticed is the introduction, by Mr. Fenton, of resolutions, which were promptly passed, calling for certain information which he will be very lucky to get, and of which Messrs. Conkling and Murphy will not be overjoyed to furnish their portion. Our long-headed Senator asks of the Committee on Retrenchment a "comparative detailed statement" of the cost of collecting the customs at the ports of New York, Boston, Philadelphia, Baltimore, New Orleans, and San Francisco, and a particular report on the present system and practices connected with the "warehousing business," and the "general-order business," and cartage of goods while in custody of Government at this port. And Mr. Fenton has the impertinence to ask the Secretary of the Treasury for some light on what is one of the greatest scandals of our civil service, and one of the greatest sources of corruption and oppression, not only that ever existed in this country, but, perhaps, anywhere among a civilized people. We refer to the system of fines, penalties, forfeitures, and seizures, concerning which Mr. Fenton would like to know what amounts they have brought into the Treasury in the last three years; whether they were obtained by judgment in court, by settlement, or by compromises with the parties detected in fraud, and for what causes exactions were made; also, how much was paid out of these Treasury dues as moieties to customs officers, informers, etc.; the names of the victims who suffered to the extent of $1,000 or more; and, finally, the names of smugglers and other persons defrauding the revenue who have been prosecuted, criminally convicted, and punished otherwise than by payment of money. We hope Mr. Fenton will insist on every item of this dark chapter.

The only incident of importance in Congress during the week has been the "set-to" between Messrs. Schurz and Drake, arising out of the late contest in Missouri. Mr. Schurz made an elaborate speech, giving the history of the late split in the Republican party in that State. It was due, he said, *in toto*, to a desire to be rid of the "infernal" system of disfranchisement, and had nothing to do with the "revenue reform" movement, "though, had the question of protection or anti-protection been the only question before the people of Missouri, the majority against protection would, in all probability, have been nearer one hundred thousand than forty thousand." He then turned upon Mr. Drake personally, and castigated him, more in sorrow than in anger, treating his offences as the result of a "morbid hallucination," and forgiving him for "the piece of low demagogism" perpetrated in insinuating that, because Mr. Schurz was a German, he "cared less for the industries of America than for the industries of his fatherland."

Mr. Drake, who has just been appointed Judge of the Court of Claims, replied on the following day, in a long string of direct contradictions and accusations, of which the principal were, that Mr. Schurz's object in what he had done in Missouri was to go over to the Democrats himself and carry the Germans with him, and that the enfranchisement of the ex-rebels was treason towards loyal men, and dangerous to the State; that the President's interference in the State election was very proper, and that Mr. Drake took the responsibility of advising it, and believed no man should hold office under a party while warring against it. Mr. Drake's speech had, on the whole, owing to his retirement (we hope complete) from the political arena, only a personal interest.

North Carolina is about to enjoy an entertainment of considerable promise, in the shape of an impeachment of Governor Holden for embodying troops, and inflicting on divers persons "extra-constitutional" captures, searches, imprisonments, and other bodily indignities, on pretence of suppressing violence and outrage, and denying them the benefit of the writ of habeas corpus. There is no doubt there was violence and outrage, and a great deal; but we suppose there is no doubt, also, that when Mr. Holden found himself at the head of his troops, the precedents of the war period ran in his head more than was good for him or the community. His indiscretions have been of a kind, however, that in most States and in ordinary times would be covered by an act of indemnity, but in North Carolina moderation is just now held in great contempt. The proceedings are, it is said, to be enlivened by Butler's appearance as counsel for the accused; and the accused himself is reported to be making an attempt to get the weather-gage of his enemies by "professing religion" and having himself publicly baptized by immersion. No record of any similar preparation for impeachment is, we believe, to be found in the books, and the effect of it will be watched by jurists with deep interest.

There has been a protectionist dinner on a large scale during the week, which was intended by the friends of American industry for the woollen manufacturers, doubtless as a counterblast to the late free-trade demonstration; but, through a mistake of the caterer, the bill of fare was made to offer the feast to the wool-growers, a body of gentlemen who are just now in rather bad odor, both with wool-dealers and woollen manufacturers. There seems also to have been some misunderstanding as to the nature of the occasion, many of those present not having been prepared for the broad and voluminous statements of protectionist doctrine of which the speeches of the evening, except that of Dr. Bellows, consisted. Some strange things were heard in the course of the evening, as, for instance, Mr. Mudge, the chairman's announcement that Colbert's protective system "enabled France to carry on a war with Europe for fifty years," and "placed her at the head of all civilized nations as a manufacturing people," and, besides this, enabled her to pay equal attention to agriculture. We should like to know how Mr. Mudge can tell that these remarkable results were not due to the wearing by Louis XIV. of a full-bottomed wig, and to the persecution of the Protestants. The very same argument can be used in support of both views. Mr. Mudge made another statement, which we are sorry to pronounce not exactly untrue, but disingenuous, viz., that the number of paupers in Great Britain had been increasing since the adoption of a high tariff by the United States. The question of importance in this discussion is whether the number of paupers has increased in proportion to population, other elements in the problem remaining the same. Now, if Mr. Mudge had examined the question as he ought to have done, he would have found that the percentage of pauperism in England is less than it was before 1846, and if he had been perfectly candid, he would have acknowledged that our tariff neither could nor would have prevented the great cotton dearth of 1861. Dr. Bellows seems to have been rather startled by much of what he heard. As a preacher of human brotherhood, he must have been surprised to learn that God Almighty had so arranged matters that the less intercourse nations had with each other, the better. As a Christian, he must have been startled to hear it mentioned, as one of the recommendations of the American tariff, that it has increased the number of paupers in England.

In business circles the week has been a rather eventful one. The unusually large receipts of cotton, and the vigorous opening of the belated pork-packing season, have resulted in a decided, but not severe, drain of currency from the city to the country. The preparations, usual at this season, for the January settlements and New Year's dividends, have added somewhat to the natural stringency of money, which has been further and artificially intensified by the various means known to Wall Street manipulators, and employed for the purposes of affecting the stock market. At the Stock Exchange there has been a severe fall in prices, but without seriously affecting any one except the same old gambling cliques and their adherents. A more serious influence has been exerted by the measures instituted by Mr. Boutwell against the Pacific Railroad Companies, which were immediately followed by lively rumors of his intended resignation. Although the amount of the securities of these roads held here is not believed to be large, the depression which resulted from the first announcement of the Secretary's intentions has had a bad effect upon the market for all similar securities, has added to the prevailing feeling of uneasiness, and has started the usual plentiful crop of unfavorable rumors. There have, however, been no serious complications of any kind, as far as can be ascertained, and about this time it is always safe to mistrust financial rumors, unless thoroughly authenticated. There is, however, enough to account for the prevailing despondency in trade circles without looking to foolish stories. The strike among the shoemakers has been followed by a whole string of failures in Philadelphia, and the suspension of the coal-miners is assuming a serious aspect from the prospect of a similar stoppage among some of the iron-mills, which are said to be running at a loss. In all manufacturing industries reductions of wages are the order of the day, and "unprofitableness" is the complaint made almost universally of every class of business. Mr. Boutwell's predicted falling off in the Treasury surplus promises to be fulfilled sooner than he anticipated.

"M. C. W." writes to us that the resolution in the Woman's Rights Convention, sending Mrs. Emilie J. Meriman to France as their "peace advocate and commissioner," on which we commented some weeks ago, "whatever the reporters may have thought, was not adopted by the Convention, but merely read at the earnest request of Mrs. Meriman, no subsequent action having been taken;" and she adds, "Whatever the action of the Convention may have been, the conscientious offering of the resolution was worthy of respectful mention, if any." It thus appears that, though we were at first assured that there was no resolution such as we criticised, there really *was* one; but the reporter of the *Times* was in error as to its having been passed. Of whatever difference there may be between reading anything so silly and passing it, we are very willing the Convention should have the benefit. But we are sorry to dissent from "M. C. W.'s" view of the way the *Nation* ought to have treated it. Gross folly, especially coming from people who will have it that their participation in the work of government will work a remarkable change in the condition of the civilized world, is not, in our opinion, entitled to "respectful mention," and will never receive it, no matter how "conscientiously" it may be committed.

The *World* falls into a singular error, in arguing against the notion that Butler's Amnesty Bill ought not to be prejudiced by the character of its author—who, it says, is a natural product, with which it is as useless to quarrel as with one's stature. It is "a moral necessity" that he should be what he is, and therefore we may as well accept him without criticism. This is all true of Benjamin F. Butler, the man; that is the work of the Almighty, and one of his mysteries, like pain, death, and sorrow. But General Butler, the legislator, the framer of bills and resolutions, and the author of the Amnesty Bill, is a distinctly human creation, just as much as a bad picture, or an ill-cooked meal. Such as we see him, certain fellow-men in Massachusetts, including several professed "moralists," made him, and to release them ever, as long as his voice is heard in public life, from one iota of their responsibility for him would be wrong, if it were possible. It is they who for the last three years have been working whatever demoralization in public life he is usually charged with. When he tries to cheat the public creditor, he is but their agent; when he denies the existence of a public conscience, it is their voice which is heard; when he proposes to make party "capital" by entering on a bloody war, it is by the shoulders of those who voted for him, and endorsed him and recommended him, that the fiend stands mocking. We must not let them escape because two or three years have slipped by since they "wrought the deed of shame."

Important movements, and not unimportant fighting, have taken place at the various seats of the war in France. General Chauzy, having been forced from his position around Beaugency, "after four days' fighting," as King William telegraphs, retired first towards Blois, but subsequently in a northwesterly direction to Vendôme, abandoning the south banks of the Loire to the Prussians, who occupied Contres, Montrichard, and Romorantin, between Bourges and Tours. The retreat of Chauzy in the direction of Le Mans makes it clear that it is the determination of the French Government to risk the chances of another campaign north of the Loire, in the hope of defending Brittany, Western Normandy, and Maine, and, if fortune be more favorable than it has been till now, of combining an attack on the besiegers of Paris with the defenders of Havre and the Army of the North. The opening of this new movement, however, is far from being favorable to the French army, though Gambetta continues to send rose-colored reports about it to his associates now in Bordeaux. Scarcely had Chauzy established his forces on the banks of the Loir, when the Grand-Duke of Mecklenburg occupied in strong force the town of Fréteval on his left flank, December 14, and on the following day, having been reinforced by Frederic Charles's Tenth Corps, engaged the French near Vendôme. The battle was severe, and ended with the discomfiture of the French, who abandoned Vendôme on the 16th, leaving six guns and one mitrailleuse in the hands of the pursuers, and hastily retreated towards Le Mans, beyond Épuisay, which Von der Tann occupied on the 17th, capturing two hundred and thirty prisoners. A less important fight at Brou, between Chartres and Le Mans, also ended with the defeat of the French. Concerning the state of Paris, its means of resistance, and the preparations to bombard it, the reports and speculations are most varied, and frequently much more amusing than instructive. The very positiveness of the assertions now made about the abundance of provisions leads us, in view of what we heard before the fall of Metz, to look for an early surrender. The new sortie, reported last week to have taken place on the 10th, is not spoken of in more recent reports. The warlike movements north and northwest of the besieged capital are the themes of numerous but exceedingly vague and untrustworthy despatches. We hear of desultory fighting in Picardy, of the advance of the French General Faidherbe "beyond Amiens," of the occupation of Ham by the Prussians, of their passing Chauny twenty thousand strong, and of various menacing movements against Havre, made by General Manteuffel's army, both north and south of the Seine.

The Chancellor of North Germany—we ought now, perhaps, to say of the German Empire—seems not to be satisfied with having "abolished the Main," and united thirty-eight million Germans under the headship of his master, with a very fair prospect of enlarging the Fatherland by the reannexation of Alsace and Lorraine. He obviously covets the possession of the Grand-Duchy of Luxemburg, which, from 1815 to 1866, though belonging to the King of Holland—not to the kingdom, however—formed a part of the Germanic Confederation, and, on the breaking up of the latter by Prussia in the last-mentioned year, became an independent sovereignty under the House of Orange. The attempt of its royal owner to sell it to France, in the early part of 1867, led to a grave diplomatic complication, which seriously threatened war, but ended with the withdrawal of Napoleon and William of Orange from the bargain, on one side, and the withdrawal, on the other, of the Prussians from the capital, Luxemburg—a fortress which they had continued to garrison, though without right, after the fall of the Bund. The fortifications of the city were to be razed, and Luxemburg was declared a neutral country like Belgium. Against this Grand-Duchy Bismarck now suddenly raises the portentous accusation of having violated its neutrality during the pending war, by allowing the revictualling, from its territory, of the lately reduced fortress of Thionville, situated near its border, and by omitting to stop French fugitives—and even suffering the French Consul to re-enlist them—while forbidding the transit of wounded Germans. And this hostile attitude of Luxemburg, Count Bismarck declares in a circular to the ambassadors of his court, gives him the right of disregarding its neutrality, which obviously means the right of occupying it.

This new firebrand thrown into the diplomatic world so soon after Gortchakoff had launched his, has caused an intense excitement in England, as well as on the Continent. It is regarded not only as a fresh earnest of Prussia's aggressiveness and insatiability, but it has also made the suspicion of a collusion between her and Russia, mutually granting—if not securing—freedom of expansion in the East and West, respectively, more plausible than it appeared a few weeks ago. And this suspicion is still further strengthened by Gortchakoff's reply to Bismarck's note on this question, in which the Russian diplomat is reported to declare that if the charges alleged against the Luxemburg Government are proved, "Prussia is justified in annexing the territory." The English and Austrian journals naturally teem with denunciations of the grasping policy of the German Chancellor, and the *Pall Mall Gazette*, among others, urges the British Government not to allow the threatened violation of the territory of Luxemburg to pass with impunity. On the other hand, hopes are freely expressed in official and non-official circles of an amicable settlement preventing a practical enforcement of Bismarck's theories. Such a settlement would be, for instance, Luxemburg's entering the German Confederation or Empire as an "immediate" member, under the semi-sovereignty of Henry of Orange, the brother of the King of Holland, and actual Governor of the Grand-Duchy. The "people," the clergy, and the "Patriotic Committee" of the country, however, vehemently protest against any curtailment of its full independence, and the declarations both of the King of Holland and of his brother are reported to agree with their wishes.

The Catholic associations and corporations, civil and ecclesiastical, lay and clerical, in this country, are pouring in addresses of sympathy on the Pope, many of which are curious and instructive reading, and all of which display the usual sentimentalists' contempt for facts. According to one, "the government of Florence" (which is the "scathing" mode of designating the Government of Victor Emmanuel) "has established despotism and fettered the press" at Rome, and has deprived His Holiness and the Catholic Christians of New York of "the right of communicating freely with each other." Another meeting, held in the cathedral at Albany, declares "the personal independence of the Sovereign Pontiff" "a right dear to American citizens." We would suggest a recognition of it in the constitution of the State of New York, or, better still, in the city charter. In the meantime, the Sovereign Pontiff refuses to be released from his bondage. He remains under the odious rule of the infidel government in the Vatican, and will have it that no Catholic can have access to him, except across Italian bayonets, in spite of the frantic endeavors of the Italian Government to make him as free and independent as possible. In fact, there is no reason, so far as the facts go, why he should not assert, and American Catholics mourn over the announcement, that he is bastinadoed every morning regularly by an Italian corporal, just as well as that the Italians are restraining him of his liberty. Most of the Catholic talk about him, like much of the Woman's Rights talk, impels one to ask whether the distinction between children and adults is not mainly one of physical size and weight, instead of being one of intellectual power, as is commonly supposed.

THE SPECTACULAR THEORY OF WAR.

THERE could hardly have been a better justification of the course of the King of Prussia in persisting in the prosecution of the war, after the fall of the Empire, than the arguments put forward by Russia and her partisans in defence of her violation of the Treaty of Paris, and let us add that it would be difficult to imagine a more serious blow at the cause of peace than would be inflicted by the general acquiescence of civilized nations in their validity. We do not pretend, as we have said already, to attach any peculiar sanctity or permanence to this treaty, or to consider the wish of Russia for its abrogation as anything unnatural or unreasonable. Moreover, we have no doubt that it has lasted its day, and that all the good that can ever result from it has been got out of it. A frank appeal to the co-signataries for release from its obligations would probably have commanded the sympathy and support of most thinking men. Treaties are not meant to last for ever any more than laws, and if Russia had, by force of argument, procured the abolition or modification of this one, or, at all events, had fairly tried argument before announcing her determination to take the law into her own hands, she would have made a very valuable contribution to civilization.

But when she and her friends get up and say—as they do say—that this treaty was imposed on her by force, and that *therefore* she is not bound to observe it beyond the period at which she finds herself strong enough to disregard it, they help to give back to war a character of barbarism of which all Christian nations have for two centuries been steadily and successfully laboring to divest it. All the humane changes which have, during that period, been introduced into the mode of conducting it—the better treatment of prisoners and of the wounded; the more careful avoidance of unnecessary killing; the greater respect for the property and persons of non-combatants, and particularly for those of the inhabitants of fortified places; the greater regard shown for the preservation of public monuments and works of art—have all been signs of the gradual reduction of military operations to a means simply of deciding international disputes. The element of vengeance or hate, which formerly played so large a part in the cause of hostilities, is now carefully eliminated from it, so carefully that it would be difficult to find a public man in Christendom who would come forward and claim for this feeling a place among the good reasons for drawing the sword; and nothing excites more disgust and reprobation than acts of war which clearly have no tendency to bring the struggle to a conclusion. War is, to be sure, at best, a coarse, clumsy, and savage mode of trying causes, but it is apparently the best which is, in the present state of human nature, attainable. But its only claim to respectability, and the only good reason for looking on the shock of civilized armies as anything better than an Indian massacre, is that it *is* a mode of trying causes—that it *does* settle questions of right and duty, which, as yet, there is no other way of settling.

The sword is a more honorable weapon than poison or the knife, mainly because it helps to determine, by the general consent of the civilized world, who shall possess certain tracts of territory, or exercise certain powers of government, or what acts or practices are between nations permissible or not permissible. Deny this prerogative to the sword; reduce it to a mere trial of brute strength, which shall settle nothing but which of the combatants had in a certain year the best army, or navy, or generals, and we fling away one of the strongest guarantees of peace, and, let us add, we inflict almost fatal injury on the sentiment to which we must look for the eventual establishment of an international tribunal, which shall do away with war altogether. That sentiment is, we need hardly say, respect for decisions reached through means to which both parties to the controversy have appealed, and have tacitly or openly agreed to consider effectual. A treaty made at the close of a war, and which settles the points over which the war was waged, is in reality the final judgment in a proceeding which all civilized nations are and have long been trying to make as nearly judicial as its nature will permit. It is not, of course, entitled to the same respect as the judgment of pure reason, but no such judgment is attainable even through courts of law. Judicial decisions are not what we would like, but the best thing we can get, and we all uphold them because we are all interested even more in having an end of strife than in having strict justice done. The principle, too, on which the judgments of the sword rest—that the stronger of two parties shall have his way—brutal as it seems, is neither more nor less than the principle on which democratic government rests—that the majority shall rule. The only good reason under the sun why the majority should rule is the one given by Barbeyrac, "because there is no other mode of bringing business to a conclusion," or, in other words, because the majority is the only power in a state capable, if need be, of enforcing its decisions.

When, therefore, a community deliberately appeals to the sword to decide a controversy with another nation, as Russia did in 1853, and the South in 1860, and as France did this year, every civilized man is interested in having the defeated party abide by the issue, as embodied in the treaty by which the war is closed. All wars end in one party acknowledging its defeat, and the treaty is but the formal recognition of the judgment of the Lord of Hosts. Of course, nobody intends treaties to be perpetual, and nobody expects them to be so; but everybody expects them to last till there is some other change in circumstances than a recovery of strength on one side or the loss of it on the other. Any other mode of looking at them than this would submit international relations to the rule of brute force, pure and simple.

The partisans both of the French and of the Russians have, however, of late been doing their best to spread what we may call the prize-fighter's view of war—that is, the doctrine that it is a trial of military strength and skill simply, and that, beyond settling on which side the superiority in these things lies in a particular year, it settles nothing; that, in other words, it creates no rights and imposes no duties—not even on the belligerent who, at his own time and for his own reasons, has resorted to it. Accordingly, we find King William severely rated for not having withdrawn his forces as soon as the French regular armies had been defeated, the fight, according to "the rules of the ring," being then over; and the fact that the French people were still bursting with rage and humiliation, and made no secret of their sorrow that they should have gone into the contest "unprepared," and of their intention to take their revenge as soon as they could recover, counting for nothing. The French, we were told, "had been beaten enough," and the advantage being plainly with the Prussians, and the fight having, therefore, lost all spectacular interest, hundreds of people who professed never to have any doubt of the original righteousness of the German cause transferred their sympathy to the French, just as a gambler sides with "the under dog" or the losing cock as soon as there is nothing more to bet on. This way of looking at war as a gladiatorial exhibition, which ought to come to a close as soon as the spectators have ceased to get excitement out of it, was dignified by the English friends of the Southern Confederacy during the rebellion as "sympathy with the weaker side," and a large portion of the abuse they lavished on the North for continuing the struggle they unblushingly justified by pointing to the "gallantry" of the Southern resistance, being evidently of opinion that there was no moral element in the struggle whatever, and that, the question of superiority of force having been settled, there was nothing further to fight about; and that it was a shame to try to force the plucky vanquished into formal confession of his defeat and formal acceptance of its consequences.

Seen from the benches of the amphitheatre, of course, there is nothing objectionable in the position Russia has taken up in this controversy about the neutrality of the Black Sea. Russia went to war in 1853, signed something in the nature of a treaty simply because she found it inconvenient to fight any longer, and now that she has recovered her strength, and that of her adversaries is diminished, she goes at it again, the period of acquiescence in the terms imposed by the victor having been simply a breathing spell. It would be difficult to overestimate the evil influence on the world's progress which anything like a general acceptance of this view of the nature and effect of war would exercise. The larger armies grow, the more human industry and ingenuity are devoted to the perfection of the arts of destruction, and the more thoroughly entire nations are enlisted in armed conflicts—we must remember "the Prussian system" is being generally adopted—the more necessary it is in the interest of civilization and humanity to treat war as really and truly not a game, but a judicial process; not as a means of trying strength, but of settling the relations of great communities to each other. It may seem horrible to ascribe to mutual slaughter the dignity and the functions of a legal arbitrament, but it is not half so horrible and so degrading as to treat fighting as simply a means of finding out which of two nations is able to kill and wound more of its enemies in a given period. It is sad to think that nations should still, in the nineteenth century of Christianity, have to work out their doctrines and settle their place among their fellows, to use Bismarck's phrase, by "blood and iron;" but it would be infinitely sadder if we should ever have to acknowledge that battles were only fought for show. The sorrow which darkens thousands of homes day by day in all great wars is sweetened in modern times, at least to most mourners, by the reflection that those who have laid down their lives have helped to end some great contention or solve some perplexing problem of national existence. It would greatly deepen the misery and desolation of war if the dismal mounds which dot every battle-field were to become nothing better than memorials of the victor's prowess.

THE TRUTH ABOUT LAND GRANTS.

The people of the United States justly attribute a great part of their rapid progress in material wealth to their possession of large tracts of fertile lands easily accessible from the sea, and not held in individual ownership, but belonging to the State, whose only duty in regard to them is to use them to the best advantage of the community at large. The magnitude of this national patrimony is so great that it is difficult to form an adequate conception of it even by the aid of figures, and many reasons have combined to withdraw public attention from the figures more than from any other part of the subject. The total area of the United States is, in round numbers, 2,200 millions of acres, of which less than one-fifth, or about 400 millions of acres, have passed into the possession of individuals, and over four-fifths remain in possession of the country at large. It is the disposal of these four-fifths of the entire United States, the disposal of 1,820 millions of acres of land, or territory nearly five times as large as the total settled portion of our country, that forms the great "public land" problem which the present generation will be shortly called upon to solve, or at least seriously to consider.

The conviction of the people that their prosperity has been largely due to the possession and gradual cultivation of these large territories, has naturally grown into a national dogma that the continued prosperity of the country requires a continued progress in the cultivation of larger and still larger portions of our unoccupied domain. Whether well founded or not, this national faith has furnished the sole principle on which our management of the public lands has been conducted. The most rapid transfer possible of the proprietary interest from the Government to individuals has been the Government policy, and has had the warm support of the people. Whatever seemed to promise a speedy settlement of the public domain was approved almost in advance by public sentiment. The sale of land at nominal figures, the free gift of land to actual settlers under the Homestead Law of 1862, the most liberal grants for military services, for agricultural colleges, for schools and universities, were all in accord with popular feeling. Even the earliest grants to railroads and canals were unanimously welcomed, and it is only within the last few years that a doubt has arisen in the public mind as to whether, after all, the policy of giving away the lands almost indiscriminately to great railroad corporations is as wise as we thought it to be ten years ago. In the West, especially, this doubt has almost developed into positive opposition, and not only was the cessation of land grants made a prominent issue in many local platforms of both parties, but many leading men in both Houses of Congress, as well as President Grant, have openly expressed their downright hostility to the present system. It is worth while enquiring what has caused this change of sentiment.

The first influence affecting the public mind has no doubt been a consideration of the almost fabulous magnitude of the gifts thus made by the people to certain individuals. The total extent of lands positively given away by the people of the United States, principally to railroad corporations, up to the end of 1869, amounted to 186 millions of acres, a territory as large as that of Great Britain and France combined, while the last session of Congress entertained applications for and partially granted a further amount of 190 millions of acres, exceeding the combined area of Spain, Italy, and Switzerland, and is now preparing to receive applications for as much more. The land actually granted is four times as large as the whole of New England, twice as large as all the Central Atlantic States combined, including Ohio, and half as large again as the five Southern Atlantic States, or as the five Central Southern States, or as the five great Western States of Illinois, Indiana, Iowa, Wisconsin, and Michigan united. All ordinary means of estimating size and value fail before these stupendous amounts. Yet this is only what has been irrevocably given. The grants now under more or less favorable consideration by Congress would double them, and the grants asked for, but not yet considered, would more than treble them. It is no wonder that public opinion halts at the idea of giving away to private individuals a territory as big as half of Europe.

But even the magnitude of the gift has scarcely aroused public opinion as much as the evil influence which the opportunity of making these gigantic gifts has had upon the conduct of public affairs, the character of legislators, and the actions of public officials. Not even the tariff has led to so much lobbying, so many corrupt influences, and such neglect of other public business, as the incessant applications of railroad and other corporations for more grants of public lands. Over one hundred companies are now before Congress with applications of this kind, each represented by from two to ten agents, who fill the lobbies of the Capitol, who crowd the committee rooms, who bore the life out of honest members, and fill the pockets, or at least the pocket-books, of the less scrupulous ones with current or uncurrent promises to pay. The waste of time, the disgraceful wranglings, the charges of corruption, and the palpable neglect of legitimate business have so disgusted the public that the enquiry has become common: Do these enormous grants, which seem in themselves the source of so much evil, really result in the advantages which have been anticipated from them? Do they really cause our waste territories to be more rapidly settled?

What the indirect influence of the roads may be, it is as yet next to impossible to determine. But that their direct influence, by sales of their own, materially affects the settlement of the country, is now demonstrated to be a delusion. Of the total lands for which the United States issued patents or title-deeds last year, to wit, 7,660,000 acres, nearly four-fifths were for cash sales and homestead entries, only a very small portion of which were along the lines of the subsidized railroad companies, while the entire amount certified or delivered to all subsidized corporations of whatsoever nature was less than 750,000 acres, or less than one-tenth of the entire amount disposed of, showing that the total sales of all the companies together, including town-sites and railroad depots, etc., was less than one-eighth of what the Government itself sold, and received a valuable consideration for. At this rate of annual sales it would require about 250 years for the existing companies to dispose of the lands given them by the United States, supposing they should be able to continue their sales for town-sites, railroad depots, etc., at the present ratio, which can scarcely be expected. That this proportion of sales is fairly divided among the different lines is apparent from the fact that out of the 35 millions of acres granted to the Central Pacific, Union Pacific, and Kansas Pacific companies, only 165,000 acres had been sold in all up to the close of 1869, which would be at a rate requiring about 300 years for the disposal of the whole. The first few years of a railroad, however, scarcely afford an adequate test of its ability to draw population to itself and to dispose of its lands. It may, therefore, be useful to examine the experience of lines that have had a much longer existence, and of these an admirable illustration is furnished by the very line which initiated the system under discussion. In 1850, the Government of the United States granted to the Illinois Central Railroad a subsidy of 2,600,000 acres of the very choicest prairie lands in the United States, along a line of road traversing the entire breadth of a thriving, populous State, singled out by nature to be the most progressive State of the Northwest. By a system of elaborate advertising, of aiding immigration, of extremely liberal terms of sale, the Illinois Central has succeeded in selling in twenty years nearly two millions of acres of choice land in the heart of Illinois, and is to-day offering, by its widespread advertisements, the remaining 630,000 acres. In other words, the Illinois Central barely succeeded in selling 100,000 acres a year in the very heart of the most prosperous State of the Union. If we suppose that the present subsidized roads can equal these efforts made under the most favorable circumstances, and shall wholly escape the attacks of bankruptcy which periodically visited the Illinois Central during its career, we shall find that it would take about 1,870 additional years from now to sell the last of the Government land grants. It is useless to formulate a hypothetical result based upon the unquestionably far less favorable circumstances under which the present roads will have to operate. It is evident that the popular doubts as to the rapid settlement of the waste lands by means of these land grants are not altogether unfounded.

But if the sale of these lands, in spite of the efforts of the companies, is extremely slow, and promises to extend through centuries, and to be accompanied by serious and continued expense, the question naturally arises, Why are these colossal corporations incessantly clamoring for more? If, in the first place, there is such urgent need for these roads, why can they not be built without Government aid? And if there is no such urgent need for them, what induces so many men of wealth to spend year after year of time, and many thousands of dollars in money, in order to obtain these land grants, and build these roads that are not wanted? The truth is, that in modern railroad building the need of the road is the last consideration that enters the mind of the parties engaged in building it. The sole incentive to railroad building nowadays is the enormous profits made upon building contracts, which, by a strange perversion of moral sentiment, have come to be looked upon as legitimate and proper. Railroads are built exclusively for the profits made in building them, and these profits simply consist of the difference between the amount that the road really costs to build and the amount that the public can be persuaded it is worth and can be induced to invest in its securities. It is evident that the profit depends mainly upon the amount of securities the public can be induced to buy, and this again depends mainly upon the guarantees which the companies can offer for their payment. Now, so long as the public continues to entertain the prevailing opinion of the present and prospective value of the Government lands, so long will they continue to buy bonds secured by mortgages upon these lands, and just so long will huge companies try to get the lands to mortgage for the purpose.

The fact is, that the grants of public lands are sought for the sole purpose of raising money upon them by mortgage, to be employed in the building of roads for which there is no real demand, but from the building of which the grantees expect to derive enormous profits. How long the public will continue to have faith in the value of these lands, when they once begin to understand the extreme difficulty and delay attending their sale, is a question for private investors to consider. The question of interest to the general public is, how long they will permit the patrimony of the people of the United States to be used as a bait, by means of which the money of the country is withdrawn from beneficial industry, and invested in unprofitable enterprises from which corrupt individuals derive extravagant gains?

THE POLITICAL CRISIS IN ITALY.

Many people believe that the parliamentary régime, being an Anglo-Saxon specialty, can never in the long run agree with any foreign constitution. The frequent collapses of France, the permanence of obnoxious ministers in Prussia, the barrack platforms in Spain, and the incorrigible indifference shown by the Italians in the exercise of their civic rights, are quoted as proofs of this theory. Political writers should have, if nothing better, a stout heart, and should accustom themselves to witness political failures without at once despairing of human nature. Parliamentary rule means rule of majorities. Majorities can be stupid, silly, and even mad, just as minorities or individuals. Nobody ever pretended that their rule was good or wise; but it is the best and the wisest we can imagine, and we must, therefore, adhere to it with the same disregard for consequences with which we adhere to the moral principles that guide our actions in private life. The difficulty lies in the sifting of the chaff in the electoral law. But when a parliament has once been made adequately representative of all that is worth representing, the constitutional machine must be allowed to work for better or for worse. If the results are bad, the fault should be sought not in the machine, but in the people who work it, and should be corrected accordingly. All that is wanted, not only for a republic, but for all parliamentary life, is public spirit, and in this some nations are sadly deficient—none probably more so than the Italians. The question, then, arises: Can public spirit ever be acquired by special training or by experience, so that the applicability of the parliamentary régime becomes a mere matter of time?

The example of Prussia shows that this is possible, the innate individualism of the German character, which still remains unchecked in Southern Germany, having been considerably modified by the compulsory methods of Prussian bureaucracy. The application of these methods (the word method is too general a term to imply anything like undiscriminating imitation) would probably constitute the best preparatory training for all those people who, by natural disposition, seem least fit for the task of national co-operation and self-government. The Italians need not be too proud to learn such a lesson from Prussia. They have often learnt worse things from foreigners, and, whether they admit it or not, they have, notwithstanding the difference of race, far more in common with the Germans than with the French. To feel the hard hand of discipline and compulsion, and to get used to the idea that right and duty are not correlative, but altogether convertible, terms, would be a blessing to all Italians. They are the spoilt children of Fortune, and want nothing so much as a methodical infliction of artificial hardships. No nation ever saw its wishes and aspirations gratified so easily. Italy wanted union and independence, and she found fifty thousand Frenchmen ready to die for her. She wanted Venetia, and obtained it by two defeats. She wanted Rome, and her only obstacle, the French empire, vanishes into thin air. All this chapter of Italian history reads like a fairy tale. One knows beforehand that some good sprite will be at hand in the hour of need, and that, come what may, all will end well. Who would not rejoice over all this? The drawback is a purely educational one. It has nothing to do with these most welcome facts and events themselves, but with the dangers of the masterly inactivity of those who were chiefly interested in them. The political career of Italy is only now beginning. "L'Italia è fatta," said the King, in 1866; but he said this four years too soon. It is only now that Italy's struggle for existence can be considered as terminated, and that her independent existence as a political unit may be said to have begun in good earnest. A revision of the political machine at such a moment would not be inopportune.

But even before we have time to look at it, we hear of two incidents which, in these Titanic times, can attract but little notice, but which are, nevertheless, full of meaning. One is the withdrawal from public life of the two most conspicuous political leaders of Tuscany; the other is the vast number of abortive contests that have occurred during the recent elections, owing, in most cases, to the presence of an insufficient number of voters. The papers are wrong in calling this "abstention," since the term "abstention" implies intentional non-interference either from tactical motives or from indecision, while the "absenteeism" of Italian voters is generally due to sheer indifference and laziness. That the Romans showed great zeal on the occasion of their provincial *plébiscite* must be ascribed to the natural charm of novelty. When that wears off, the Italians feel inclined to leave the whole management of public (and, unfortunately, even of municipal) affairs to the professional politicians. They never tire of reading their favorite newspaper, and generally take side with either party. But that can be done in an arm-chair or in the café; and if the ballot-box were brought to him thither on election day, the Italian citizen would have no objection whatever to drop in his vote. In ordinary times one might get reconciled to such anomalies. But to see a quick-witted and spirited people like the Italians indulge in such *bodily* laziness (for it is nothing else) at one of the most solemn moments of their national existence, is a sad and ominous sight.

If, then, the Italian state, through the unwarrantable apathy of its citizens, is doomed to become an oligarchy, it would seem desirable, at least, that the oligarchs should be aristocrats in the widest sense of the word, and that the circle to which the rotation of legislative and executive power is restricted should be formed by those who are most conspicuous for experience, intelligence, and integrity. Ricasoli and Peruzzi have belonged to this circle ever since 1859. They have been its ornaments. Why should these men who have health and wealth and leisure to spare retire into private life just now? And why should they do so on the plea that, Rome having been annexed to Italy, they can find no further scope for their political activity? It would be far more proper to plead the reverse of this, and to say that, the catastrophic and cataclysmal period of Italian history being now over, the rulers of Italy stand no longer in need of Piedmontese generalship and Cavourian statecraft, but want precisely what they have not wanted hitherto, and what they have often harshly repudiated—the exquisite tact and delicate touch of Tuscan counsellors. It is said that Ricasoli was once snubbed by the King, who, being used to the rough-and-ready ways of his subalpine comrades, could not endure the cockneyfied stateliness of his Tuscan premier. It is also said that the complete separation of church and state was and is Ricasoli's political hobby; that his greatest failure was his Church Bill of 1864, and that the annexation of Rome, with a live Pope in it, has rendered his sacrilegious schemes even more impracticable than they were in 1864. The King, in fact, can hardly be expected to go to Rome with such a bill in his portfolio. Even his shilly-shallying with the Jesuit school of the Collegio Romano has failed to ingratiate him, and the gates of Rome may prove *to him* really gates of hell, although to the ordinary Italian mind the word "*scomunicato*" (excommunicated) conveys a ludicrous rather than an ecclesiastical meaning.

All this is plausible enough, and ordinary men might be excused for sulking a little, or even for despairing altogether, after such disappointments. But *noblesse oblige*, and a man like Ricasoli should rise above such considerations. He ought to know that, just now, Italy can ill afford to spare a man like him, even though till now she may have been better off without him. On this point, however, the "Iron Baron," as the Italians call the Puritan statesman, has shown himself quite unworthy of his splendid nickname.

On the whole, the Italians are not what is called "robust" politicians. They are far too sensitive and touchy for the rough work of party warfare. And those among them who were no longer young when the new era of constitutional liberty began in their country, have entered the parliamentary arena with such antiquated notions of propriety that honest debating must have been painful even to their adversaries. It is needless to say that these men of stately manners, who have grown up in the habit of considering courtesy the first of duties, never pass through a rough ordeal like that of an American or English election. To be cross-examined, abused, ridiculed, hooted, and pelted by a mob of voters would be considered by any Italian politician too high a price for the honors of a seat in Parliament. The Piedmontese were the first to be inured to the hardships of parliamentary campaigning, but have never got rid of their innate fastidiousness; and least of all would the Tuscans ever submit to the opprobrium of a political canvass, which they would fain banish altogether from the school of politics, as being foreign to its aims and prejudicial to its moral character. The consequence is that Italian canvassing, electioneering, and polling are now, and bid fair long to remain, most orderly, tame, and peaceful proceedings, involving no bodily risk and no mental anxiety to the interested parties beyond that of getting them up at all. Many candidates do not even address their electors, but publish their programme in the local paper, or write a discourse to be read by proxy, or remain altogether silent and passive, relying on their political reputation. And this last proves very often more successful than active canvassing.

American and English politicians may smile at this extraordinary tameness. But there is no harm in it. On the contrary, it will be seen that Italian candidatures, in being shrinking rather than competing, can hardly give scope to bribery or to intimidation; and in being based on a man's general reputation rather than on special issues or "planks," secure a greater independence to the deputy elect than he would enjoy where representation is as here a kind of special delegation. From a moral point of view, this is an important difference. The Italian deputy, being less fettered by promises, has no inducement to break or to evade any, and he can remain consistent—that is to say, loyal to himself without becoming disloyal to his constituents. Whether the system works better is a different question, which may have to be negatived when Italian platforms become more complicated, and the wishes and wants of the people more highly developed.

FRENCH HOPES AFTER FRENCH SUCCESSES.*

NEAR TOURS, Nov. 24, 1870.

COMMUNICATION is not easy now, and the news of to-day, if at all delayed, becomes as it were the news of a year old. The really great interest attaches to the great outlines, which do not deceive, but are ever going on, marking out the great historic and moral lesson. When I wrote to you last—towards the middle of last month—I told you what was then already beginning to be the aspect of the situation, and what has gone on confirming itself every day. I told your readers then that the virtue of the republican idea had already asserted itself, that the "standing army" policy was shattered for ever, and that it was now peoples and not cabinets or governments that would shape out the destinies of Europe, following in France's wake. This has proved more thoroughly true in the space of a few weeks than one could have ventured to suppose.

When I wrote, Metz had not yet fallen, and the identity of baseness existing between Louis Napoleon and *every one* of his military crew had not yet been completed. Vulgar-minded persons proclaimed their vague hopes of Bazaine's army, of the last and, as they said, "best soldiers of France." All that was overthrown at the end of October, and France may say "Thank God!" Bazaine's soldiers were amongst her worst instead of her best, and that for the reason that instead of being "France's" soldiers they were the hired butchers and bullies of the adventurer of the *coup d'état*, to whom France was simply a prey. A word I heard spoken in the streets of Tours but a few days ago serves to show what the feeling of Frenchmen themselves is upon the present attitude of the nation. As some of the young troops of the Army of the Loire were escorting into the town their German prisoners, a very well-known Englishman, who has lived in Touraine for ten years, uttered an emphatic expression of surprise, and ended by saying, "Well, I could never have believed if I had not seen it—and I don't understand it now!"

"I dare say not," remarked a middle-aged Frenchman at his elbow, with no very agreeable look, "for your country is still full of backward notions. But I will tell you who can understand it all better—your American cousins, as I believe you call them."

This speech I heard (and saw) made, and I assure you it conveyed to my mind a strong impression of truth. The present *national* rising of France is what I would fain style an American rather than a European fact. France resembles more and more what your own North was after Bull Run. She has set her back to the wall, and, with clinched teeth and iron will, is resolved to do, and ready to die. Every day brings in citizens who know how to obey, and learn quickly how to fight; but no trace is there of the swashbuckler or the lisping carpet-knight. *These* men are swept from the surface of the land, and are clustering round the adventurer, who, his game once played out, finds himself at his ease, and "comfortable" in the keeping of his "good brother" and sincere friend, King William of Prussia. It was from the hour when Metz was betrayed by Bazaine that the French nation struggled to its feet. It was, indeed, for France what Bull Run was for you—the sign that there must be no further trifling, but that the death-grapple must be carried out in grim earnest.

I have at this moment lying before me the letter of a young wounded Mobile, written to his father the day after the battle of Coulmiers. In it is this passage: "I had often asked myself what was the meaning of being brave, and I confess I was full of terror lest I should not be up to the mark. I prayed God and went forward. We did our best; and when I was taken up to be brought on here, I only know *we* were standing where the Prussians had stood a few hours before. I have been complimented by the colonel, yet, to say the truth, I hardly know for what. I felt all the time as though I were hammering away at that traitor Bazaine's head, and I seemed, in the din, only to hear on all sides, 'Vengeons Metz!' I am said to have behaved well, for which thank God! but war is a horrible thing, and the peoples ought to be spared from ever making it."

---

* This letter has been delayed, and some of its previsions are already falsified by events, but it is interesting as an expression of the feeling prevalent in the society in which the writer lives.—ED. NATION.

There are two sentiments expressed in the above letter (written by, I assure you, a very simple-minded young fellow, destined to be a civil engineer)—two sentiments which meet me now in France at every turn: one, a purely French sentiment of the passing hour; the other, a French sentiment for, I fondly hope, all time. The first is the sudden and strong rebound after the Metz treachery, and really does seem to mark a general and national and fierce protestation against the completion of the ruin which that infamous transaction was supposed to induce inevitably; the second is a moral conviction of the horror and unrighteousness of all war. This latter feeling seems to me to be spreading into a universal creed, and to arise from the very steam of the battle-fields and out of the very excesses of war itself. Every day the war endures I mark this feeling growing stronger, and (let me say it to the honor of Frenchmen) the more successful are the several actions on the part of the citizen-soldiers, the more openly it appears to me that they express their disgust and loathing for the fact of war. It is a thing of hourly occurrence now to hear young Frenchmen, lavish of their lives in their country's cause, say: "This must be the last war. It is not only monstrous, but absurd, that reasonable beings, educated, civilized men, should agree to destroy each other, and to devote the best efforts of their intelligence to discovering the best means of mangling the human frame." You may depend upon it, that whatever circumstance brings this war to a conclusion, there will be a clamor throughout France when it is concluded for a universal disarmament, and for an alteration in the public law of the world which shall substitute arbitration for the antiquated and savage appeal to arms.

Your readers will probably be anxious to hear on what grounds the French public in and out of Paris rests its now all but universal hopefulness. Upon three points: First, upon the fact that, since the fall of the Empire and the offer of an honorable peace to Prussia, France has unquestionably right upon her side; second, that every day that passes makes the nation more determined, and that, little by little, the entire population is rising up in arms—armed nations being forces against which no mere army could ever, in the long run, resist; third, that every day causes more discouragement to the Germans, for the plain and simple reason that, Germany having gained all that she ever wished or cared for, it is not only wrong but foolish to persist in wholesale carnage when there is, in reality, no object whatever to be gained. It is perfectly true that the instant Louis Napoleon had delivered himself over to the King of Prussia, and that his despotic empire lay crumbling away in the dust, there no longer existed any reason to justify the continuance of the war, nor any object that could be attained by continuing it.

The relative positions of the two belligerents were these: Germany had for centuries been striving for something which France mainly forbade her to achieve. This "something" was "German unity"—the right to be and to develop herself in a purely German sense. For this Germany really yearned, and no lapse of time stilled her longings. She regretted that the awards of kings and princes in 1815 did not give this unity to the Germans, and her leading statesmen said unto their death that a great mistake had been committed. In 1830, the youth of Germany turned hopefully to *la jeune France,* and actually expected her to help them to their so-craved-for unity. The youth of Germany never forgot that Orleanist France—adopting the narrowest of Bourbonist foreign-policy traditions—not only refused to stand by her own so-called "liberalism" *vis-à-vis* to other countries, but ignored with contempt the onward aspirations of other nations for the sake of selfishly obtaining tolerance for her new dynasty. To Louis Philippe remounts the modern hatred of Germany for France. It is since his reign that the more ardent spirits among liberal Germans have learnt to say, "No matter what she does, or what political form she takes, she will be of no use to any one else!" At the Revolution of '48, young Germany, side by side with France, made her great political movement. Austria and Prussia put her down. But still she went on, longing for her unity. Then, through fifteen years, there was a lull. Bismarck came, the Duchies were snatched from Denmark (made not German but Prussian), the war of '66 followed, and, with Germany half-made, the craving had become ravenous; but France, in the person of the Empire, opposed; and then came war—war for the one great reason that the unity thirsted for on the one side was refused upon the other.

At Sedan, Germany had attained her end—the end she really set out to gain. She was free to be, to call all her kings and princes into one narrow circle, acclaim them or depose them, and announce herself to the world as she listed—empire, republic, federation—anything she might happen to choose. Further than this Germany never spontaneously or naturally went. All the rest has been invented for her by Count Bismarck. Germany—nay, not even Prussia, had any longing for French provinces or populations; but not being able to bear the name of a republic, King William and his chancellor, to avoid peace with so hated a form of government, put forth conditions which they knew they would never, could never, obtain. They hoped to restore the Empire, and are only now beginning to see the fallacy of their hopes. But week after week is dispelling the illusion in the minds of the German troops, and the mass of landwehrmen, who are citizens and educated men, begin to listen to the inward protest of their consciences against this immoral, useless prolongation of the war.

Alsace and Lorraine will not be given up to Prussia, to constitute a perpetual menace against the French. Let alone external complications, France will pull through her present difficulties, and the nation will avenge the crimes of Cæsarism, and ask afterwards for "peace among all men."

Correspondence.

FRANCE AND GERMANY.

To the Editor of the Nation:

Sir: France and Germany will be discussed long after the armed struggle shall have ceased; what wonder, then, that they continue to form the topic of discussion now when the war is still going on, and when, in America, public sympathy, as it is called, seems suddenly to have taken a turn diverging toward France, probably because that country calls itself now a republic, possibly for other reasons. Grave things, however, ought to be discussed with earnest truthfulness, and not according to little sentimentalities, which are like mere ripples on a lake. The Premier of England says that Germany now plays the part which France performed at the beginning of the war. Why, cannot easily be seen; and there is, according to my opinion, no more substance in this utterance of the distinguished statesman than there was in his saying that Mr. Jefferson Davis had created a new nation. My friend, Senator Sumner, calls the tremendous war between these two great nations a duel. He cannot mean to stigmatize this contest, which is in history rather what great upheavings are in nature, as flippant, or an exposure of limb and life for mere cobweb honor; nor can we allow those to be in the right who ascribe the whole dire conflict to Count Bismarck—the cause of the war and the difficulty in making peace. It is especially Frenchmen, and some of the best and most liberal among them, who take this old-fashioned way of viewing things. They remind us of the former Catholic writers, who used to insist upon it that there would never have been such a thing as a Reformation had not a certain Augustine monk, called Martin Luther, fallen in love with a certain Cistercian nun, Catharine de Bora, and had they not, bent on marrying, rebelliously declared themselves against the Pope.

Of one thing the world ought to be convinced, that, no matter, right or wrong, it is Germany, united to a man, that pursues this war—Germany, closely united like a phalanx of old, which presses on for the possession of Alsace and Lorraine. Prussia, Bavaria; new provinces of Prussia, such as Hanover and Nassau, and old provinces like Pomerania; provinces that once belonged to France, like those in which are Treves, Cologne, and Saarbrück, and Rhenish Bavaria; Saxony, the old ally of Napoleon I.; and Hesse and Baden, the old members of the Confederation of the Rhine under the protectorate of the same Emperor—all, without exception, say we must now have them—not Bismarck, able as he is, he is not Germany; and if there be wrong in it, every German must take the blame, and is quite willing to do so.

But is there any wrong in insisting on the conquest, if it be preferred to call it so, of Alsace and Lorraine, or part of them? In replying to this question, I beg those who wish to arrive at a just conclusion—and I desire to have to do with none other—to divest themselves, as much as it may be in their power, of all the insinuation of figurative speech, or seduction of names and sounds of flickering sympathies, and the almost irresistible strength of mere association of ideas and feelings. Let us, for once, look truth straight in the face, however novel or unexpected some of her sharp features may appear.

The German argument is this: Ever since the fusion of the French people into a nation, France has considered the disunion and weakening of Germany as her greatest problem. Cardinal Mazarin instructed the French ministers at Münster to insist upon having the small princes of Germany declared *sovereign*, in order to weaken Austria and Germany in general, in the Peace of Westphalia, then preparing. Ever after France has preyed upon Germany. Lorraine and Alsace were torn from her by criminal violence and iniquitous adroitness, and Germany, under the most ruinous and incoherent government, disgracefully allowed France to keep the provinces and principalities wrested from her. Even in 1814, and again in 1815, France remained undisturbed as to them; but it was because Russia and England sided with France that Germany was then to be kept down by every one and to remain in her ragged state. France, however, was not satisfied even then. The absurd theory of a river, the Rhine, being the "natural frontier," was reasserted, and with grosser arrogance even than under Louis XIV. Still, Germany, having changed her government, kept quiet. At last, French conceit knew no bounds, and defiantly challenged Germany to meet her in battle. Germany did meet her; is victorious; lays bare the demoralized state of France, and, in order to protect herself, insists upon taking back Alsace and Lorraine or part of the latter, so that the preying and "natural frontier" theory and "strategic reasons" may have an end and Europe may enjoy peace. This is the whole argument, and neither jurist nor lawyer, statesman, soldier, philanthropist, nor religionist, can have aught to say against it, when an injured and patient party, challenged and worried by the wrong-doer into consent, subdues the wrong-doer and takes back the robbed property, however long he may have put up with his loss.

The French argument is, on the contrary, We cannot give up territory once declared to belong to France, for it would go against our honor. The Germans reply, The question is not about *honor*, but about *right* and our safety; nor can we see how honor, if that is to enter as an element of peace, is injured more by the loss of territory than by the loss of a whole series of battles, or by the infliction of a heavy war contribution, or the loss of a number of war-ships.

But say the French—and I do not give here my invention, but publicly and privately avowed and reiterated argument, repeated by high and low—Depend upon it that, if you take territory from us, this alone will be a cause for renewed war within a few years; and they say further, The loss of these precious provinces will extinguish France (*écraser la France* is the expression in the letters I have received), and if you do so you extinguish the civilization of Europe for long eras, for France has been the leader of civilization for centuries; or as others say, You will reduce France to a second-rate power, and—the reader will easily supply what French vanity here adds. We have heard it often enough.

The answer the Germans give to these objections is simple, and, I think, as strong as simple. What shall we do? they say. When we left you in profound peace, you attacked us to get to "the natural frontier;" and now, when we intend to take a portion of the rind of present France, you say that this alone will be a cause of war. What is to be done? We must have war in either case. As to the extinction of France by depriving her of a slice of territory, this argument does not harmonize with the preceding one. France will continue—at least, we must hope so—to contribute her share to the admirable Cis-Caucasian civilization—our united wealth. More she has never done, and more no nation of our great family ought to do. If France, like the other prominent nations, has been the leader in some branches—I cannot clearly see in which—she has also often been the leader of European demoralization. Let France, called upon at the time, as much as any other nation, to enter frankly the great path of the Reformation, but cruelly trampling out every germ of it by degradation, exile, or death—let France become modest. France, so she states officially, has some thirty-eight to forty millions of inhabitants; how can her diminution by a million or so reduce her to a second-rate power?

Mountains may be "natural frontiers;" rivers are only marked lines on the map. If the French are bent on a natural frontier, try the Vosges, and substitute the Moselle for the Rhine. Rivers played a great part in that unfortunate period of constant division of lands among the sons of rulers, not because natural frontiers, but because the best means of designation. The whole idea is merely vamped again in recent times. In the year 1844, I was walking with Alexis de Tocqueville in the garden of the Tuileries, when I asked him: "Is there any idea of France stretching to the Rhine left in the French?" He promptly and emphatically answered: "None whatever; there is but one enthusiastic idea, which extends all over France and to each Frenchman, that is, absolute political unity. That is the reason why the French dislike the United States so much. The French hate confederacies. As to the Rhine, no one thinks of it, be assured on that score." I repeat his words as literally as my memory permits, and I remember that De Tocqueville became slightly aroused when I did not accept his view of the non-existence of the Rhine fever as quickly as he thought I ought to do.

Let it be added that one of the French arguments is that the inhabitants of the departments in question do not wish the annexation; you are tyrants if you tear them from France against their will. This is a strange argument in the mouths of the French, especially concerning these very territories. I have spoken, however, at some length on the admissibility of a *plébiscite* in the case of Alsace and Lorraine; but I may add this significant fact, that the inhabitants of the Rhenish provinces of Prussia, who, in 1815, descended, as they thought, very reluctantly from the high position of being subjects of a great empire to the status of a mere Prussian, are now among the most patriotic Germans, needle-gun in hand, and that, as Wagener recently has shown by official census, the population and prosperity of these provinces have vastly increased within the last twenty years, while the population and wealth in Alsace and Lorraine have much decreased.

It is remarkable that not a man out of Germany raised his voice when the natural frontier theory was broached anew, or when Napoleon III. haughtily proclaimed, "When France is content, Europe is at peace," and now so many voices are heard against German love of conquest! The peace people and universal congressmen or women ought to be simply reminded of President Lincoln's remark concerning the difficulty of *swapping* horses in the middle of a stream.

The great war will bring good fruits; the moral equilibrium will be adjusted, and one nation will no longer presume upon the others. War is not the greatest evil, and all the fruits of peace are not free from poison.

I hate no one; surely not the French, among whom I have some of my most cherished friends. I have fought against the French, and, therefore, feel somewhat as a comrade towards them, as is customary among brave men; but personal feelings or fanciful sentimentalities do not settle the question which remains about right, truth, and independence, freedom from domineering, vanity of restless neighbors, and self-collected, undisturbed development of each great nationalized group, so that it may perform its assigned part in the commonwealth of nations and the progress of our civilization. Germany will be united, and must be so; and to be firmly united she must sufficiently strengthen herself against her neighbor, who has so long played the mischief-maker of Europe. Germany must fortify herself toward the west, and the western slope of the Vosges will be the glacis of this redoubt. *On this line it will be fought out.* This is no new idea. I am here, because from early youth I ardently adhered to it, and was sent into exile for my ardor for German unity and liberty.

FRANCIS LIEBER.

COLLEGE STATISTICS.

TO THE EDITOR OF THE NATION:

SIR: In your recent notice of a little pamphlet of mine, printed a year ago, on the statistics of collegiate education in this country, you observe that I have, *prima facie*, made out a case—namely, in establishing the fact that "the colleges are losing ground when brought into comparison with the increase of population," but that "this increase is mainly due to the immigration of foreigners, whose language or condition, or both, prevent them from sending their quota of recruits to our higher institutions of learning;" and inferentially, therefore, that my case, when looked into, is no case at all.

Since the pamphlet noticed by you was printed, I have prosecuted the statistical enquiry there commenced much more extensively, and have shown, I think, conclusively that the influx of foreign population into our States does not in any manner affect the truth of the conclusions I have drawn. The results of a very laborious investigation of this educational question in all its phases were embodied in a report presented by me to the Trustees of Columbia College, in June last, of which I had the honor, at the time, to forward to you a copy, and of which a second copy accompanies this communication. In respect to the foreign question, I beg leave to call your attention especially to the statements embraced in the pages from 45 to 48 inclusive.

I have the honor to be, sir, your obedient servant,

F. A. P. BARNARD.

COLUMBIA COLLEGE, N. Y., Dec. 10, 1870.

[We had overlooked these later statistics, which certainly prove that it is not immigration which has diminished the ratio of college students to the total population of all, or of any one, of the New England States. They point, too, to what is undoubtedly a principal reason why the American people have, since 1839, steadily lost interest in the support of the colleges—the enormous impulsion given, at that period, to material progress by the application of steam in locomotion and manufactures, the development of modern chemistry, and the other discoveries which have caused so marked a contrast between the last thirty years and the previous thirty. Not only, however, did these open new and countless avenues to wealth and distinction, but the immigration which they stimulated, by opening up our Western territory, immeasurably heightened the temptations to forsake learning for money-getting. In the decade which ended with 1839, this immigration increased by more than three hundred per cent., and as, on the one hand, it made it easy for the native American to get rich, so, if he belonged to the Democratic party, it made it easy for him to get office, without the expense of a college training. In this view, immigration still forms an important factor of the problem, though not as we were at first disposed to use it.—Ed. Nation.]

COMBINATION AGAINST RAILROAD CORPORATIONS.

To the Editor of the Nation:

Sir: The means of restraining our growing railroad monopolies has received some attention in your columns. I think it will be of little use to simply *pass* new laws unless, at the same time, some system of properly enforcing them is attempted. At present these corporations violate law because they know that very few persons can afford to apply to court for redress against a corporation. It is a very expensive experience in logic to prove that a corporation has violated law. I would suggest as one remedy the formation of local protective associations by the regular passengers and shippers over a certain railroad, excluding from membership those who are in any way interested in the government of the road. I do not think very high annual dues would be necessary to provide funds to carry up suits, as the mere fact of the existence of such an association would restrain them. Before Mr. Bergh formed the "S. P. C. A.," whoever interfered with a brutal man ran the risk of broken bones. Now the feeblest man can with a word restrain the stoutest carter, because he is known to have power behind him to enforce his commands.

It would be the business of the executive committee to pass on complaints from members, and, if the case warrant it, to enter suit. By confining redress to members, all would in a measure be compelled to join, thereby making light annual dues. When new laws were wanted, a conference by delegates from the local organizations would make the movement general.

I propose this movement not for the sake of prosecuting corporations simply because they are corporations whose officers, by judicious management, have made their investments pay, but that our laws when passed may be enforced. If the law itself is bad, have it repealed. S.

Philadelphia, Dec. 16, 1870.

Notes.

LITERARY.

A new work, entitled "The Genesis of Species," by Mr. St. George Mivart, is announced as nearly ready by Messrs. Macmillan & Co. While treating of the same subject as the works of Darwin and Wallace, it will be written from an entirely different point of view. The book will contain numerous illustrations.——A very unexpected announcement is that of the retirement from the firm of Fields, Osgood & Co. of the senior partner, Mr. James T. Fields. He will, it is said, still retain his connection with the *Atlantic*, and the style of the new firm will be James R. Osgood & Co.

—It may not be apparent at a glance why even the latitude of these "Notes" should embrace the late proceedings of a convention in this city to organize the American Association for the Cure of Inebriates. A proper reason will be found in the statistics of two of the asylums represented on that occasion. The Washingtonian Home, Chicago, has been seven years in operation, and has had 696 inmates, of whom only 173 were furnished by mechanical trades and callings, the remainder including 19 lawyers, 11 druggists, 10 physicians, 7 clergymen, 6 editors, 5 actors, 3 school-teachers, 1 judge, 1 publisher, and 1 professor of music. Supposing the latter to have their due proportion of the fifty per cent. who are reclaimed, it is obvious how much the intellect of the country is indebted to this beneficent institution. An asylum at Flatbush, which had 217 patients last year, and this year has had 547, shows a similar proportion of literary and professional men; and as this class is generally most able to bear the expense of treatment, we presume that all the other asylums, both State and private, are chiefly engaged in restoring to society those whom, on account of their education and capacity for public usefulness, it could least afford to lose. More complete statistics—and the convention insisted upon these—would go far to attract to inebriate asylums the attention and support which they richly deserve, and to cause their inmates to be looked upon as truly the victims of disease, which they are, and therefore entitled to the sympathy and encouragement of the community. Meantime, the definition of what constitutes an "inebriate," by an able and distinguished patient of the Binghamton Asylum, may be thoughtfully pondered by those whom it concerns:

> "There are persons whose original physical constitution and temperament are such that alcohol, once used, becomes to them a necessity; the brain and nerves, by virtue of some primary tendency, welcome the intruding force, and require the repeated stimulant, until at last they demand it with a vehemence which admits of no denial. The alcoholic habit is thus fixed, and the whole system must be nerved up each day by increased doses of poison, before either the mind or the body can perform its usual functions. Such persons are inebriates, and are none the less so because the use of alcohol may never be pushed by them so far as to produce complete intoxication."

—In many ways, the election of a School-Board in London on the last Tuesday in November was one of the most remarkable events of the day. First of all, the system established by it is a reform measure of so radical a nature that, even if it prove but partially successful, its effects can be little short of revolutionary—not only for London but for the entire kingdom—for it does what is only exceptionally done in this country, when, besides taxing the public for common schools, it compels parents to send their children to them. In the next place, the voting was a political experiment of great interest, inasmuch as it was by ballot, and cumulative, and was the widest application of household suffrage, including the votes of women. The ballot was so much of a novelty that some of the judges of election "lost their presence of mind," and the information of the police was insufficient to give directions where to go for and where to deposit the ballot, while "in many places the ballot-boxes were of an ugly and clumsy form, and it was difficult to get the papers in." But of the general character of the polling the *Daily News* says: "There was but one feeling all over London yesterday, and that was the conviction that in this election the ballot had prevented excitement, stopped intimidation, rendered bribery useless, thrown the shield of a most effectual protection over the voter, and proved the easiest, simplest, quietest method ever devised for taking the votes of a large population." The independence of the voters was shown in the fact that the candidates recommended by parochial committees or associations were quite extensively disregarded in favor of candidates who ran alone; and in the still more striking fact that of leading workingmen, or friends of the workingmen, almost none was returned by the class with which he was identified, and which was very numerous at the polls. And still the most remarkable feature of the election is the return of Miss Elizabeth Garrett by 47,858 votes, or an excess over her nearest competitor of at least 20,000, most of her supporters giving her their whole fifteen votes—"plumping," as it is called in England—thus securing her, by etiquette, the position of Chairman of the Board. Professor Huxley came second in rank, the Vicar of St. Pancras third, a Baptist clergyman fourth, Mr. Hepworth Dixon fifth, next a Roman Catholic, and finally a Presbyterian—this theological diversity showing how largely the question of religion, or certainly denominational feeling, determined the preferences of the voters. As Miss Garrett led Marylebone, so Miss Emily Davies, well-known as a writer on woman's work and duties, led Greenwich; and Mrs. William Grey came near being returned from Chelsea. The last thing worth noting is that for the first time the metropolis acted as a unit; and it should be a good omen that this unity was brought about in promoting education—the best bond society has yet devised for itself.

—An interesting writer in *Blackwood's* has recently been furnishing his fellow-Scots with some reading which, it may be presumed, will give them some considerable pleasure. Its perfervid patriotism, its characteristic pragmaticalness and Scotch conceit, and its crabbed self-assertion ought to make it well pleasing to Aberdeen and Edinburgh. Other people than Scotchmen will be amused by these qualities of it, and furthermore will like it for certain pieces of etymological learning which it contains. "Lost Preterites" was the heading of a former article, of which we said something at the time of its appearance; "Poetry and Humor of the Scottish Language" is the title of the essay now before us, which is the first of a series. "The Scottish *Language?*" it begins. "Yes, most decidedly a language! and no more a branch dialect or corruption of English than Dutch is of Danish;" and the writer goes on and makes out something like a case; or rather he would do so if all the rest of the world were not in a conspiracy against the Northern Athens, and did not decline to look at the Anglo-Saxon and Scoto-Saxon of five hundred years ago, and prefer to consider the living modern English as the Attic speech to which are to be referred all the modes of expression of all the various communities which do most of their speaking and writing in English. The English language, says he, so far as it remains Anglo-Saxon, is derived from the Low German, and with this it mixes the Scandinavian and the Icelandic; while the Scottish language, "so far as it remains Scoto-Saxon"—a most pregnant clause—is indebted more immediately to the Flemish, Dutch, and Danish. How far the Scotch of to-day "remains Scoto-Saxon" is a question which it would be a little dangerous to ask this essayist, if we may judge by the explosive character of his writing when he considers the case of those "snobs" and "superfine" people who have forsaken the ways of their fathers, and take a shameless pride in their affected South-British mode of expressing themselves. Time was, he says, when judges on the bench delivered their judgments in good broad Scotch; when advocates pleaded in the same homely and plastic tongue; when titled belles, celebrated for wit and beauty, made their brilliant repartees in their sweet native Doric; when ministers of the Gospel found their way to the hearts of their hearers by means of their honest vernacular speech. But all this is changed, and not only lawyers, clergymen, and titled ladies, but even many of the middle classes, can now be found who are proud of a "crass, besotted ignorance" of a language rich in song and romance, in humor, wit, and learning. For song, indeed, says our author, the Scottish is the only tongue. Hear a South Briton singing of "a pretty little girl," and then turn and listen to a Scot singing of his "bonnie wee lassie"! The Scot employs a language which, with its beautiful terminational diminutives and its copiousness of vowel sounds, is almost as deliciously soft and melodious as the Italian; while the Englishman is condemned to use a harsh, sibilant tongue. In fact, so deficient is the English in euphony that, if we except Durfey and Dibdin, no Englishman has ever made himself famous as a song-writer: and even such Scotchmen and Irishmen as have written songs in English—Campbell and Moore, for example—have produced poems, to be sure, but poems that are very poorly adapted to musical purposes. By the way, one is almost afraid to think of what would happen if some ill-advised persons were to point out to an assemblage of Scotchmen such as our essayist, the exact bearing which this admitted excellence of Scotch song-making would have in a discussion of the proposition "that the Scotch are incapable of pursuing the higher walks of poetry." By the time he had shown that there goes more to the making of the best poetry than naturalness and vividness of expression, or warmth of sentiment, or quickness of sympathy—particularly of sympathy with one's own feelings—or the slyness or breadth of humor—humor generally deficient in the half-affectionateness of humor in its best development, often suggesting coarseness of spiritual fibre, and not seldom bordering on moral coarseness—by the time the unbeliever had gone thus far, illustrating by examples, and long before he had begun the exposition of the office of imagination, thought, and passion in the production of the poetry best deserving of the name and most enduring, the lecturer would in all probability undergo such an assault from the prose incarnate that inhabits north of Tweed, as would effectually prevent his ever again attempting to talk of Shakespeare, or Sophocles, or Dante, to the people for whom "Robbie" brewed his peck o' maut or sang of auld lang syne.

— The principal elements of the Scotch, so far as Scotch is a tongue separate from English, our author finds to be four in number, namely—words derived from the German, which, though once possessed by the South Britons, are now obsolete in England; secondly, words and inflections derived from the Dutch, Flemish, and Norse; thirdly, words derived from the French; fourthly, words derived from the Gaelic, or Celtic, of the Scotch Highlands. Some of each of these classes of words we cite. The Gaelic words are mainly words naming features of the landscape, as *glen, burn, burnie, strath, bog, craig, cairn, corrie,* or *correi;* but there are numerous others which have nothing to do with local designation. *Cuddle* is one of these, from the Gaelic *cadail,* which means "sleep;" *whiskey* is another, from the Gaelic *uisge,* meaning "water;" others are *croon* (to hum a tune), from *cruin,* "to mourn, to lament;" *tinder,* from *teine,* "a fire;" *grove,* from *craobh* (pr. *craov*), "a tree;" *fallow,* "to lie uncultivated," from *falambh* (pr. *fallav*), "empty;" *clachan,* "a village," from *clach,* "a stone." It will be seen that in a good many instances the Scotch word is not in any particular sense Scotch, but is accepted and common English. *Croon, cuddle, bog, grove, tinder, fallow, whiskey,* belong to "Scotch," as distinct from English, just as *retribution,* or *candid,* or *difficult,* or *animosity,* or *fortune,* belong to Latin and not to English. Of words borrowed from France, with which country Scotland was long so closely connected, these following are a few: *Fash* (to trouble one's self), from *se fâcher; dour* (grim, obdurate, severe), from *dur; douce* (good-tempered, easy-going), from *doux; creel* (a basket), from *creille; awmrie* (a cupboard), from *armoire; bonnie* (good and beautiful), the diminutive of *bon; callant* (a spirited youth or lad), from *galant; braw,* from *brave; dool,* (sorrow), from *deuil; haggis,* from *hachis; caddie* (a young man acting as porter), from *cadet,* the younger born son, whence the slang word of opprobrium, *cad,* now current in England; *spaul,* from *épaul;* and many others, of which we may mention one as having a fixed place in classical English fiction: "Gardez l'eau"—Smollett, if we recollect, spells it *gardyloo*—was adopted as a necessary cry of warning in the days not so long gone, when the method of disposing of dirty water in Scotch cities was to empty it out at the window into the street below. Of words which he supposes to have been brought from the Netherlands into Scotland, and thence taken across the Tweed and incorporated into the language, our author makes a list, which is a good deal smaller than his list of words brought from France, but which is neverthelss a great deal too large. There is, for instance, small need of referring *blithe* to the Dutch *blyde* (contented), when we have the Anglo-Saxon *blithe* (gay, mirthful, cheerful); or of deriving the Scotch *lear* (learning), from the Dutch *leer,* instead of the Anglo-Saxon *lære;* or *ghost* from *geest,* when we have the Anglo-Saxon *gast;* or *breeks* from *breck,* when behind *breeks* is the Anglo-Saxon *brec,* and a Celtic word older by far than any literary form of either the Dutch or the variations of what is called the Teutonic tongue; or *stane* from *steen,* or *smack* from *smaak,* or *bane* from *been,* when Lowland Scotchmen have, in common with Englishmen and Americans, the Anglo-Saxon *stan, smœccan,* and *ban.*

—As to the German words in the Scotch of to-day, of course they are in very great measure those words of German origin which lie at the basis of all varieties of English, wheresoever spoken. Our essayist is chiefly concerned with such of them as, once common in English, are now obsolete everywhere except in Scotland. He specifies none, however, but contents himself with asserting that of two thousand words which Mr. Thomas Wright felt it necessary to include in the glossary to his "Vision" and "Creed" of Piers Ploughman, "many are still retained in the Scoto-Saxon of the Scotch Lowlands;" while in the glossary to Tyrwhitt's edition of "Chaucer" there are at least six thousand words which an Englishman would need to have explained to him, and only about three thousand which a Scotchman would not fully understand at first sight. At the end of his essay, having done with the contributions to the Scotch language which have been made by the French, the Dutch, and the Gaels, the author quotes from the writing of his poetical compatriots a series of words which seem to him admirable and worthy of general acceptation. But most of them which are particularly valuable have, we should say, already been naturalized in English, and accorded all the rights of citizenship. Thus, no English poet would hesitate to use, with Wordsworth, the Scottish *marrow* for "mate," "loved companion"—

> "Then said my winsome marrow,
> Whate'er betide, we'll turn aside,
> And see the braes o' Yarrow"—

or to use *malison,* as Lamb, for instance, uses it in his fine poem of the gypsy woman and the inhospitable door-step which she cursed; or to say *mirk* for "dark"; or *raid* for "foray"; or *slogan* for "war-cry"; or *sough* for the sighing sound of the wind; or *rouse* (*vide* Browning, "Dramatic Lyrics") for the drinking of healths; or *spate* (*vide* Browning again, "Childe Roland") for a stream in freshet; or the onomatopoetic *thud* (in constant use in this country); or *tryst* and *trysting* (*vide* Macaulay, "Lars Porsena;" Byron, "Parisina"); or *tyke* for "a rough dog"; or *weird* (at least as an adjective, though not perhaps as a noun); or *wraith* for an "apparition"; or *wimpling* for "flowing gently," "making gentle eddies"; or *wee* for "small"; or *eerie,* or *eyrie,* or *canny,* or *gloaming,* or *gruesome.* It is not Scotland alone in which these words are a part of the spoken or written language; nor was it by way of Scotland alone that they came into modern

English, though, of course, our debt is large to Scotland for her services in helping to preserve and helping to bring again into use words which were at one time driven out of our literature by that barbarous irruption into literary English by which the classical Romans more than repaid us for those irruptions into their empire which our barbarian ancestors used to make.

HOLIDAY BOOKS FOR THE YOUNG.—V.*

WHILE "Lilliput Levee" is still fresh, this Christmas brings a similar volume in "Posies for Children." It is made up of selections, quite largely, from "Lilliput Levee" itself, from William Blake, various periodicals, with stray pieces by Mary Howitt, Mrs. Follen, and others, besides several signed by initials, which, so far as we know, may be seeing the light now for the first time. It is certainly a long time, dating back from this book, since "Original Poems," by Miss Jane Taylor, were in fashion. There is one of hers only incorporated into this series, and it reminded us, by pure force of contrast with the pieces around it, of the old volume of straightforward little histories in verse which were offered to youth in the beginning of the century. Those were written for children; the "Posies" are largely *about* children, and, in spite of their simplicity and sweetness, are utterly uninteresting to the little folks themselves. Those were distinctly, not to say heavily, moral; the "Posies" do not moralize, they sentimentalize. It is safe to say that Miss Jane Taylor never "gushed;" the sense of her position as a teacher of children was too strong. There is no apparent perception of anything of the kind in the "Posies." Anything graceful, or fanciful, or comical, or anecdotal, or sentimental about children that has come into the author's head has been put down, and the collector has collected the mixture, and offered the whole to the bairns themselves, instead of half of it to their parents, which was the only mistake. The other half, however, the children will like; and the whole, it should be said, in spite of its great miscellaneousness, has been collected with always good feeling and generally good taste. We should omit the very inconclusive theology of "The Violet," and, in general, all sentimental religious pieces, unless of a very high order. "Nursery Nonsense" has furnished some good little things, of which here is a single specimen:

> "A little boy was dreaming,
>   Upon his mother's lap,
> That the pins fell out of all the stars,
>   And the stars fell into his cap.
>
> "So, when his dream was over,
>   What should that little boy do?
> Why, he went and looked inside his cap,
>   And found it wasn't true."

"Routledge's Album for Children" belongs to a species of book which we are not often inclined to praise—a book made up to sell. It is a thick, handsome volume of one hundred and ninety pictures, taken from all sorts of sources, with a page of text opposite each. Where it may be done, the real story belonging to the picture is told, as in the case of the cuts from Robinson Crusoe and Wordsworth's Lucy Gray; for other pictures, the imagination of the compiler furnishes the legend. These little histories, however, short as they are, are so suggestive as to be of real assistance to the mother perpetually pestered for stories by the little ones unable to read. With the half-dozen ideas they contain for a start, even a limited aptitude for invention may construct a much longer narrative. The animal pictures give occasion for some pleasant anecdotes and useful scraps of natural history.

Receipt-books are not always what fancy paints them, but we are mistaken if "The Happy Nursery" do not prove a valuable assistant to the "Mothers, Governesses, and Nurses" for whom it is intended. It opens with some suggestions on the comfortableness and healthfulness of the nursery, which are sensible, though not particularly new to people who have given any attention to such subjects. Its recommendation in regard to temperature, however, will hardly be adopted, although it ought to be reflected on seriously, by American parents. It cautions the parents against too low a temperature in the nursery on the mistaken ground of "hardening" the children; on the contrary, let them be kept warm—have the thermometer, "even in winter time," at about 60° or 62°. For the rest, the book is made up of directions for playing certain indoor games, and other directions, accompanied by cuts, for making toys of paper and cardboard. It concludes with a few short stories.

"Max and Maurice's" tricks are not of a sort that one would have a child of his imitate, and none is so good as the first, though some of the later situations are laughable and well depicted, and Mr. Brooks's version is quite in the spirit of the original. Mr. Busch's designs are of the well-known style of the comic *Bilderbogen*, and are ludicrous enough, though frequently coarse; but he needlessly distorts and vulgarizes the human countenance, and some of his exaggerations are positively repulsive—for instance, the organist who has been blown up by gunpowder.

It is a little difficult to characterize the eccentric composition entitled the "Merman and the Figure-head." It is certainly beyond the range of very young people, with its incomprehensible attempt at satire on Matthew Arnold and non-resistants, and other irrelevant topics; and yet the story, being neither allegory, nor genuine fairy story, nor anything but a kind of smart, haphazard sort of melange, is not at all equal to the demands of an older audience. The jokes and college slang about the "pious Æneas" are tolerably feeble, and the point of the whole very indistinct. But the story gives the impression of a writer capable of doing something better, with an audience kept well in eye, and a strong restraint put on a fancy that is overinclined to oddity.

The style, no less than the external execution, of "The Children's Crusade," shows it to be written for readers of a tender age, and designed to offer an amusingly instructive historical picture, and not a serious history. And as a kind of semi-historical children's book, it is very cleverly done, and will be found both pleasant and instructive, far above the average merit of the great mass of similar productions. Were it designed to be considered a real history, we should have to declare it abominable. For all that is fact in it and closely connected with the subject is hardly sufficient to fill up the tenth part of its pages, while the bulk of the interesting narrative is formed of either entirely suppositional or almost entirely extraneous matter—the merit of the author consisting in plausibly supposing facts and circumstances where his chronicles scarcely offer a hint, and in skilfully interspersing general historical notices and geographical descriptions —in all of which he evinces a considerable familiarity with the time and the countries he describes. The materials, mediæval or modern, from which he has drawn the slender basis for this historico-romantic elaboration, are ample enough to prove that it is not entirely spun out of a myth or a monkish invention, but they are but too vaguely referred to in the notes.

Every good child's Christmas presents this year ought certainly to include a copy of Mr. Knatchbull-Hugessen's "Puss-Cat Mew Stories," as it is one of the best juveniles of the season, and as such will be sure to give pleasure to readers of all ages. It is a long while since we have seen any fairy stories so entirely satisfactory as these, so full of a droll, homely imagination, so well in keeping with the real character of the supposed characters, and so imbued with a thoroughly pleasing morality while yet kept so free from moralizing. The book comes just in time to render again doubtful a conclusion which the perusal of many juveniles had begun to force painfully upon us, to the effect that the art of pleasing children without more or less seriously displeasing their elders was emphatically a lost art. Here and there allusions and incidents occur in the various stories which may need explanation to American children, to whom fox-hunting, for instance, is an unknown sport, and pollarded trees entirely unfamiliar objects, but otherwise there is nothing which the oldest and the youngest of its readers will not find equally entertaining. The stories were originally invented for the amusement of the author's children, and are written down just as they were told to that happy quartette of youthful critics whose entire approval must, one would suppose, have been carefully and successfully studied. The book contains something like twenty stories, long and short, which are accompanied by some pleasant illustrations. Which is the best of them we hardly know—whether that which gives its name to the collection, or the "Four Pigs," or "Kate's Adventures," though we are inclined to think that the choice lies between these three. Where all are so good, however, it is hardly worth while to make a distinction.

---

* "Posies for Children. A Book of Verse, selected by Mrs. Anna C. Lowell." Boston: Roberts Brothers. 1871.

"Routledge's Album for Children. By Mrs. Charles Heaton." With one hundred and ninety illustrations. New York: Geo. Routledge & Sons. 1871.

"The Happy Nursery. A Book for Mothers, Governesses, and Nurses, containing Games, Amusements, and Employments for Boys and Girls. By Ellis A. Davidson." With numerous illustrations. New York: Cassell, Petter & Galpin.

"Max and Maurice. A Juvenile History in Seven Tricks. By William Busch. From the German by Charles T. Brooks." Boston: Roberts Brothers. 1871.

"The Merman and the Figure-head. A Christmas Story. By Clara F. Guernsey." With illustrations. Philadelphia: J. B. Lippincott & Co. 1871.

"The Children's Crusade: An Episode of the Thirteenth Century. By George Zabriskie Gray." New York: Hurd & Houghton. 1870.

"My Schoolboy Friends." By Ascott R. Hope, Author of "A Book about Boys." New-York: Virtue & Yorston.

"Puss-Cat Mew, and other Stories for My Children. By E. H. Knatchbull-Hugessen, M.P." New York: Harper & Brothers. 1871.

"The Magnet Stories. John Jack. By Lynde Palmer. Author of 'Drifting and Steering,'" etc. Troy: H. B. Nims & Co. 1870.

"Work for All, and Other Tales. By C. E. B , Author of 'Amy's Watchword.'" Fifth edition. New York: E. P. Dutton & Co. 1871.

"Under the Holly; or, A Week at Hopeton House. A book for girls. By 'A Pair of Hands.'" Philadelphia: Porter & Coates. 1870.

"Enchanting and Enchanted. From the German of Hackländer. Translated by Mrs. A. L. Wister." Philadephia: J. B. Lippincott & Co. 1871.

"My Apingi Kingdom: With Life in the Great Sahara, and Sketches of the Chase of the Ostrich, Hyena," etc. By Paul Du Chaillu, author of "Stories of the Gorilla Country," etc. Numerous engravings. New York: Harper & Brothers. 1871.

Another book which fairly deserves the praise of being very well adapted to please the class of readers for whom it was intended is Mr. Ascott R. Hope's "My Schoolboy Friends." Mr. Hope is a schoolmaster who seems to have been fitted for his work by nature, and who, by reason of the essential boyishness of his own character, as displayed in everything that he writes, by his inoffensively evident conceit, his fondness for inexpensive wit, and his way of lugging in his sentiment by the ears whenever he thinks it well to show any, ought to be found a readable author by all good-natured people. That his story is quite so good as perhaps it ought to be when we remember the freedom with which, in his "Book about Boys," he criticised other people who presumed to write for or about his favorites, or that that "lay dabbler in boys," the late Mr. Thackeray, has not on the whole, surpassed him on his own grounds, we are hardly prepared to admit. It should be taken into consideration, however, that Mr. Hope disclaims all wish to please other critics than the boys themselves, and their verdict will undoubtedly be in his favor. The book is interesting, too, as showing how a schoolmaster thinks boys should be amused, and how little preaching he thinks it well to administer to them; and to be praised for the way in which grown-up sentiment, unnatural incidents, and exaggeratedly good or bad characters are avoided.

Still another clever and instructive story, which, however, although ranked among juveniles, is, on the whole, rather better adapted to the class known as "young people" than to children, is the fourth of the "Magnet Stories," by Lynde Palmer. This is an American story, and inculcates in a sprightly way, but with plenty of earnestness, the necessity of a steady fight against one's lower impulses, and of a constant watch upon that unruly member, the tongue. The lesson is a sound one, which can hardly be too often repeated; and this book, which teaches it pleasantly and without overmuch preaching, will be found agreeable reading.

"Work for All" is addressed to readers of about the same age as are the "Magnet Stories," but for various reasons is neither so good nor so interesting. It is an English book, written for the benefit of girls of the poorer classes, and, like most books that we remember which fall under that general description, it has a rather irritatingly condescending tone about it, and shows that sort of ready acquiescence in the providential disposition of things which has provided the poor with natural and infallible instructors in their richer neighbors, which is all the more amusing when it is in such perfect good faith as that possessed by the writer of these stories. "To be content in that station of life to which it has pleased God to call them," seems in books like this to be that clause of the catechism most necessary to be impressed on those below us; but, contentment having been found, it is not amiss to show our pupils how easy it is for them to find some good work to do also, and how naturally happiness is found in the path of duty. Which is all very true and very useful, doubtless, but has never, since the days when Hannah More was pursuing the like praiseworthy tasks, been found over-entertaining.

"Under the Holly" is a collection of Christmas stories, supposed to have been read in the holiday season, by "Mrs. Hopeton, of Orange, New Jersey," to a group of children. One or two of them are quite good enough to be interesting, and no doubt the entire book will be found readable by girls of twelve or fourteen, with whom its tendency to be sweetly sentimental will not be likely to hurt it. Against its occasional verses, however, we wish to warn all readers.

Good as were Mrs. Wister's translations from Marlitt, we are not sorry she has turned from that too self-repeating author to give us these charming tales from the German of Hackländer—"Enchanting and Enchanted." The author's delicate imagination raises them above the common run of fairy tales into almost poetical regions. Children will enjoy them, of course, on account of their wonderful plots; but older folk may almost revive their childish pleasure in histories of magic, through the author's skill in managing the old machinery of dwarfs and kobolds, enchanted castles, and princesses of peerless beauty. "The Elfin Tree," the first of the series, reminds one of Andersen in its subject, and somewhat, also, in its realism and sympathy with children's feelings. "The Dwarf's Nest" and "Castle Silence" are more interesting, however, with the weaver getting his designs from the wonderful slips of cloth left in his loom by the dwarfs, whom he hears whirring at it at night when the moon is full; and with the silent valley, in which every one who enters it becomes dumb. Hackländer attempts an Arabian story, which in point of ingenuity is worthy of its models, but is so oddly Germanized in point of style and treatment as to be quite destructive of the sentimental interest one feels in the stories where he is native and to the manner born. His description of the fearful beauty of the Princess Morgana is forced and feeble; nothing like the gorgeous descriptions of the damsels of the Arabian Nights. As inferior here is Hackländer as he is superior in purity and depth of sentiment—for instance, in the picture of the young man riding after the mirage, alone, across the desert, and seeing the spirit-caravan pass him.

Mr. Du Chaillu, this year, conducts his young friends to his kingdom in Equatorial Africa, and tells them remarkable tales about his admiring subjects, the Apingis, who composed and sang short poems in his honor, who invoked him as a "Great Spirit," and who were plunged in profound grief when, having worn out his shoes and exhausted his supply of beads, he found it the part of wisdom to abdicate his throne, and return to New York and to juvenile book-making. There are no gorillas in this volume, nor anything much more exciting than ostriches and white ants, and some of his admiring friends in these more temperate climes are, we fear, going to be a little disappointed. The tales he does tell are, to be sure, quite as remarkable as any he has told heretofore, and quite as easy to be believed, but we suppose it is hardly in the nature of things that boys and girls should be very deeply interested in hearing about the great awe and respect which our traveller inspired among his simple savages, of the numbers of wives pressed upon his unwilling acceptance, or of the ecstasies of excitement into which the present of a "long lock of his black hair" threw a whole village. However, there is a leopard in the book, if there are no gorillas—and our author wounds, if he does not kill, a bull elephant, and we learn that out of the numerous hippopotami which met their death at his hands, he has presented the skin of one to his "distinguished friend Bierstadt, with whose magnificent paintings" his young friends are doubtless familiar. Such little realistic touches as this are always pleasant. Mr. Du Chaillu goes also to the desert of Sahara, where he pursues the timid ostrich, and makes omelettes of its eggs. Here also love and admiration attend his wandering steps—and certainly, if he is as amusing when he travels as he is when he recounts his travels, nobody is going to wonder at his exciting some strong feeling or other wherever he goes. Reverence and awe are, perhaps, not the precise emotions we should expect him to awaken—but then we cannot all be civilized and critical.

The Student's Mythology: A Compendium of Greek, Roman, Egyptian, Assyrian, Persian, Hindoo, Chinese, Thibetan, Scandinavian, Celtic, Aztec, and Peruvian Mythologies, in accordance with standard authorities. Arranged for the use of Schools and Academies. By C. A. White. (New York: W. J. Widdleton. 1870.)—From the "Prefatory Note," which is much less pretentious than the title, it appears that this new text-book was designed chiefly "for pupils who have not yet entered, or who . . . are not likely ever to enter, upon any regular classical course." It claims for itself no superiority in point of erudition over other mythological text-books, and has confessedly "avoided questions of comparative mythology, except in cases where the analogies are too obvious to be passed unnoticed." What the author aimed at was to present the classic fables in a simple and poetic form, free from impure traits, and to enlarge this ordinary sphere of mythological instruction by brief notices of Eastern, Northern, American, and other religious myths. And this modest task he has executed in a way which ought to secure his "Compendium" admission to a large number of our schools. The style of the book is very pleasant throughout, and the selection of matter, as well as its arrangement, satisfactory. Some of the statements and explanations, however, savor of rather antiquated notions. Thus, we hear that the origin of the false gods is owing to a general corruption of mankind, "when . . . they lost the knowledge of the true God, and easily fell into idolatry;" that "it is probable that there was a wise and good king" of the name of Jupiter, "who really reigned in Greece;" that Bacchus "was probably some prince who taught the people to till the ground, and cultivate the vine;" and that "it is believed that Æolus was a skilful astronomer who dwelt in a volcanic island." Some of the supplementary chapters are exceedingly meagre; that on "Egyptian divinities," for instance, contains only brief old-fashioned notices of Osiris, Apis, Serapis, Isis, Anubis, and Harpocrates, and the one inscribed "Deities of the Assyrians" nothing besides equally poor statements concerning Baal, or Bel, Moloch, Thammuz, and Oannes. The accent is often incorrect; we find Pac'tolus, Alcitho'e, Ocean'us, Diom'edes, Bu'bastis

Orphe'us, and similar inaccuracies. We also notice Cœlum for Cœlus, *Phæton* for Phaethon. and Cytherea for Cythera.

H. Kiepert's Wall Map of the Ancient World. In six sheets. Scale 1 : 5,400,000. (Berlin : Dietrich Reimer. New York : L. W. Schmidt. 1870.) —The full and real title of this map—only the cover title of which is in modern language—is: "Orbis Terrarum Antiqui Tabula Geographica ad illustrandam potissimum Antiquissimi Ævi usque ad Alexandrum M. Historiam in usum scholarum descripta ab Henrico Kiepert." Its contents are thus limited to periods in ancient history previous to the expansion of the Roman power beyond the limits of the Italian peninsula, and this explains the absence of many important names belonging to the wider domain of ancient geography, such as Galatia or Sarmatia—which will be found, of course, in the author's "Wall Map of the Roman Empire." On the merits, both literary and technical, of the map before us, it is needless to expatiate: the name Kiepert is a guaranty for general excellence in this branch. It is, however, particularly remarkable for clearness and distinctness. And not only are all kinds of territorial divisions well marked in fine colors, but the Aryan or non-Aryan descent of the nations in India, the Phœnician or Greek origin of cities, and dependence upon the Persian Empire are similarly pointed out. The author, in a note, makes himself responsible for the revision, and for corrections "in accordance with the requirements of the present day." Comparing this map with the last edition of his "Atlas Antiquus" (Ten Maps of the Ancient World for Schools and Colleges)—which, by the way, we cannot refrain from warmly recommending to our institutions of learning—we find a number of alterations in names, the reason for which lies in the above-mentioned chronological limitation of the compass of the work. Thus we find Saus and Draus for Savus and Dravus, the Latin names of the rivers Save and Drave (in Greek, Σαῦος and Δραῦος), and Letuspolis, Hermupolis, Apollonospolis, and Lyconpolis, for Latopolis, Hermopolis, Apollinopolis, and Lycopolis. The form Lyconpolis, in one word, however, seems to us contrary to the spirit of the Greek language; nor do we know why the names Heliopolis and Heracleopolis have not received the corresponding alteration into Heliupolis and Heracleupolis.

**** Publishers will confer a favor by always marking the price of their books upon the wrapper.*

THE WINTER GALLERIES.

Among all the dealers' collections open for the winter season, the gallery at Goupil's maintains its relative importance in foreign pictures, for which indeed Mr. Knoedler has special advantages. They form the solid and valuable side of his collection, contrasting curiously with the American pictures usually exhibited with them, which have nothing but a commercial existence, and should appeal to a class of customers very different from the more cultivated appreciators of foreign refinement. The specialty cultivated at Goupil's is of the French or rather of the Parisian school—for one can be Parisian, and very Parisian, without being French—and many foreigners achieve this nice distinction with an ease quite unattainable to the heavier native character. Thus, it is not at all surprising that Mr. Zamacoïs, a Spaniard, should be the extreme representative of French skill in this collection. The wonderful plausibility of the French stage, and its illusive truth to nature, are revived in the admired picture called "The Education of a Prince," for which no artist devoted to the amusing of the public could have invented a more ingenious libretto. The scene is laid in Spain of the last century, in a royal hall of the *rococo* style of the period, which, by the way, is most admirably understood and rendered. The little prince, perhaps two years old, is busy rolling oranges for cannon-balls, at an army of wooden soldiers. Near him stands his nurse, in the motionless position of a servant on duty, among other indifferent servants, guards, and lackeys. But the child remains a source of wonder for the courtiers; the oldest and stiffest bends to pick up the toys knocked down, and the younger men of the world murmur their respectful admiration. Even a red cardinal of the church smiles, proud of a future illustrious pupil. Mr. Zamacoïs has distributed all his parts with wonderful intelligence, and the little actors of his opéra bouffe carry out their characters of indifference or interest with great earnestness and precision. Perhaps even the faces of his figures are too rigidly set in their meaning, which objection is increased by a certain heaviness of painting in them, very different from the light, gay treatment of the accessories.

Especially does the flesh painting of Mr. Zamacoïs appear heavy and monotonous, and his drawing meagre, when he is compared with his colleague in art, Mr. Vibert, whose little picture of some model, reclining on a red sofa, and fingering the leaves of a big book, is certainly the best painting of these schools that we have had in New York. It is most accurate in modelling, and almost illusive in that way. Far from the continual brilliancy of Mr. Zamacoïs, here each different material has its particular and different quality of dulness or shine. The stuff of a red sofa, of a carpet and tapestried wall, the hard and mysterious surface of a mirror, the fur of a big lion's skin, are rendered fully, easily, and in accurate relations of place. So charmingly successful is it all, that we regret our suspicion that the painter has exaggerated a width of hips in his model beyond the most ample feminine structure. The figure, however, is ever so much more living than is usual with these painters of extreme finish and correctness, who incline rather to the manner of their master Gérôme than to that of their master Meissonnier. When we can look at them in peace, Meissonnier's figures are interesting in themselves, abstracted from their clothing and habits of life. With most of the other painters of drama, they exist only for the part they have to play. In Mr. Zamacoïs' picture, for instance, the group of courtiers, noblemen, clergymen, and warriors are too well suited to their momentary occupation of picking up balls for a baby. That essential contrast is wanting by which in real life we should have thought them degraded. They are all, to speak forcibly but in sober truth, most elaborate and intelligent sketches, or rather studies never to be realized. The painter does not believe enough in them for that; what he does give us is given with the shrewd glance of a mind protected by irony from too much sympathy with nature. Again, in Alfred Stevens' picture of a woman with a parasol, the lady is more important than the woman; but the painting is exquisitely simple and masterly as far as it goes, in that light gray tone which is one of the new ambitions of painters.

The man who shall show respect for the glorious presence of the human form, or feeling for its vitality, is certainly not Mr. Bouguereau, notwithstanding that he desires to repeat and perhaps because he does recall the memories of great work and historic art. Certainly his careful and experienced practice of to-day, the nice modelling of his earlier paintings, his evident knowledge of better things, do not prevent the figures here exhibited from having, with all their merits, also much of the look of the best realistic work on Sèvres porcelain. That big picture of his now occupying the space formerly taken up by Mr. Heade's landscape, would be fashionable if put upon a plate, for which end the brittle and glassy look of every part, even of the flames of the candles and the lips of the young women, makes it eminently fit. It is a picture of which Mr. Koekkoek might well be jealous. Even the illustrious Rosa Bonheur's animals (a flock by the sea-side) have unfortunately somewhat of the same exquisitely polished surface, as has the air in which they breathe, while the grass upon which they live is of too soft and mossy a nature. Her great merits remain unaltered, but her defects seem to have increased with her great experience.

In the seated figure of a woman writing, by Mr. Bischof (of the Hague), the main point of the picture, which is the woman, is sacrificed to the Japanese vase alongside. This, however, is deliciously painted, and the whole picture has the pictorial aspect characteristic of the national liking for painting. In the big picture by Knauss, of "Mowing on the Mountain," we miss the dramatic interest he has taught us to look for in his works. There is a small Alfred Stevens, pleasant and intimate, a pretty De Jonghe, wherein a child's mamma allows it to bite a cherry from her lips, all the while with an expression of countenance not strictly maternal, and a Boughton, full of that graceful melancholy he has of late years assumed.

After all this wit and intelligence it is pleasant, in Mr. Avery's gallery, to rest in the peaceful presence of work by Allston. Of him there is a lovely portrait, traditionally his own in early youth, signed and dated Rome, 1805, the first year of his residence there. It is painted most probably from some earlier study, for the face is very much too young to have been that of Allston at twenty-five. This youthfulness is set off by the formal and slightly absurd costume of that time, which here recalls that refinement of feminine dress by which the contradiction of the cut suggests a graceful body. A soft white collar turned over an orange neckcloth, a sea-green waistcoat, over which is buttoned a high-necked black coat, and a gray background of wall, make so many values of color, which unite in a sober harmony and modestly frame the face. A certain limpidity of soul, as if of youth prolonged, is the impression of character one receives; a sensation helped by the faint grays and pinks of a child-like complexion, though we shall not say that no cleaning has paled the picture. There is a slight weakness of drawing in places, but it seems natural enough in youthful talent, and the general delicacy is increased by the vigor and fulness of the notes of color, black, white, and gray, which are exquisite in relation. It is to be hoped that the picture will remain in New York. We have but little here of the very unequal Allston. Boston is the only place rich in works of his, nor will they likely leave it. It might be well to have some fuller representation of a man who is to be a principal ancestor in our future art-history, and for whom alone, up to to-day, among American artists, we can claim something of a higher rank than talent.

That realizing of an age unconscious of other experiences of life which makes the charm of Allston's portrait, should appear somewhere in the new picture by Mr. Boughton. The mutual "Indifference" of youth and age is the subject of the painting, which has for epigraph these lines by Mr. Aldrich:

> "When my hair is gray,
> Then I shall be wise;
> Then, thank heaven, I shall not care
> For bronze brown eyes."

The bad luck attending the use of poetical titles and subjects has fallen, we fear, upon this painting, which seeks to realize outwardly an inward impassibility to an unexpressed sentiment. That limit within which the comedies of Mr. Zamacoïs and others are able to remain has been overstepped by Mr. Boughton, and we cannot see that his meaning has been given, as he must have wished, in the action of his picture. The two young ladies in the picture who have passed by an elderly and abstracted gentleman are not radiant with a feminine influence no younger man could escape, nor can anything in their "promenade" motion explain that were the old man young the women would not pass on. And what is to assure us that the old gentleman, whose back is turned, is not the owner of a susceptible heart? Nor does the large proportion of landscape, which is carelessly painted and not in intention good enough for Mr. Boughton, help in any way the meaning of the figures. For accenting this, any little caricature, such as those in *Punch,* would have been better suited, as the discarding of reality in color, and the underlining of intention by drawing, might then give the story its necessary evidence. But Mr. Boughton has also here an unpretentious little piece, painted when he was with us—a winter scene under a cold veiled light, which does not need any lines of poetry appended to be understood.

Gérôme has an ethnographic study of an Eastern head, painted with his usual slippery touch, as if he modelled in clay, but intelligent as usual. Of Zamacoïs there is a remarkable water-color, in which his defects become almost advantages, so pleasant is it to follow out the sharpness of his touch; of Leroux, an academic and pseudo-antique composition; of the dead Paul Delaroche, a sketch of the temptation of Christ, which, in painting, is rather like some of the sketches of Mr. Vedder—not his best; several pleasant French and Belgian little pictures, and a Corot, of no great excellence, but which makes all the other pictures look leaden or oily by contrast.

Our own artists also are somewhat represented at Mr. Avery's. Mr. Henry has here two little pictures of American interior architecture of the last century, with figures to match. With an evident sympathy for the furniture of the period, the artist seems unable to get the better of a certain meanness or poverty of sentiment and execution in his copying of the same. Surfaces of metal, of wood, or of porcelain, have no separate charm to his eye, and the very small size of the paintings is not in harmony with their awkward and inaccurate touch. Still, there is quite a record of lights, reflections, and shadows, and the things have their interest doubtless. Whatever may be the distance between their merits and those of Mr. W. T. Richards's work, in his careful and admirable studies of waves and their curves and modelling against the vast horizon of the open sea, something belittles pictures which in their motive ought to give the fullest impressions of size and space. With one at Goupil's quite similar in subject and in treatment, there are at Mr. Avery's several studies from the New Jersey coast of remarkable choice of scene; but in all of these the difficulties of drawing and perspective, in light and in color, seem to be the causes of a miniature impression. There are also some pleasant natural little pictures by Mr. Whittredge, some things by Mr. J. G. Brown, and another Allston, small, not very interesting, painted during the bad days of his bondage in England, but modest and solemn amid the more noisy and more modern pictures.

The few new points at Mr. Schaus's are a Willems, "The Judgment of Paris," a parody in costume of the seventeenth century, with the artist's usual finish and pleasant arrangement of colors, with the usual signature of a satin dress, and unfortunately, too, with the usual gray wall which here does duty for a sky. Also, a large Koekkoek, said by connoisseurs to be fine, but of no other artistic merit. Worth looking at are a demi-monde seated figure, by Toulmouche; a cat, by Henriette Ronners; a soft blue water-color, by Rico; and most especially, another admirable water-color drawing by Zamacoïs, with the usual points of excellence above noted, each touch conveying a lesson in accuracy and decision.

At Snedecor's, amid a wilderness of chromo-lithographs, there are several noticeable pictures by foreign painters. One is by Tissot, and represents an abduction, with much attention to archæology, much observation of nature and probability, and careful choice of scene, but the whole so painted as to enforce the fact that the affair took place in the sixteenth century. There are, besides, one of Diaz's failures, and a pretty picture by Mr. Lévy, one of the younger French celebrities, wherein a classical youth holds fast a little maid while she gazes down from a height of rock with a dizziness nicely indicated by the painter. Though he is evidently skilled in figure drawing and more so than in landscape, the landscape is still the better part of the picture, if we accept the painter's manner. That manner is held to excuse the usual recipe by which the heads of the figures are made to look dark against the sky, not by opposing them to a greater source of light, but by rubbing dark over them. Among a good many other little foreign pictures, and some with merit, one is noteworthy for its character. It is by Mr. Escosura, a Franco-Spaniard of the high-finish school, but has with much finish and littleness therein an appearance of serious naïveté. There are here no American paintings of note, unless we except Mr. Colman's "Regatta," and some pictures and chromo-lithographs by Mr. J. G. Brown, who may represent one end of the scale of comic painters.

A set of etchings, remarkably successful, now at Goupil's, should have been mentioned as the only representatives of Mr. Fortuny's talent which was a late sensation in European art.

The humility and subjection which are the portion of applied art, freeing it from so much of the strain and pretence which disturb independent effort, make it all the more an interesting test of depth of artistic feeling. We were thinking that, with the renewed appearance of Allston, certainly the freshest thing and most hopeful promise was some needle-work, designed and embroidered by a lady, which is also on exhibition at Mr. Avery's. Some specimens are also to be seen at Tiffany's. It is pleasant to recognize that the usual ways of woman's work have given us here something quite equal to what comes to us from far-off art. Indeed, we have not had from abroad any modern decoration more remarkable for the ingenious novelty of a design borrowed directly from nature; a simplicity of decision, which we usually call manliness, but which in art is not uncharacteristic of woman's work; knowledge of form, and accuracy of drawing, and a free and delicate sense of color. And little more could be said in praise of more ambitious work. Indeed, it might be questioned whether any better design has been made in America, whether any painter or draughtsman among us, to-day, could give us as noble and accurate a rendering of the forms and growth of plant life. For these embroideries represent such natural elements of decorations—there are, for instance, among others, apple-tree branches in blossom, trailing grape-leaves, vines seen through illusive spider-webs, the Virginia-creeper in sunlight and shadow, and branches of the pine-tree, chestnut, and frost-bitten sumach. The stuffs upon which these subjects are embroidered seem to be chosen usually for their color's resembling some great natural background, such as the sky, blue or overcast, the brown earth covered with dead leaves, or grass yellowed by the sun. The remarkable beauty of her work has been so fully recognized by others that we need be under no reserve in mentioning the name of the artist embroiderer—Miss F. B. Dixwell, of Cambridge.

JUST PUBLISHED BY

PORTER & COATES,

822 Chestnut St., Philadelphia.

LONGFELLOW'S POETS AND POETRY OF EUROPE.

A New and Revised Edition, just completed, by H. W. Longfellow, with the addition of 150 pages of entirely new matter never before published, making it one of the most elegant and complete works extant. With Introduction, Biographical Notices, and Translations, from the earliest period to the present time. By Prof. Henry Wadsworth Longfellow. Illustrated with engravings on steel and engraved title. Imp. 8vo, cloth, extra gilt top, bevelled boards, $6; sheep, marble edges, library style, $7 50; half-calf, gilt, $9; Turkey morocco, $12.

"This valuable work contains selections from about four hundred authors, translated from ten languages. Mr. Longfellow himself gives us translations from all these languages but two."—Allibone's Dict. of Authors.

"This edition has been revised and enlarged by the author, and contains his last touches and additions to his labors."—The Age, Philadelphia, Nov. 3, 1870.

HEDGE'S PROSE WRITERS OF GERMANY.

A new and revised edition. With Introduction, Biographical Notices, and Translations. By FREDERIC H. HEDGE, D.D. With Six Portraits on Steel and Engraved Title. Imperial 8vo, cloth extra, gilt top, bevelled boards, $5; sheep, marbled edges, library style, $6; half-calf, gilt, $7 50; Turkey morocco, $10.

"There is no book accessible to the English or American reader which can furnish so comprehensive and symmetrical a view of German literature to the uninitiated; and those already conversant with some of the German classics will find here valuable and edifying extracts from works to which very few in this country can gain access."—Prof. A. P. Peabody, in North American Review.

A New Globe Edition of

THE WAVERLEY NOVELS.

By Sir Walter Scott. In 16mo size, on toned paper, illustrated. The most attractive edition for a small amount of money published in the country. Complete in 23 vols. Green cloth extra, per vol., $1 25; per set, $28 75. Half-calf, gilt back, per vol. $3; per set, $69.

Also,

TALES OF A GRANDFATHER.

Globe Edition. To match the new Globe Edition of Waverley. 4 vols., green cloth, extra, per vol., $1 25; per set, $5. Half-calf, gilt, per vol., $3; per set, $12.

The only edition containing the Fourth Series, "Tales from French History." This is the only complete edition published.

LIPPINCOTT'S MAGAZINE.

AN ILLUSTRATED MONTHLY OF

Popular Literature and Science.

NOW READY:

THE JANUARY NUMBER,

Especially suited to the Holidays. Commencing the new volume with

TWO FINE FULL-PAGE ENGRAVINGS.

CONTENTS.

I. THE RED FOX. A beautiful and pathetic story, containing a striking picture of Indian character. By Clara F. Guernsey. Illustrated.
II. AN AMERICAN'S CHRISTMAS IN PARIS. A lively sketch of the embarrassments of An American unacquainted with French. By Celia Logan Kellogg.
III. WHOM ALL THINGS NAME. A poem founded upon a Mohammedan legend. By Helen Bostwick.
IV. THE PANHELLENIC DREAM. A masterly article upon the Eastern question. Rich in curious facts and novel views. By Stephen Powers.
V. A TRIP TO DAHOMEY. An interesting account of the only visit ever made by an American to the City of Abomey. In Two Parts. Part I. By J. W. Watson.
VI. HATHAWAY STANGE; or, THE SECOND OF JANUARY. A spirited and captivating story. In Two Parts. Part I.
VII. LIFE. A pleasing and thoughtful poem. By M. H. K.
VIII. SCRIBBLES ABOUT RIO. A very able and interesting article, replete with anecdotes of the Imperial family and court. By Robert M. Walsh, formerly Secretary of Legation at the Court of Brazil.
IX. IRENE. Part IV. An entertaining story of Southern life. Illustrated.
X. MY HOUSEKEEPING IN ROME. A description of domestic life in the Eternal City. By Pauline E. Henry.
XI. THE INDUSTRIAL AND FINANCIAL EFFECTS OF THE FRANCO-PRUSSIAN WAR. A valuable and exhaustive paper, distinguished for the accuracy of its statements and the fulness of its details. By David A. Wells, late Special Commissioner of the Revenue.
XII. OLD AND NEW. A poem] appropriate to the season. By Edgar Fawcett.
XIII. BOYS. A very amusing sketch. By A. G. Penn.
XIV. OUR MONTHLY GOSSIP.—Charles IX. of Denmark—Young Russia—Some Recollections of Thackeray—M. Guizot—Parings.
XV. LITERATURE OF THE DAY.

The Seventh Volume of this Magazine begins with the January number, and the conductors feel justified in stating that the arrangements already made, with those still in progress, for the coming year, are such as will enable them to furnish an increased amount of popular reading in the best and most emphatic sense.

A larger space than heretofore will be devoted to "Our Monthly Gossip," which will be enriched with short and lively articles on persons of note, incidents of the day, and other novel or amusing topics. Reviews and Book Notices, written with ability and entire independence, will be included in the "Literature of the Day."

Illustrations designed by distinguished artists, and engraved in the highest style, will accompany each number.

TERMS.—Yearly Subscription, $4; Single Number, 35 cents.

CLUB RATES.—Two Copies, $7; Five Copies, $16; Ten Copies, $30; and each additional copy, $3.

Specimen Number mailed to any address on receipt of 25 cents.

715 and 717 Market Street, Philadelphia.

PROSPECTUS FOR 1871.

Eclectic Magazine
OF
FOREIGN LITERATURE.

New Volume begins January, 1871.

NOW IS THE TIME TO SUBSCRIBE.

The *Eclectic* reprints the best Essays, Reviews, Stories, and Scientific Articles from the prominent English, French, and German periodicals. Its selections are very carefully made, and for more than a quarter *of* a century it has maintained its position as the leading exponent of foreign contemporary thought.

SPECIALTIES OF THE ECLECTIC.

Science.

It is believed that in this department the *Eclectic* is more comprehensive and complete than any other Magazine in the world not exclusively devoted to the subject.

Biography.

There is no department of Literature more important, and at the same time more generally interesting, than Biography. In this department, therefore, will be found sketches of most of the famous men of present and past times.

Belles-lettres.

Polite Literature in all its branches is represented by the best selections which can be gleaned from the whole field of periodical literature abroad.

Fiction.

In this department the best Current Literature of its class is found, comprising occasional Serials by the best contemporary novelists, but chiefly the short stories for which the English Magazines are deservedly celebrated.

General Literature.

Under this head are embraced all those subjects which elude special classification—for instance, the fine Essays on Political, Social, and Literary Topics which fill the English quarterlies and monthlies.

Editorial Departments.

The Editorial Departments are: LITERARY NOTICES, FOREIGN LITERARY NOTES, SCIENCE, ART, and VARIETIES. They have been remodelled and extended, so as to embrace every possible topic, and *there is no other eclectic publication which even attempts such a synopsis.*

Illustrations.

A very fine STEEL ENGRAVING on some subject of general interest, either Historic, Portrait, or Ideal, embellishes each number. These engravings are executed in the best manner and by the best artists, and are of permanent value.

Terms: Single copies, 45 cents; one copy, one year, $5; two copies, one year, $9; five copies, one year, $20. Clergymen and Teachers supplied at club rates. Agents wanted to get up clubs. Address

E. R. PELTON, Publisher,
108 Fulton Street, New York.

The Nation.

NEW YORK, THURSDAY, DECEMBER 29, 1870.

The Week.

CONSIDERING that last Christmas-Day was the eighteen hundred and sixty-ninth anniversary of the birth of Christ, and that the religion he founded was above all things the religion of love, the condition of the Christian world presents a curious spectacle. Some forty millions of German Christians are helping in every way in their power to kill and maim a similar number of French Christians and destroy their property. Large numbers of young French Christians, too, are lying in wait behind hedges and in ditches, trying to shoot passing German Christians through the head; and when German Christians catch them, they shoot *them* through the head. Over half of France, the Christian churches are turned into hospitals for persons whom their brother Christians have horribly gashed and mutilated. In another quarter of Europe, Russian Christians announce their determination to kill and maim any number of Latin Christians, besides Mohammedans, that may be necessary in order to secure themselves the privilege of keeping in the Black Sea as many instruments for destroying life and property as they think proper, and the Latin Christians reply that they will, in their turn, slaughter any number of Greek Christians sooner than submit to anything of the kind. Over here we do not at present propose to kill anybody, but it is only a few weeks since a notorious Massachusetts Christian got up and calmly proposed, as a means of making political capital for the party, that American Christians generally should go to killing English and Canadian Christians, and destroying their property, on account of a certain sum of money; and large numbers of the more "advanced" Christians think that, although he was mistaken, he is still a dear, delightful, naughty man, and that they must really forgive him. To a heathen looker-on of some cultivation and sense of humor, the whole thing, the festival included, would be as good as a play.

The effect of it all is heightened by the fact that, in the midst of these horrors, we usually have peace-meetings, which call attenion to the fact that war is brutal, and works great suffering, and brings sorrow into peaceful homes, and causes mothers the loss of their sons—the speakers being evidently under the impression that as soon as this astounding information gets abroad, all fighting ought to come to an end. We had one of these last week in this city, at which many excellent things were said, but hardly one that went near the root of the difficulty, as we have endeavored to show elsewhere. The way in which the root of the difficulty is sometimes avoided, even by able men, was illustrated in Mr. D. D. Fields's violent condemnation in his speech of the conduct of the Germans in driving back into Metz the civilians whom Bazaine sent out. But then the barbarity of the affair goes a great deal further back. The responsibility for the sufferings of the inhabitants of fortified cities belongs to those who fortify them, and not to those who besiege them, and it is the practice of fortifying populous towns which should be forbidden by international law. Mr. Fields's reprobation of refusing egress to women and children every humane man will sympathize with, but then every humane man must reprobate firing a mitrailleuse into a dense column of husbands and fathers. War is a game with horrible rules, but unless you can stop the game outright, there is little use in inveighing against the rules.

M. Laveleye, a well-known writer in the *Revue des Deux Mondes*, contributes to the last number of the *Fortnightly Review* an interesting article on the "Future of France," in which he speaks of the Republic as the most likely form of government, not because many people want it, but because it is, as Thiers said, the form about which there is least division of sentiment—that is, Orleanists would sooner have it than Imperialism, and the Legitimists than either Orleanism or Imperialism, and so on. But he ascribes, like the rest of the world, the misfortunes of France to ignorance and vanity. He repeats the sad story M. Duruy, the best minister the Empire ever had, told him of the impossibility he found in procuring an appropriation of $200,000 for schools, while double that sum was given freely for the construction of the new opera-house or the subventions of theatres. In fact, there grew up under the Empire a contempt for "culture" very like something we occasionally meet with among some of the brethren here, and against which we venture, in the light of what is happening in France, to warn them respectfully. The "practical men," M. Laveleye tells us, thought they could thrash the "spectacled professors" from Germany out of their boots, and have not to this hour quite got over their astonishment at what "the professors" did to them. There is a story, not one of M. Laveleye's, but well authenticated, of a young French officer who translated Marsh's "Man and Nature," and asked, as is customary, the permission of the Minister of War to publish it. It was refused, and he was informed sharply that officers had no business with such pursuits. There seems to be little doubt, however, that France will, as the result of the war, enter on a new life, and it is permissible to believe that, awful as her sufferings are, she could not have been taught her needs at any less cost.

The situation in France may be summed up by saying that though the new armies have fought well—it is absurd for any one who has heard of Gravelotte to say, as some people do, that they have fought better than "the official armies"—they have accomplished nothing beyond bringing about the desolation of a still wider area of their unhappy country, and that the end is just as certain as it was two months ago. The Mobiles have stood up wonderfully well for raw troops, and are evidently led by a new race of officers, men very unlike the popinjays and debauchees who swarmed in the Imperial forces, but they are no match or anything like a match for the Prussians. In the late sorties all parties confess they were unsteady, and that though there was much hard fighting the regulars and the forts did the bulk of it. Even the pious Bretons behaved badly. Where the French partisans see the grounds of hopefulness in the situation, it is hard to discover. The force which Frederic Charles has been smashing on the Loire, and Manteuffel at Amiens, are the result of the three months' respite given to France by the sieges of Paris and Metz, and of an infinite amount of lying and proclaiming. There is not the least reason to suppose that, once used up, anything will take their places.

A curious example of poetic justice has been brought to light in the Imperial correspondence captured at the Tuileries, in the shape of a warm address in favor of the war from the municipal council of Sedan. We wonder what the councillors thought of war when the Prussian batteries were raining on them on that awful morning in September. It must have borne quite a different look from what it did when they thought it was the Berliners and Stuttgarters who were going to be bombarded. Poor Ducrot has been making a fool of himself, by "swearing" in a general order issued to the troops on the morning of the great sortie, that he would only return "victorious or dead." He has been repulsed, and is alive and well, and, the correspondents say, is sorry and ashamed, and does not well know what to do. We were therefore mightily entertained at learning from that wonderful fellow, the correspondent of the *World*, that he had left Paris in a balloon.

The French have made another combined movement to relieve their besieged capital—this time from the north—and have again failed. The first important fight in this movement took place on the confines of the Departments of Aisne and Nord, near Fontenelle, and resulted in the defeat of the French, reported to have been ten thousand strong. The bulk of General Faidherbe's army, however, moved on Amiens. A reconnoissance in force by the Prussians, near that city, was repulsed. The decisive battle was fought, on the 23d, north of Amiens, the contending forces occupying positions between the confluence of the Encre and the Somme, near Pont Noyelle, to the Niève, near Naours (not Daours, or Davours, as our reports have it, which also mistake Ailly-le-Haut-Clocher, north-west of Amiens, for Ailly-sur-Noye, south of it). The French despatches, which claim an indecisive advantage after a contest of many hours' duration, admit that on "the next day, the enemy showing no disposition to renew the fight, General Faidherbe returned to Albert;" and thus but confirm King William's bulletin, which announces a Prussian victory, the capture of a thousand prisoners, and the pursuit of the French by General Manteuffel in the direction of Arras. The number of the French troops engaged is stated in unofficial reports as high as sixty thousand, which is likely to be an exaggeration. Manteuffel's forces must have been much less numerous, as a part of his army continued to operate against Havre.

Two days before the battle of Amiens, the Parisian commanders, anticipating relief from the north, made a vigorous sortie in that direction—our reports almost uniformly have "south" for "north"—supported by demonstrations on the east and west. The main attack was made by the garrison of St. Denis and a force of marine troops under Admiral De la Roncière, on the Saxon position at Le Bourget, while General Ducrot, on the right, occupied Drancy and Groslay, east of St. Denis, and engaged in a violent artillery action against the besieging strongholds around Blanc-Mesnil; and, still further east, another French force advanced as far as Gagny and Neuilly-sur-Marne. The movement was successful at the onset, but ended in failure, as the French, after having captured Le Bourget, with a considerable sacrifice of men, were unable to hold it against the rallying Saxons, and compelled to retreat. They continued, however, for some time to hold the positions occupied east of the city; but as no further fighting has since been reported from either side, it may be presumed that these too were abandoned on the following day, the 22d, or on the receipt of the news of General Faidherbe's defeat.

A French official report from Le Mans, of the 24th, announcing the withdrawal of a large Prussian force from Nogent-le-Rotrou, in the direction of Paris—which naturally took place in accordance with orders issued before affairs were decided both before Paris and before Amiens—shows that the Prussians had not been perfectly tranquil before the double movement combined against them. That withdrawal may have given a momentary relief to General Chauzy at Le Mans, who, though reinforced from Cherbourg, seems to be rather hard-pressed by the armies of Prince Frederic Charles, the left wing of which, having occupied Blois and Tours, and defeated various French detachments between the Loire and the Loir, is now advancing against the right of the French position between the latter river and the Sarthe. General Bourbaki, with his division of the former Army of the Loire, seems to hold himself on the defensive, observed by one of Frederic Charles's corps, between the Loire and the Cher. Gambetta, who spent some time at Bourbaki's headquarters in a vain attempt to organize a new advance in that region, has left for Lyons, where the people, frightened and exasperated by Von Werder's threatening victory at Nuits, south of Dijon, have allowed some "Red" demagogues to indulge in the "terroristic" amusement of sentencing and putting to death two French officers entirely unconnected with that defeat of the Garibaldians and Lyonnese in Burgundy.

There is news of an incident at Rouen which is likely to prove irritating enough in England—the sinking of some English ships in the Seine by the Prussians, for the purpose of impeding the navigation, the crews being turned adrift, after suffering the loss of all their property. The Prussian generals are gradually growing more high-handed in their proceedings—the usual result of prolonged operations in an enemy's country—and this outrage was probably simply a piece of recklessness on the part of one of them. Bismarck will no doubt disown it, and apologize for it; but the English public will insist on substantial compensation, will chafe under the delays of negotiation, and Bismarck's probably by no means soothing tone in conducting it, so that, although the affair will not end in war, it will work England up one step nearer to the fighting mood; and if she once gets into this it would be difficult to prevent a general European set-to—she being thus far the great check on the bellicose propensities of the other powers.

Russia has been getting ready for the fray by a total change in her military system, for which she is about to substitute that of Prussia, that is, a general conscription without exemptions, and with a short term of service. As to the state of feeling in the empire, there is no question about the enthusiasm with which the proposal of the Government to break up the neutrality of the Black Sea has been received; but the Berlin correspondent of the London *Times*—a remarkably well-informed Prussian—says the Russian public is by no means pleased with the prospect of an alliance with the Germans, whom the Russian nationalists detest, and would vastly prefer having Russian policy worked out in alliance with the French. The story of the existence of a large fleet of iron-clads at Nicolaieff receives no confirmation.

In the meantime, it would seem as if she had not as much to fear as was supposed from Austria, whose last financial statement makes a most pitiful show. The army is already enormous, and the Minister of War wants to mobilize it, in view of existing complications, and demands an extraordinary credit of 60,000,000 florins; but the Cisleithan or Austrian Minister of Finance is obliged to own to a deficit in last year's revenue of 25,000,000 florins; and when the empire cannot meet its current expenditure, what is the use of trying to borrow or talking of going to war? Of the state of mind of the Bohemians, and of the difficulties in the work of unification, a striking illustration was afforded the other day by the conduct of the Municipal Corporation of Prague, which refused to allow the school-houses used by the German children to be warmed, and finally sold them to be used as warehouses. The proposition of the Board of Education, too, that the Bohemian children should be taught "a little German," raised violent opposition, and public meetings were held to denounce it.

The accounts from all sections of the business world continue monotonously discouraging. Money is scarce and difficult to obtain, apart from speculative manipulations in Wall Street. Liberal amounts of currency continue to be sent West, in payment of grain and meats, and South, in payment of cotton, and do not seem to return promptly, the complaint of irregular collections being all but universal. Failures are numerous, but not large, and the despondent tone of business-men appears to be rather due to diminished profits than to actual losses. The winding-up of a life insurance company at the demand of the Insurance Inspector at Albany, and the condition of the real-estate market, cause uneasiness; while the unsettled question of the Pacific Railroads causes all new railroad enterprises to halt in their progress. The weak condition of the New York banks is best shown by the fact that the withdrawal of a few millions of currency by a knot of speculative gamblers was sufficient to make money worth a quarter and one-half per cent. a day. The coal strike threatens to become universal, but has not as yet produced as great an advance in price as was expected; nor is it likely to do so, if the reports of an early suspension in some of the iron districts should prove correct. The retail trade of the city for the holidays has not been large; but the exports of breadstuffs and cotton have been active, at a slight advance in prices, the foreign demand for both these articles having increased, while the receipts, especially of flour and cotton, have materially declined. Railroad and other securities have been somewhat lower than last week; but Government bonds remain firm. The January dividend lists, as a general thing, show no great change from last year; and on the whole, the business of the year has been healthier, if less apparently profitable, than for any year since 1859. The year 1870 is certainly entitled to the credit of having witnessed the end of the ten years' gambling mania.

The New York *Tribune* accuses us of divers "naked untruths" with regard to the woollen manufacturers' dinner at Delmonico's, and notably of having misrepresented Mr. Mudge the Chairman's sentiments with regard to the effect of the American tariff on English pauperism. We might, on the authority of precedents, which the *Tribune* will be the last to repudiate, reply that the writer of the criticism on us is "a liar, and a villain who lies knowingly, wilfully, and with intent to deceive;" but we shall content ourselves with saying that the *Tribune* was either guilty of "a naked untruth," on the 15th of December, when, in its report of the wool manufacturers' dinner, it said "the gathering was not called in the interests of protection, but was simply a complimentary dinner, tendered by the commission merchants of New York to the wool manufacturers of the country;" or was guilty of an "untruth," also "naked," on the 24th of December, when it said that the gathering was a "counter-demonstration" got up by the protectionists. When, therefore, it takes the *Nation* to task for "*not* remarking that no full and fair report of the speeches was given in any free-trade organ," to the wickedness of untruthfulness it adds the folly of self-stultification. There is only one free-trade organ in this city—the *World*—which is in the habit of giving full reports of meetings, and we believe it was deceived by the *Tribune*, or the promoters of the dinner, into the belief that "it was not called in the interest of protection:" in other words, it was made the victim of "a naked untruth."

As to Mr. Mudge's speech, he made in it, with regard to English pauperism, two assertions: one was that it was his duty as an American to keep the tariff high ("advocate such measures as will benefit his country") "even if pauperism did increase in England." By this proclamation of the doctrine of pure selfishness as the right rule of political action for an American citizen, we said no doubt Dr. Bellows, as a Christian minister, was startled. We hope and believe he was. All nations have thus far acted on it, but it is none the less a robber's doctrine, and regulated life in the castles on the Rhine centuries before Mr. Mudge was born. His second proposition was that pauperism had increased in England as a consequence of the American tariff (which is untrue, but Mr. Mudge probably did not know it). Said he, "The reason pauperism increases there is that her rulers insist that she shall be the workshop of the world for the production of certain articles, and, as she has over-produced these for her own consumption, and for other markets which she controls, she is, since we have shut her out from ours, fighting desperately for her life. This is no fancy-sketch. The number of paupers in England has been steadily increasing since our tariff enabled people to manufacture for themselves, and unless she can induce us to adopt her free-trade theories she must resign her leadership of the trade of the world, as she has been forced to give up her supremacy in the political affairs of the world." We did not comment, as we might have done, on the absurdity of talk of this kind about a tariff which has actually almost completely driven American products out of foreign markets, and let the British in their place. We simply said—still thinking of the way Dr. Bellows was "sold" in having "the complimentary dinner to the woollen manufacturers of the country" to which he was invited converted under his nose into a "protectionist counter-demonstration"—that he must have been startled "to hear it mentioned as one of the recommendations of the American tariff that it had increased the number of paupers in Great Britain." Whether this passage from Mr. Mudge's speech warranted the construction we put upon it, we must leave our readers to determine. We do not and cannot quote everything we comment on, but we believe our summings-up of the sayings of public men during the last five years have very seldom been questioned on the score either of accuracy or fairness.

We may add that we are rather surprised at the *Tribune's* calling on us for chapter and verse in support of any charge against anybody, considering that it has, for two years nearly, steadily refrained from publishing the passage from the *Nation* on which it three times based the assertion that we had accused General Grant of having been bribed, and has disgraced journalism by a series of slanders on Mr. D. A. Wells, of which it never offered, or pretended to have, a particle of proof, and of which one of the most innocent was accusing him of lying in giving an account of the wool-clip of 1868, which was exactly the same as that given by Mr. Greeley in his book about political economy. For this series of scandalous misrepresentations it has never offered either the public or its victims one word of apology. We confess it has greatly improved within a year or two. It is more sensible, accurate, moderate, and better informed than it has ever been in its whole history, and has nearly given up bawling, but its protectionism seems to exercise a positively diabolical influence on its morals, and would spoil its manners if it had any manners.

The President improved the occasion of a visit from the "Boys in Blue," last week, to bestow a neat rap on the scheme to remove the national capital, the constitutionality of which, he said, was more than doubtful, and which at all events should not be left to a mere Congressional majority, nor surrounded by any less restrictions than an amendment of the Constitution. He added that this might seem singular and "unpopular" doctrine for a Western man, but that he was in earnest. This declaration will, we trust, have the effect intended, not of defeating the scheme in question, which local jealousy would suffice to kill, but of suppressing the petitions and conventions which a suspicion of Executive favor might have made a nuisance of the first order. The Cincinnati demonstration was a pure failure, exciting no enthusiasm on the spot, and costing the promoters of it the full amount of hotel charges and hall-rent. We may not have heard the last of these gentlemen, but now that they have the President as well as time and common sense against them, the public need not trouble itself further with their arguments and proceedings.

General Butler has introduced an amnesty bill, which amnesties everybody guilty of participation in the late rebellion, except graduates of West Point, members of Congress at the outbreak of the rebellion, heads of departments, or foreign ministers in the service of the United States, members of conventions which adopted ordinances of secession, persons who ill-treated Union prisoners or who embezzled United States funds, and bounty-jumpers and deserters. The bill, also, reserves all cemeteries and burying-grounds which contain the graves of United States soldiers. The objection to the bill is, that all those persons are excluded from its benefits whose condition really makes an amnesty of any interest or importance to the South. Considered, therefore, as a means of soothing the South, the measure is worth little or nothing. In the Senate, Mr. Schurz has introduced a resolution laying it down that an amnesty should be full and complete, and without exceptions, to which there is the objection that there are at least half-a-dozen persons whose reappearance in Congress, or in Federal offices of any kind, would be not simply a scandal, but a real injury to the public conscience.

One of the curious things brought out in the St. Domingo debate in the Senate was Mr. Sumner's admission, or rather proclamation, that when the President once called on him at his house, to persuade him into support of the annexation scheme, he (Mr. Sumner) interrupted the conversation on that insignificant theme to plead the cause of Mr. Ashley, whom the President had just very properly removed from the governorship of Montana, to which it was a great scandal ever to have appointed him. Mr. Ashley, when a member of the Committee on Territories, entered into a formal partnership with a land speculator, by the terms of which he was to supply the speculator with information procured by him as a member of the committee, and then was to share in the profits. Having been found out—though not expelled from the House, as he ought to have been—he took up the business of being "sound on the main question," and blew the impeachment horn with such frenzy and yet with such judgment as quite to captivate Mr. Sumner, on whom his misconduct as a legislator does not seem to have made the smallest impression. Another curious incident of the debate to which the Chicago *Tribune* calls attention is, that an attempt is being made by the majority to leave Mr. Sumner "out in the cold" for the independent and conscientious exercise of his judgment, precisely similar to that which he tried last spring against Mr. Trumbull. "It's a long lane that has no turning" is a very well-known proverb, but which few politicians sufficiently remember.

THE ST. DOMINGO ROW.

We presume that a very small portion of the public read the President's statement of his reasons for wishing to annex St. Domingo without a little pain as well as surprise. Of the value of his military arguments we do not presume to speak. To the ordinary lay mind, the notion that fifty millions of people, doubling their numbers every twenty-five years, and owning almost the whole continent of North America, and separated from every great naval power by three thousand miles of ocean, would run some severe risk if it should go to war without owning an island in the West Indies, wears a look of profound mystery. But then most laymen are relieved from all anxiety on this point and all desire to understand it, by their perfect assurance that there will be no war requiring an island in the West Indies unless we choose to make it, and that we shall have the West Indian Islands quite as soon as we know what to do with them after we have got them. The President's economical arguments most people, we are sure, charitably believed were not his own. It is no discredit to a brave and skilful soldier such as he is not to understand "the balance of trade," or to be cheated by some ignorant politician into the belief that $100,000 worth of Dominican products, imported into the United States, would do great harm if they came from the "Republic of Dominica," but great good if they came from the "State of Dominica" in the American Union; that in the one case they would help to ruin the United States, but in the other help to pay off the national debt. Men of far more natural acuteness than General Grant have fallen into similar errors on this subject, and everybody would willingly have passed all this by without notice if it were simply an expression of opinion. But when we find him founding a "policy" on it, and attempting by hook or by crook to force that policy on the acceptance of Congress and the country, his mistake assumes serious importance.

The facts of this St. Domingo affair, we believe, are, that the President—we do not know under what influences—has got it into his head that the United States ought to own half the island of Hayti, and that it is of such serious importance to them to acquire it at once that it is better, in a time of considerable confusion, and with a very large mass of ignorance already weighing on the national vitality, to buy it, and make citizens of 200,000 ignorant Catholic Spanish negroes, than to wait one minute longer. He accordingly, last year, sent General Babcock, a young officer attached to his person in the capacity of aid-de-camp, to the island as an investigator, on the representations of one Baez, who is nominally president of the Republic, and wants to sell the whole concern, but of whose authority to sell it, or weight with the people, we know nothing. General Babcock not only "investigated," we believe without any knowledge of the Spanish language, but concluded a convention for the cession of the Republic to the United States, and brought it back cut and dried in his pocket, greatly to Mr. Fish's astonishment, who had never heard of it. This treaty the President is now pressing, for the second time, on the acceptance of the Senate, our ignorance of the condition of the republic, of the disposition of the people, and of the difficulties and dangers we shall encounter in taking charge of them, being just as great as ever. Let us add that there is a strong and not by any means unfounded suspicion that behind the whole scheme there is a ring of "operators," of one sort or another, busily at work, into whose hands the new state would fall immediately on its annexation, and whose activities and profits would surpass anything they have treated us to here, in the ratio in which the people of the island surpass our own people in simplicity and ignorance, and the products of their soil those of our own soil in richness and variety. We are far from alleging that the President is conscious of any such influences; but then he has shown recently an unfortunate facility in being hoodwinked by plausible knaves which makes us wish heartily that he would, for the sake of his own reputation—in which, as we have said more than once before, the country has a deep interest—let the St. Domingo business drop at once and for ever.

Mr. Sumner has in the Senate opposed the scheme with a warmth which it fully deserves, and with which there would be no fault to find if his personal relations with the President had not for some time past been very cold, if cold be the proper word to apply to a state of feeling which has found vent on Mr. Sumner's side in frequent and bitter denunciations. The knowledge of this which the Senators possess, combined with the fact that when Mr. Sumner feels strongly, his rhetoric always gets the better of him, and produces the impression on his audience that he looks for an earthquake within a reasonable period after he sits down, has prevented his hostility to the St. Domingo scheme having the weight it deserves, and made the debate last week a scene of disgraceful violence and recrimination. The Republican majority in the Senate have assailed him in a way from which the goodness of his cause ought to have protected him, and have proposed his removal from the Chairmanship of the Committee on Foreign Affairs for reasons which will commend themselves to most people as arguments of the strongest kind for his retaining it. If he is the best man for the place—and his opposition to this extraordinary enterprise, even if he had rendered no other service, would seem to prove it—it would be a very singular step to drive him from it as a penalty for disrespectful language to the President. The duty of the Chairman of the Committee is to examine the President's projects in all that relates to foreign affairs, and hostility to the President is a disqualification for it only when it becomes factious, which can hardly be affirmed of Mr. Sumner's hostility as yet.

The Senate has sought escape from the embarrassments of the situation by passing a resolution providing for the organization of a Commission of Investigation to go to the island, and report on its social, moral, religious, political, agricultural, geological, and meteorological condition. The range of enquiry is sufficiently wide to cut out work for the next ten years, and the terms of the resolution sufficiently vague to leave it in the power either of the President or the commission to make the report worthless. But there is another and more serious objection to the whole proceeding. There is nothing whatever to prove the propriety of issuing such a commission except the President's desire for the annexation, and there is no good reason for confining the operations of the committee to St. Domingo. Congress has no more right to send down and examine that island with a view to its absorption than any of the other barbarous, ignorant, and troubled states which lie between our southern border and the Straits of Magellan. They are nearly all blessed as regards climate, soil, and productions, and offer magnificent fields to American enterprise; they are nearly all inhabited by people who have thus far shown themselves utterly incapable of self-government, and who, nevertheless, eagerly desire peace and quiet, and would be very much obliged to anybody who would undertake to supply them. If their ignorance and turbulence and weariness of their own management of their own affairs, and our ability to make money out of them, are good reasons for annexing the Dominicans, they are good reasons for annexing Cuba, and Jamaica, and Mexico, and Nicaragua, and Costa Rica, and ever so many other islands, states, and territories, and the commission of enquiry ought to be made perpetual, and its range be extended over all barbarous peoples. But we deny the right of Congress to send out any such body even to St. Domingo till the sense of this country has been distinctly taken on this whole policy of absorbing semi-civilized Catholic states. The sense of the country has not been taken, but we believe it to be firmly opposed to it; and we make no scruple about saying "Catholic states," in view of the practical establishment of the Catholic Church in New York, through the influence of ignorant Catholic voters. The first duty of the American Union is to its own people. As long as there is ignorance, poverty, and corruption within its own borders, it owes it not less to civilization than to its own influence and fame not to saddle itself with fresh loads of responsibility. A nation which contains a problem like New York City is morally bound to solve it before taking up another in some respects far more serious.

PEACE.

The horrors of war are just now making a deeper impression than ever on the popular mind, owing to the close contact with the battle-field and the hospital into which the railroad, and the telegraph, and the newspaper have brought the public of all civilized countries. Wars are fought out now, so to speak, under every man's and woman's eyes; and, what is perhaps of nearly as much importance, the growth of commerce and manufactures, and the increased complication of the social machine, render the smallest derangement of it anywhere a concern and trouble to all other nations. The consequence is that the desire for peace was never so deep as it is now, and the eagerness of all good people to find out some other means of deciding international disputes than mutual killing never so intense.

And yet, the unconsciousness of the true nature and difficulties of the problem they are trying to solve which is displayed by most of those who make the advocacy of peace their special work, is very discouraging. We are far from believing that the incessant and direct appeals to the public conscience on the subject of war are not likely in the long run to produce some effect; but it is very difficult to resist the conclusion that the efforts of the special advocates of peace have thus far helped to spread and strengthen the impression that there is no adequate substitute for the sword as an arbiter between nations, or, in other words, to harden the popular heart on the subject of military slaughter. It is certain that, during the last fifty years, the period in which peace societies have been at work, armies have been growing steadily larger, the means of destruction have been multiplying, and wars have been as frequent and as bloody as ever before; and, what is worse, the popular heart goes into war as it has never done in past ages.

The great reason why the more earnest enemies of war have not made more progress towards doing away with it has been, that, from the very outset of their labors down to the present moment, they have devoted themselves mainly to depicting its horrors and denouncing its cruelty and inhumanity. In other words, they almost invariably approach it from a side with which nations actually engaged in it are just as familiar as anybody, but which has for the moment assumed in their eyes a secondary importance. The peace advocates are constantly talking of the guilt of killing, while the combatants only think, and will only think, of the nobleness of dying. To the peace advocates the soldier is always a man going to slaughter his neighbors; to his countrymen he is a man going to lose his life for their sake—that is, to perform the loftiest act of devotion of which a human being is capable. It is not wonderful, then, that the usual effect of appeals for peace made by neutrals is to produce mingled exasperation and amusement among the belligerents. To the great majority of Europeans our civil war was a shocking spectacle, and the persistence of the North in carrying it on a sad proof of ferocity and lust of dominion. To the great majority of those engaged in carrying it on, the struggle was a holy one, in which it was a blessing to perish. Probably nothing ever fell more cruelly on human ears than the taunts and execrations which American wives and mothers heard from the other side of the ocean, heaped on the husbands and sons whom they had sent to the battle-field, never thinking at all of their slaying, but thinking sorely of their being slain; and very glad indeed that, if death had to come, it should come in such a cause. If we go either to France or Germany to-day, we shall find a precisely similar state of feeling. If the accounts we hear be true—and we know of no reason to doubt them—there is no more question in the German and French mind that French and German soldiers are doing their highest duty in fighting, than there was in the most patriotic Northern or Southern home during our war; and we may guess, therefore, how a German or French mother, the light of whose life had gone out at Gravelotte or Orleans, and who hugs her sorrow as a great gift of God, would receive an address from New York on the general wickedness and folly of her sacrifice.

The fact is—and it is one of the most suggestive facts we know of—that the very growth of the public conscience has helped to make peace somewhat more difficult, war vastly more terrible. When war was the game of kings and soldiers, the nations went into it in a half-hearted way, and sincerely loathed it; now that wars are literally an outburst of popular feeling, the friend of peace finds most of his logic powerless. There is little use in reasoning with a man who is ready to die, on the folly or wickedness of dying. When a nation has worked itself up to the point of believing that there are objects within its reach for which life were well surrendered, it has reached a region in which the wise saws and modern instances of the philosopher or lawyer cannot touch it, and in which pictures of the misery of war only help to make the martyr's crown seem more glorious.

Therefore, we doubt, and everybody doubts who looks at facts, whether the work of peace is well done by those who, amidst the heat and fury of actual hostilities, dwell upon the folly and cruelty of them, and appeal to the combatants to stop fighting on the ground that fighting involves suffering and loss of life, and the destruction of property. We do not hesitate to affirm that the principal effect of this on "the average man" has been to produce the impression that the friends of peace are ninnies, and to make him smile over the earnestness with which everybody looks on his own wars as holy and inevitable, and his neighbors' wars as unnecessary and wicked. Any practical movement to put an end to war must begin far away from the battle-field and its horrors. It must take up and deal with the various influences, social and political, which create and perpetuate the state of mind which makes people ready to fight. Preaching up peace and preaching down war generally, are very like general homilies in praise of virtue and denunciation of vice. Everybody agrees with them, but nobody is ever ready to admit their applicability to his particular case. War is, in our time, essentially the people's work. Its guilt is theirs, as its losses and sufferings are theirs. All attempts to saddle emperors, kings, and nobles with the responsibility of it may as well be given up from this time forward.

Now, what are the agencies which operate in producing the frame of mind which makes people ready to go to war on small provocation? It is at these the friends of peace must strike, *in time of peace*, and not after the cannon has begun to roar, and the country has gone mad with patriotism and rage. They are, first of all, the preaching in the press, and elsewhere, of the false, damnable, and pernicious doctrine, that one nation gains by another's losses, and can be made happy by its misery; that the United States, for instance, profits in the long run by the prostration of French, German, or English industry. One of the first duties of a peace society is to watch this doctrine, and hunt it down wherever they see it, as one of the great promoters of the pride and hardness of heart which makes war seem a trifling evil. America can no more gain by French or German ruin, than New York can gain by that of Massachusetts. Secondly, there is the mediæval doctrine that the less commercial intercourse nations carry on with each other, the better for both, and that markets won or kept by force are means of gain. There has probably been no more fruitful source of war than this. It has for three centuries desolated the world, and all peace associations should fix on it, wherever they encounter it, the mark of the beast. Thirdly, there is the tendency of the press, which is now the great moulder of public opinion, to take what we may call the pugilist's view of international controversies. The habit of taunting foreign disputants, sneering at the cowardice or weakness of the one who shows any sign of reluctance in drawing the sword, and counting up the possible profit to its own country of one or other being well thrashed, in which it so frequently indulges, has inevitably the effect not only of goading the disputants into hostilities, but of connecting in the popular mind at home the idea of unreadiness or unwillingness to fight with baseness, and meanness, and material disadvantage. Fourthly, there is the practice, to which the press, orators, and poets in every civilized country steadily adhere, of maintaining, as far as their influence goes, the same notions about national honor which once prevailed about individual "honor"—that is, the notion that it is discreditable to acknowledge one's self in the wrong, and always more becoming to fight than apologize. "The code" has been abandoned in the Northern States and in England in the regulations of the relations of individual men, and a duellist is looked on, if not as a wicked, as a crack-brained person; but in some degree in both of them, and in a great degree in all other countries, it still regulates the mode in which international quarrels are brought to a conclusion.

Last of all, and most important of all, it is the duty of peace societies to cherish and exalt the idea of *law* as the only true controller of international relations, and discourage and denounce their submission to *sentiment*. The history of civilization is the history of the growth amongst human beings of the habit of submitting their dealings with each other to the direction of rules of universal application, and their withdrawal of them from the domain of personal feeling. The history of "international law" is the history of the efforts of a number of rulers and statesmen to induce nations to submit themselves to a similar régime—that is, to substitute precedents and rules based on general canons of morality. and on principles of municipal law, for the dictates of pride, prejudice, and passion, in their mode of seeking redress of injuries, of interpreting contracts, exchanging services, and carrying on commercial dealings. Their success thus far has been only partial. A nation, even the most highly civilized, is still in its relations with its fellows in a condition somewhat analogous to that of the individual savage. It chooses its friends from whim or fancy, makes enemies through ignorance or caprice, avenges its wrongs in a torrent of rage, or through a cold-blooded thirst for plunder, and respects rules and usages only fitfully, and with small attention to the possible effect of its disregard of them on the general welfare. The man or the woman and, let us say, "the mother"—since that is supposed to be in this discussion a term of peculiar potency—who tries to exert a good influence on public opinion on all these points—to teach the brotherhood of man as an economical as well as a moral and religious truth; to spread the belief that war between any two nations is a general calamity to the civilized world; that it is as unchristian and inhuman to rouse national combativeness as to rouse individual combativeness; as absurd to associate honor with national wrongdoing as with individual wrongdoing; and that peace among nations, as among individuals, is, and can only be, the product of general reverence for *law* and general distrust of *feeling*—may rest assured that he or she is doing far more to bring war to an end than can be done by the most fervid accounts of the physical suffering it causes. It will be a sorrowful day for any people when their men come to consider death on the battle-field the greatest of evils, and the human heart will certainly have sadly fallen off when those who stay at home have neither gratitude nor admiration for those who shoulder the musket, or are impressed less by the consideration that the soldiers are going to kill others than by the consideration that they are going to die themselves. There are things worth cherishing even in war; and the seeds of what is worst in it are sown not in camps, barracks, or forts, but in public meetings and newspapers and legislatures and in literature.

The New York *Times*, in an article which appears too late for us to make a detailed reply to it, protests strongly against the view we have recently taken of the Prussian attempt to impose on neutrals the duty of preventing the export of arms and munitions of war, and attributes to this view consequences hostile to the general cause of peace and humanity. Now, we hold it to be the duty of friends of peace to resist this or any similar change in international usage, because, though it would apparently help to bring hostilities to an earlier conclusion in the present war, it would, we sincerely believe, have a direct tendency to extend the area of war in every subsequent struggle—that is, to make every war a general war, wrapping the civilized world in flames; and for these reasons among others: Wars are, as we have said in the foregoing article, now emphatically peoples' wars and not sovereigns' wars. They are, therefore, carried on with a passion and fervor and with a general belief in their "holiness" never before seen. The consequence is that the number of men who, in any country which engages in hostilities in our day, keep their heads cool and retain firm hold of the legal principles applicable to the various incidents of the conflict, is increasingly small, and the tendency to look at neutrals as wicked, heartless fellows, without conscience or bowels, increasingly and, we might add, alarmingly strong. We might, had we time, furnish numberless illustrations of all this from the struggle now raging in France. From this state of mind on the part of belligerents is gradually springing up the notion that neutrals are bound, when a war breaks out, not to look on and keep quiet, but to find out which side is in the right, or, as the phrase is, which is "defending the cause of progress and humanity," and sympathize actively with that. From this notion has issued the doctrine which Count Bernstoff brought to light in the late controversy with Earl Russell, that not only must the neutral sympathize with the right side, but must exercise towards it what he calls a "benevolent neutrality"—that is, in plain English, *lean* to it, and help it a little by restrictions placed on its own subjects to the detriment of the other belligerent. Now, accept this doctrine of "benevolent neutrality," together with the vagueness and increasing vagueness of the term "contraband of war," and we put, we do not hesitate to say, in the hands of any pair of powerful and unscrupulous belligerents the means of dragging every other nation into their quarrel. Arms and munitions of war happen in the case of the French to be the things most useful to them; but in other cases—such as that of the Confederacy, for instance—clothing, corn, leather, hospital stores might be far more important in prolonging the war than rifles and powder. In fact, in the present state of military science, and with the present composition of armies, "contraband of war" might be made to include, if only the feelings or convenience of the belligerents were to be consulted, the great bulk of the articles of modern commerce. We cannot go any further into the subject at present; but we may remark in closing that, as all readers of the *Nation* know, in opposing the Prussian demands in this matter, we are really arguing in direct opposition to our own hearty sympathies.

THE "COMIC PAPER" QUESTION.

THE death of *Punchinello* has furnished an occasion for the customary enquiry on the part of the serious press into the cause of the apparently insurmountable difficulty experienced by the people of the United States in the establishment of a truly comic paper. It is recorded of a patriotic member of the Committee of Ways and Means that—after hearing from the Special Commissioner of the Revenue an elaborate and strongly fortified argument which made a deep impression on the committee in favor of a reduction of the whiskey tax, on the ground that the then rate, two dollars a gallon, could not be collected—he closed the debate, and carried the majority with him, by declaring that, for his part, he never would admit that a government which had just suppressed the greatest rebellion the world ever saw could not collect two dollars a gallon on whiskey. A large portion of the public approaches the comic-paper problem in much the same spirit in which this gentleman approached the whiskey tax. The country has plenty of humor, and plenty of humorists. It fills whole pages of numerous magazines and whole columns of numerous newspapers with really good jokes every month. It supplies great numbers of orators, and lecturers, and diners-out with "little stories," which of their kind, which is excellent, cannot be surpassed. There is probably no country in the world, too, in which there is so much going on all the time of the fun which does not need local knowledge or coloring to be enjoyed, but will bear exportation, and be recognized as the genuine article in any English-speaking part of the world. Moreover, there is in the real American stories an amount of suggestiveness, a power of "connotation," to borrow a term from the logicians, which cannot be affirmed of those of any other country. A very large number of them are real contributions to sociology, and of considerable value, too. Besides all this, the United States possesses, what no other nation does, several professed jesters—that is, men who are not only humorists in the ordinary sense of the term, but make a business of cracking jokes, and are recognized as persons whose duty it is to take a jocose view of things. Artemus Ward, Josh Billings, and Mark Twain, and the Rev. P. V. Nasby, and one or two others of less note, are a kind of personages whom no other society has produced, and who certainly could in no other society attain equal celebrity. In fact, when one examines the total annual production of jokes in the United States, one who knows nothing of the past history of the comic-paper question can hardly avoid the conclusion that such periodicals would run serious risk of being overwhelmed with "good things" and dying of plethora. Yet the melancholy fact is that several—indeed, all that have been started—have died of inanition; that is, of the absence of jokes. The last one says it offered all the great humorists in the country plenty of work, and their own terms as to pay, and failed to enlist them, and the chance jokes apparently were neither numerous enough nor good enough to keep it afloat.

Now, what is the cause of this disheartening state of things? Why can the United States not have a comic paper of their own? The answers to this question vary, though of course not greatly. They are mostly given in the shape of a history, with appropriate comments, of the unsuccessful attempts made to establish comic papers: one went down because it did not sympathize with the liberal and humane movements of the day, and laughed in the pro-slavery interest; another, because it never succeeded in getting hold of a good draughtsman for its engravings; and another venture failed, amongst other mistakes, we are told, because it made fun of the New York *Tribune*. The explanation which finds most general favor with the public is that, while in England, France, and Germany "the great dailies" confine themselves to the serious treatment of the topics of the day, and thus leave room for the labors of *Punch*, or *Kladderadatsch*, or *Charivari*, in America all papers do their own joking; and, if it seems desirable to take a comic view of anything or anybody, take it on the spot in their own columns. Hence any paper which starts on a comic basis alone meets with rivals in all its sober-minded contemporaries, and comes to grief. The difficulty it has to contend with is, in short, very like that which the professional laundress or baker has to contend with, owing to the fact that families are accustomed to do their own washing and bake their own bread. And indeed, it is not unlike that with which professional writers of all kinds have to contend, owing to the readiness of clergymen, lawyers, and professors to write while doing something else. An ordinary daily paper supplies, besides its serious disquisitions, fun enough for one average household—sometimes in single jokes, and sometimes in the shape of "sparkle" or "spiciness" in grave articles. Often enough it is very poor stuff, but it amuses people, without turning their attention away from the sober work of life, which is the only way in which the vast body of Americans are willing to be amused. There is, or was, a low-comedy man in the *World* who certainly jokes well enough for any comic paper; and somebody who, a few weeks ago, in the *Tribune*, burlesqued the *World's* foreign news, might do as good work as ever appears in *Punch;* but then these men have here, what they would not have in London, a chance of letting off a joke once a day, and six or seven jokes a week is more than any comic paper is willing or able to take from any one contributor, partly owing to the need of variety in the vein in a paper given wholly to humor, and partly owing to want of space. Anybody, therefore, who has humor for sale finds a readier market among the dailies or magazines, and a far wider circle of readers, than he would in any comic paper. The charge that our comic papers have generally opposed the friends of liberty and progress—that is, the most intelligent and appreciative portion of the public—is quite true, but it does not go far to account for their failure. *Punch* has done this steadily ever since its establishment, without serious injury. No good cause has ever received much backing from it till it became the cause of the majority, or indeed has escaped being made the butt of its ridicule; and we confess we doubt whether "the friends of progress," using the term in what we may call its technical sense, were ever a sufficiently large body, or had ever sufficient love of fun, to make their disfavor of any great consequence. Most people in the United States who are very earnestly enlisted in the service of "a cause" look on all ridicule as "wicked," and regard with great suspicion anybody who indulges in it, whether he makes them the object of it or not. They bore with it, when turned against slavery, from one or two distinguished humorists, because its effectiveness was plain; but we doubt whether any man who had the knack of seeing the ludicrous side of things ever really won their confidence, partly owing to their own natural want of humor, and partly to their careful cultivation of a habit of solemnity of mind as the only thing that can make an "advanced" position really tenable, to say nothing of comfortable. The causes of all successes as of all failures in the literary world are of course various, and no doubt there is a good deal of truth in all that has been said in solution of the comic-paper problem. American humorists of the best class can find something better or more lucrative to do than writing for a comic paper; while the poor American humorists, like the poor humorists of all countries, are coarse and vulgar, even where they are not stupid.

But there is one striking difference between American society and those societies in which comic papers have succeeded which not only goes a good way to explain their failure here, but puts a better face on some of their efforts—such as their onslaughts on the friends of progress—than they seem to wear at first sight. To furnish sufficient food for fun to keep a comic paper afloat, a country must supply a good many strong social contrasts for the professional joker to play upon, and must have a large amount of reverence for social distinctions and dignities for him to shock. Two-thirds of the zest with which foreign comic papers are read is due to the fact that they caricature persons or social circles with which the mass of their readers are not thoroughly familiar, and whose habits and ways of looking at things they do not share or only partly share. A good deal of the fun in *Punch*, for instance, consists in making costermongers or cabmen quarrel with the upper classes, in ridicule of Jeames's attempts to imitate his master, of Brown's efforts to scrape acquaintance with a peer, of the absurd figure cut by the "cad" in the hunting-field, and of the folly of the city clerk in trying to dress and behave like a guardsman. In short, the point of a great number of its best jokes is made by bringing different social strata into sharp comparison. The peculiarities of Irishmen and Scotchmen also furnish rich materials to the caricaturist. He never tires of illustrating the blunders and impudence of the one, and the hot patriotism and niggardliness of the other. The Irish Highlander who denies, in a rich brogue, that any Irish are ever admitted into his regiment, and the cannie burgher from Aberdeen, who, on his return home from a visit to London, says it's an "awfu' dear place; that he hadna' been twa oors in the toon when bang went saxpence," are types which raise a laugh all over the United Kingdom, and all because, again, they furnish materials for ludicrous contrast which everybody is capable of appreciating. Neither the Irishman, Scotchman, nor Englishman, as such, can be made to yield much fun, if sketched alone. It is when ranged alongside of each other, and measured by the English middle-class standard of propriety, that they become entertaining. In a homogeneous society, like that of the United States, none of this material is to be found. The New Englander, to be sure, furnishes a type which differs from the Middle-State man or the Southerner or Westerner, but none of them differs enough to make him worth caricaturing. His speech, his dress, his modes of acting and thinking, so nearly resemble those of his neighbors in other parts of the country, that after the comic writer or draughtsman had done his best or his worst upon him, it would remain still a little doubtful where the joke came in. The Irishman, and especially the New York Irish voter, and his sister Bridget, the cook, have during the past ten years rendered more or less service as butts for caricaturists, but they are rapidly wearing out. They are not many-sided persons at best, and their characteristics have become associated in the American mind with so much that is uncomfortable and repulsive in domestic and political life, that it becomes increasingly difficult to get a native to laugh at them. It must be confessed, too, that the Irish in America have signally belied the poet's assertion, "Cœlum non animum mutant qui trans mare currunt." There is nothing more striking in their condition than the almost complete disappearance from their character, at least in its outward manifestations, of the vivacity, politeness, kindliness, comical blundering impetuosity, and doublesightedness, out of which the Irishman of the stage and Jo Miller's Irishman who made all the bulls, were manufactured in the last century. Of the other nationalities we need hardly speak, as the English-speaking public knows little of them.

The absence of class distinctions here, too, and the complete democratization of institutions during the last forty years, have destroyed the reverence and sense of mystery by shocking which the European comic paper produces some of its most tickling effects. Gladstone and Disraeli figuring as pugilists in the ring, for instance, diverts the English public, because it gives a very smart blow to the public sense of fitness, and makes a strong impression of absurdity, these two men being to the English public real dignitaries, in the strict sense of the word, and under the strongest obligations to behave properly. But a representation of Grant and Sumner as pugilists would hardly make Americans laugh, because, though absurd, it would not be nearly *so* absurd, or run counter to any so sharply defined standard of official demeanor. The Lord Chief-Justice playing croquet with a pretty girl owes nearly all its point, as a joke, to the popular awe of him, and the mystery which surrounds his mode of life in popular eyes; a picture of Chief-Justice Chase doing the same thing would hardly excite a smile, because everybody knows him, and has known him all his life, and can have access to him at any hour of the night or day. And then it must be borne in mind that Paris and London contain all the famous men of France and England, and anybody who jokes in them is sure of having the whole public for an audience; while the best New York joke falls flat in Boston or Philadelphia, and flatter still in Cincinnati or Chicago, owing to want of acquaintance with the materials of which it is composed. We might multiply these illustrations indefinitely, but we have probably said enough to show any one that the field open to the comic writer is very much more restricted than that in which his European rival labors. He has, in short, to seek his jokes in character, while the European may draw largely upon manners, and it is doubtful whether character will ever supply materials for a really brilliant weekly comedian. Its points are not sufficiently salient.[*] The American comic papers have evidently perceived the value of reverence and of violent contrast for the purposes of their profession, and this it is which leads them so constantly to select reformers and reform movements as their butts. The earnest man, intensely occupied with "a cause," comes nearer to standing in the relation to the popular mind occupied in England by the aristocrat or statesman, than anybody else in America. The politician is notorious for his familiarity with all comers, and "the gentleman" has become too insignificant a person to furnish materials for a contrast; but the progressive man is sufficiently well known, and sufficiently stiff in his moral composition, to make it funny to see him in a humorous tableau. The fun thus procured, however, it must be admitted, has at best been very poor, and has not paid, and most probably never will.

ENGLAND.

LONDON, Dec. 9, 1870.

THE ominous cloud which darkened our prospects when I last wrote to you has passed away—for the present, at least. We are not to have a repetition of the Crimean war. Whether the danger is entirely avoided or only postponed is more than can be said with perfect confidence; but, at any rate, we are relieved for a time from a danger which few of us could contemplate with equanimity. We have, indeed, received a slight shock from a different quarter. General Butler has succeeded in annoying the British lion; and the President's address, so far as it is at present understood, is not calculated to calm our feelings. I shall not, however, dwell upon that matter beyond saying that, as it appears to me, you have the power of bringing about a settlement of the question if you choose. Of course, it is easy to press upon us demands with which we could not in honor comply; but I am convinced that there is a very sincere desire on this side of the water to settle the *Alabama* claims in a manner which would be satisfactory to all parties.

I pass from such topics to a question which has already become rather out of date here, but which has still a certain interest. The first school-board elections have taken place in London since I wrote to you last. A great deal had been said about the matter, and the whole election appeared to be in so chaotic a state that it was difficult to make any confident predictions. Two or three results, however, have come out very plainly. The first point upon which the Liberal press have thought it right to insist was the success of the first experiment in secret voting. There were a few little hitches in the machinery, but such as can easily be rectified on a future occasion. I cannot, however, say that I regard this experiment as of much importance. Everybody knows who has seen an election in America or, indeed, in France, that a large number of votes may be polled very easily without the confusion and excitement attendant upon our clumsy, old-fashioned system. There is no need for collecting all the roughs in a big town round the hustings to hustle respectable voters and drink unlimited beer. We have now learnt that fact by experience. More votes were probably taken in London than ever were taken before, and without the least trouble. The more serious question remains, whether the ballot in England can be made an efficient instrument for resisting intimidation and corruption and, at the same time, be kept free from fraud. Its advocates claim those advantages in the strongest language, and, of course, urge that this experiment raises a presumption in their favor. This, however, may be disputed. There was a very lively interest in the results of the election, but the interest was not of that kind which would encourage either corruption or intimidation. The candidates did not spend much money, and, to use the electioneering slang, the screw was not put on. In this respect, therefore, the result was negative. There were no serious complaints, but we are scarcely in a position to say that the balloting machinery has proved itself capable of meeting the ingenious devices which will doubtless be elaborated in due time by politicians of the lower order.

Other results were far more remarkable. The board includes, as might be expected, a great variety of members. There are representatives of the Church of England, of the Dissenters, of the Roman Catholics, and of nearly every shade of opinion. There are, I am glad to say, several men of more than ordinary claims to respect. Prof. Huxley, for example, Lord Lawrence, Mr. W. H. Smith (the successful rival of Mr. Mill at Westminster, but a very able and excellent man, in spite of his conservatism), Mr. Rogers, one of the most energetic and distinguished of the Liberal clergy, Dr. Barry, an eminent schoolmaster, and other well-known names, appear amongst the successful candidates. The chief interest, however, centred upon the ladies and the workingmen. Three ladies stood: Miss Garret came in not only at the head of the poll in her district, but so far ahead as to receive (if I remember rightly) between three and four times as many votes as Prof. Huxley, who was second; Miss Emily Davies was also at the head of the poll, by a very large majority, in another district; and Mrs. Grey, though she failed of success, only failed by a very narrow margin. The ladies, in short, won a triumph beyond the warmest hopes of their supporters. The workingmen, on the other hand, suffered an equally crushing defeat. Some of the best-known representatives of their class were nominated, and yet, in almost every district, they were hopelessly beaten. One only was elected, and very few even approached success.

This fact is curious, and the more so as it might be supposed that the same party would generally be in favor of both. A partial explanation might, perhaps, be suggested in the fact that the ladies commanded by far the most effective electioneering apparatus. They had enthusiastic supporters and energetic committees, and their cause was thoroughly worked. Their sex supplied them with an excellent advertisement. There was a certain curiosity excited by the novelty of the proceeding. Moreover, Miss Garrett is, perhaps, the ablest member of her party, and Miss Davies and Mrs. Grey both also distinguished themselves by very excellent speeches and addresses. Without indulging in clap-trap, they showed a business-like and reasonable tone which told strongly in their favor. On the other hand, the workingmen were less known and were less able to secure such active support. They could not advertise or hold meetings to the same extent, and found a certain difficulty in getting their names perfectly before the constituents. After every allowance has been made for such circumstances, I think that two things are pretty evident. The first is, that women have made a greater stride toward a general recognition of their rights than was generally thought possible. I should think it highly probable that they will obtain the parliamentary suffrage before long, though I will frankly confess that the prospect does not move me to any lively sense of exultation. My second conclusion is that English workingmen are still far from being roused to that state of political zeal which would lead them to overlook petty jealousies and elect members of their own class. It is still true, though I shall not attempt to decide how far it is a cause for congratulation or regret, that, on the whole, in spite of a good deal of talk to the contrary, they rather prefer to be represented by people of higher social position; or, at any rate, their feeling is not strong enough to overcome the electioneering advantages always attaching to a certain degree of wealth and position. No workingman candidate has yet reached Parliament, and there must be a great change of sentiment before they will reach it in any numbers. I refrain from discussing the causes of this phenomenon, which is, perhaps, not very singular after all, except as it disappoints the anticipations of some of the more ardent reformers. The Radical feeling does not seem to have been anywhere very strong. In Westminster, the whole Conservative ticket was elected, owing, probably, to the better organization of the party, and two very good reformers, Sir Chas. Trevelyan and Lord E. Fitzmaurice, were rejected. Still the school-board is in many ways so strong, and, in particular, is so free from the element of parish politics, that I think we have every reason to congratulate ourselves on the result.

I must add a few words on a disagreeable topic, which I have no wish to discuss at length in your pages. A gentleman writing to you from Dublin is angry with me for speaking of the "hysterical and shrieking declamation" used by "some of the best and most eminent of my countrywomen" in regard to the Contagious Diseases Acts. He is afraid that I shall "not think it worth while" to mention the defeat of Sir H. Storks at Colchester, which was owing to the exertions in this respect of Mrs. Josephine Butler. And he says that Mrs. Butler is a lady of many good qualities, the daughter of an admirable father, and wife of a distinguished husband. Now, as to the hysterics and shrieks, I can only say that I think those terms very applicable to most of the female eloquence I have read upon the subject, though I forget having used them, and I am pretty certain that I did not apply them to Mrs. Butler's remarks. That Sir H. Storks lost the election for Colchester because he was an eminent supporter of the Acts is perfectly true. It proves, what is far from surprising, and is, indeed, pretty notorious, that there is a strong popular feeling against the Acts. When such a feeling exists, a great many people are apt to plunge into sentiment without weighing arguments, and to fall into hysterical shrieking in consequence. Therefore, the case of Colchester, to which that of Newport, in the Isle of Wight, may now be added, hardly disproves my statement. When there is a popular agitation in the United States about liquor laws, or woman's rights, or any other exciting subject, you must be far more fortunate than we are if you have not to listen to a good deal of hysterical declamation. I would not speak disrespectfully of Mrs. Butler, who, as I have reason to know, has many admirable qualities; but neither those qualities, nor her connection with praiseworthy people, prevents me from thinking that, in this instance, she has allowed her generous instincts to overpower her logical faculties.

The state of the case, as I understand it, is this: The Acts in question have naturally diminished a most fearful disease. Sir. H. Storks succeeded at Malta in all but stamping it out under favorable conditions; and the experiment, though less systematically tried in England, has produced unequivocal sanitary improvement. It is further asserted by most qualified observers that the Acts have diminished vice and been the means of restoring a very large number of fallen women not only to health, but to virtue. It is quite possible that these statements may be met by fair argument. Dr. Chapman, for example, of the *Westminster Review*, has put the opposite side of the case with great force. His arguments deserve, at least, attentive consideration; possibly, they should carry conviction. But the ladies of whom I was speaking systematically despise facts. They prefer to talk about the rights of British subjects, meaning the right to spread a deadly disease; the wickedness of interfering with a providential punishment of vice, which would be an almost equally good reason for objecting to vaccination; and the atrocity of recognizing prostitution, when it is recognized just as picking pockets is recognized, by putting it under certain restrictions. When I read such arguments, sometimes spiced with texts from Scripture, and sometimes interspersed with the wildest revolutionary views of marriage, I am not afraid to call them hysterical cant, even though they are prompted by a really generous, if ignorant, instinct. I do not argue as to the substantial merits of the case. Whatever my own opinion, I hope that I can do justice to any reasonable opponent; but, even if the acts are utterly wrong, it will not be the first time that a good cause has been advocated on very contemptible grounds.

Correspondence.

THE LEE PEDIGREE.

TO THE EDITOR OF THE NATION:

SIR: In your journal for April 8, 1869, I briefly reviewed a genealogy of the Lee family of Virginia, pointing out the fact that the English portion was entirely without authority. The last number of the *Herald and Genealogist* (London, October, 1870), edited by the well-known antiquary, John Gough Nichols, Esq., contains a notice of this Lee Genealogy. The writer therein expresses the same opinion of the book that had been given in your columns, but he gives also the true pedigree of the American Lees, being the same which I referred to in my review.

There can be hardly a doubt that Colonel Richard Lee, the emigrant to Virginia, was the seventh son of Sir Robert Lee of Hulcott, and younger brother of Sir Henry Lee of Quarrendon and Ditchley, Bart. Sir Robert Lee died at Stratford-Langton, County Essex, and was buried at Hardwick, August 20, 1616, aged 78.

The will of the emigrant begins: "I, Col. Richard Lee, of Virginia, and lately of Strafford-Langton, in the County of Essex." He named his plantation Stratford, and the pedigree lacks only a little care in identification to be as satisfactory as could be desired.

This particular family of Lee has been distinguished. To it belonged Sir Henry Lee, Knight of the Garter in Queen Elizabeth's time, own cousin to the emigrant; and in the line of Sir Henry, the fifth baronet was made Earl of Litchfield in 1674.

The arms of the family of Lee, of Lee Hall, were argent, a chevron between three leopards' heads sable. Benedict Lee, of Quarrendon, used this coat, but his son Richard, in 1472, used argent, a fesse between three crescents sable. His son, Sir Robert Lee, grandfather of the emigrant, had a special grant, in 1513, of the following coat: argent, on a fesse azure between three unicorns' heads erased sable, as many fleurs-de-lys or. Either of these coats may be used by the descendants of Col. Richard Lee, but that bearing the three crescents has been most used by the family in England.

From the preceding remarks, it will be seen how unfortunate the historian of the family was in giving the first fifty pages of his book to notes on the Lees of Cotton, who were in no way related to the emigrant. The coats of arms which embellish the cover and adorn sundry pages of his book unfortunately did not belong to the emigrant to Virginia. The "ancient genealogy, accompanied by an original coat of arms," which had "long slumbered among the old family papers of the compiler of this work," and of which "the authenticity is undoubted," proves only to have been a copy made in 1750 by officers of the Heralds' College. No doubt they made a true copy of their records, but so far as it interested any American, it might as well have been the pedigree of Sir Walter Raleigh. In short, the writer started on a false scent, and his time and money were entirely wasted.

Having balanced our account with the Lee family by giving them a valid claim to a more illustrious lineage than the one wrongly attributed to them, it cannot be unfair to repeat that such a blunder goes far to justify our disbelief in the claims of Southern genealogists. Here was a gentleman of good family, brother of a baronet, cousin of a Knight of the Garter, and yet even tradition seems to have ignored his hereditary pretensions. It is even probable that, in a century from his death, the family record was so obscured that his descendant in London obtains from the Heralds a pedigree of an alien family, to be transmitted to the bewildered eyes of the present generation. If such a thing be possible in a family so well known as that of Lee, what reliance can be placed on the traditions of families obscure from the time of their emigration or deportation? Bishop Meade, in his valuable book, has shown how imperfect before the late rebellion were the local records in Virginia. Undoubtedly, the prosecution of the war caused a further destruction of important information, but whatever remains should be gathered up and published, and such a work should be the first care of any and every Southern Historical Society.

W. H. W.

Notes.

LITERARY.

THE German press has, since the war assured the repossession of Alsace and Lorraine, been prolific of pamphlets in defense of annexation both on historical grounds and on grounds of present right and expediency. Whoever wishes to study the question more carefully than can be done in the newspapers, will do well to consult some or all of the publications whose titles follow: (1) "Elsass und Lothringen sind und bleiben unser," by Wolfgang Menzel, whose very positive thesis is maintained in an interesting manner, both with reference to the past and the future; (2) "Elsass und Lothringen," considered from a geographico-statistical and historico-political point of view; (3) a pamphlet with the same title, by Adolph Schmidt, Professor of History in the University of Jena, showing how the two provinces were lost to Germany, which has met with so much favor as to have reached a third and enlarged edition; (4) "Elsass und Lothringen und ihre Widergewinnung für Deutschland," by Professor Dr. Adolph Wagner, already in its fourth edition, revised and enlarged; (5) "Elsass—eine Deutsche Provinz," by Wilhelm Maurenbrecher, Professor of History in the University of Königsberg, a brief but remarkable contribution to the controversy, calculated for popular reading; (6) "Der deutsche Name Germanen und die ethnographische Frage vom linken Rheinufer," by the librarian of the Royal Academy of Münster, Prof. Dr. Watterich, which argues the Celts entirely away from the Rhine's banks; (7) "Die Grenze zwischen Frankreich und Deutschland," by Rudolph Usinger; (8) "Deutschlands strategische Grenze gegen Frankreich," by Franz Maurer; (9) "Was fordern wir von Frankreich?" by Heinrich von Treitschke. All these can be procured in this city at a trifling cost of Mr. E. Steiger, from whose *Monatsbericht* for November and December we have gleaned them.

—The intellectual bond between Alsace and Lorraine and the rest of Germany was well illustrated the other day in our columns by Dr. von Holst. The towns and cities rendered prominent by the war can lay claim by turns to each of the great names in literature which he enumerated. It was, for instance, in the Benedictine cloisters at Weissenburg that Otfried composed his *Evangelien-Harmonie*, which ranks as the oldest specimen of German poetry. Hagenau had for its poet Reinmar der Aeltere in the days when Gottfried was composing his famous epics in Strassburg, where also wrote Sebastian Brant and Thomas Murner, the satirists, where Gutenberg conceived the idea of movable types, and Goethe sketched out his *Faust*. Finally, it was in Colmar that Pfeffel, the poet and fabulist and satirist, showed how superior the mind may be to the terrible affliction of an almost life-long blindness. Pfeffel's name has been perpetuated in the "Pfeffel-Album" published by another Alastian poet, now deceased, Theodor Klein. The first part of this collection contains the poems of Alsatians not living at the time it was made—seven in number: the second, of those still living—thirty-three in number. Though destitute of any national expression, or any allusion to the Fatherland, these productions have all the marks of the German character, as if the French had never occupied the country.

—The reality of the acquisition of Alsace for Germany appears from the concurrent appeal of upwards of fifty towns and cities of the Confederation for contributions in money and books to re-establish the Strassburg Library, of which, says the address, "absolutely nothing has been saved." The manuscripts and specimens of early printing are, of course, irreplaceable, but the needs of the present time can, perhaps, be as well provided for by a new foundation as by the old. Mr. Trübner, 60 Paternoster Row, London, will receive any offerings entrusted to his care, and furnish whatever additional information may seem desirable. The aid of which this country is capable is, of course, chiefly pecuniary; yet a collection, respectable in numbers and intrinsically valuable, might easily be made up by our publishers and, from their surplus, by our great libraries. We have, indeed, a special interest in establishing a library which will be singular among others of the first rank in Europe, in being deprived of the enormous advantage of antiquity, and with which, therefore, we may properly compare the libraries instituted here during the present century, or within the last hundred years.

—With whatever feelings such a movement on the part of Germany may be regarded by the French, they will, it is to be hoped, some day acknowledge the humane endeavors of the Women's Associations (Frauenvereine) to assuage the sufferings of the sick and wounded of both nations, on both sides of the Rhine. The oldest of these, according to Dr. Hahn ("Die deutschen Frauenvereine unter dem rothen Kreuze"), dates back not further than the close of the Crimean war; the largest is the Vaterlandischer Frauenverein, instituted by Queen Augusta in November, 1866, at the close of the war with Austria. The latter has already 300 branch associations in Prussia, and its regulations are substantially adopted by the other societies not directly connected with it. They all have a double mission: in war, the care of the sick and wounded in the field; in peace, to meet such exigencies at home as epidemics, drought, floods, fires, and also to train nurses for the sick. Their field is thus very wide, and their activity extends even to the building of hospitals, procuring work for the poor, taking charge of children exposed to demoralizing influences, and other forms of social providence. Besides good character, a woman, to become a member, needs only to pay about sixpence a month to the fund of the association, and furnish some sort of needlework. Honorary members pay money only. Without stopping to ask whether French civilization could produce such a system of private benevolence, we may note here the appeal of a patriotic citizen of Berlin—Mr. J. J. Sturz—to his countrymen to prepare food for the relief of the inhabitants of Paris when the city shall have been reduced by hunger—an event of which Bismarck has given due and, we believe, humanely-intentioned warning.

—Herr Wagner, with his "Judenthum in der Musik," has had an imitator in the genial Fritz Reuter, from whom one would have expected more toleration, and, with Wagner's experience before him, we might add, circumspection. Having a speech to make at a recent patriotic festival at Eisenach, he must go out of his way to denounce the Jewish element in literature, singling out Heine as his especial target, calling him a Jewish boor (*Judenbengel*), and even holding up his poem of the "Two Grenadiers" as proof that the author was a worshipper of Napoleonic ideas. There is in such an argument a singular lack of that humor for which the author of "In the Year '13" is justly celebrated, and which ought to have enabled him to appreciate the sentiment of the poem in question. However, he has brought down on himself a severe castigation at the hands of a highly cultivated Jewish advocate, Fr. Wachtel, who makes a pamphlet of "An Open Letter to Dr. Fritz Reuter." It appears that this is not the first time the Platt-Deutsch novelist has improved his chance at public meetings to make attacks on others.

—One of the best caricatures that the Franco-Prussian war has produced is that in which Napoleon is seen fleeing from some invisible pursuer down a narrow street leading to a gateway flanked on the further side by an Orleanist and the Republic, each ready to dispatch him; with the legend from Tell's soliloquy "By this way he must pass" (Durch diese hohle Gasse muss er kommen). They order these matters differently in Paris, where, says a correspondent, the designs are, almost without exception, coarse, indecent, hideous, and witless. Napoleon appears in them in an infinity of degrading conditions and attitudes, it being reserved for Cham, in the *Charivari*, to exhibit something of the German humor without ferocity—as where, for instance, he represents "the crowning of the edifice:" a fortress, Sedan, overshadowed by a Prussian elm. On the once fashionable boulevards from the Madeleine to the Chateau d'Eau, now thronged with venders of all sorts of wares, one hears cried, "The Shameful Life, Crimes, Orgies, and other Unquestioned Deeds of Mr. Louis Bonaparte," all for two sous; also the life of "Mr. Jerome Napoleon" and of the "femme Bonaparte," with promises of a sequel; and worse yet, according to the correspondent of the Cincinnati *Gazette*, who confirms the Italian observer we have been quoting:

> "The most obscenely gross and grossly obscene books are exposed upon the boulevards for sale, and cried by women and children on the streets. I may not even give the title of these vile publications; but they cannot be left without mention by any one who cares to be a faithful chronicler of the crisis and its causes. And I will say that in the concoction of some of these caricatures and pamphlets, the author has descended to the very depth of loathsome indecency. I have seen caricatures of the Empress today which I am sure would not be tolerated on the streets of any city of Turkey or Hindostan. In the smuttiest shop window of the most unfrequented streets of the most licentious cities of Italy or Spain, you will see nothing so loathsome, vile, and brutal as the pictures I saw, one hour ago, dealt out to merry purchasers on the boulevard, by an equally merry young woman of about eighteen years, and of a pretty and unblushing face. . . . And this is not an exceptional spectacle. It is to be seen from one end to the other of the boulevards, and of a dozen other of the most frequented thoroughfares. The best dressed men and women join the crowd that presses up to gaze long and with an admiring relish upon these filthy caricatures."

The contrast between July and November is not greater in this altered license of the boulevards by day than when, no longer illuminated at nightfall, they resound with the noise of street musicians; and "one passes occasionally an entire family, shivering with cold and hunger before two candles set on the pavement, and chanting the Marseillaise in heart-distressing tones."

—The Panslavic idea, as Russia holds it, is to be carried out with the aid of Serbs, Bosnians, Bulgarians, and Montenegrins against Turkey; of Serbs, Slavonians, Croats, Slovaks, and Ruthenians against the Hungarians; of Galician Ruthenians against the Poles; and of Czechs, Winds, and Slovens against the Germans of Austria. It may be worth while to elucidate the nature of the national, or rather linguistic, tie binding with each other and with Russia all these various branches of the great Slavic family of peoples—considering how often observers of European politics, unfamiliar with the Slavic idioms, are perplexed by the vague and discrepant statements concerning these matters in American and English journals. And how widely these statements occasionally differ, the following example will show: Speaking of the Slavic race, the writer of a very able, but very partial, pro-Russian letter to the *Tribune*, a few weeks ago, made this statement: "Its bond of unity is language. The sailors of Ragusa converse in the mother-tongue with the fishermen of Archangel, and the inhabitants of Prague with the people of Moscow." This assertion was, two days later, characterized as "decidedly incorrect" by another writer in the same paper, who boldly asserted that "the sturdy Dalmatian sailor has no more knowledge of the Russian vernacular, as spoken at Archangel, than a New Yorker has of the idiom of any Indian tribe on our Western frontier," and "as to the possibility of a conversation between an inhabitant of Prague and a Muscovite," referred "to the historical fact, that at the convention of all Sclavonic races, held at that very Prague in the summer of 1848, the delegates had to make their glowing 'Pansclavonic' speeches in German."

—Were we now to pass judgment in this controversy to the effect that the "historical fact" concerning the Panslavic Congress of Prague is correct, but that the statement preceding it is not only "decidedly incorrect," but perfectly absurd, we should only add a bare assertion to other assertions as unreservedly made. Let us, therefore, bring the question before our readers themselves by a juxtaposition of words and grammatical forms belonging to the foremost languages of the Slavic world—the Russian, the Polish, the Czechish or Bohemian, and the Serbian—beginning with a comparison of the first-named language, which is the vernacular spoken at Archangel, with the last-named, a dialect of which is the idiom of the Slavic Dalmatian. Here, to begin with, are the personal pronouns of the Russian, the vowels to be pronounced as in Italian: *Ya*, I; *ti*, thou; *oh*, he; *ona*, she; *ono*, it; *mi*, we; *vi*, ye; *oni*, they, masc. and neut.; *onye*, they, fem. The corresponding words in Serbian are: *Ya, ti, on, ona; ono, mi, vi, oni* (masc.), *one* (fem.), *ona* (neut.). The Russian numerals are these: *Odin* (m.), *odna* (f.), *odno* (n.), one; *dva*, two; *tri*, three; *tchetire*, four; *pyat'*, five; *shest'*, six; *sem'*, seven; *osm'* or *vosem'*, eight; *deviat'*, nine; *desyat'*, ten; *odinnadtzat'*, eleven; *dvadtzat'*, twenty; *sto*, hundred; *tisyatcha*, thousand. The corresponding Serbian numerals are: *Yedan* (*yedna, yedno*), *dva, tri, tchetiri, pet, shest, sedam, osam, devet, deset, yedanaest', dvadeset, sto, hilyada* or *tisutcha*. The Russian declines the singular of *ruka*, hand, thus: nom., *ruka;* gen., *ruki;* dat., *rukye;* acc., *ruku;*

(voc. like nom. ;) instrumental, *rukoyu ;* locative, *rukye.* The singular of the same noun in Serbian is *ruka, ruke, rutzi, ruku, ruko, rukom, rutzi.* We may add that the Polish and Czechish equivalents for all these words show but very slight deviations.

—Let us now compare the Serbian verb with the Polish : The indicative present of the Serbian *tchitati,* to read, is this : *Tchitam, tchitash, tchita, tchitamo, tchitate, tchitahu ;* of the Polish *czytac'* (pron. *tchitatch*) : *Czytam, czytasz, czyta, czytamy, czytacie, czytaja' ;* of the Serbian *vidyeti,* to see : *Vidim, vidish, vidi, vidimo, vidite, vide ;* of the Polish *widziec' : Widze', widzisz, widzi, widzimy, widzicie, widza';* of the Serbian *biti,* to be : *Yesam, yesi, yest, yesmo, yeste, yesu ;* of the Polish *byc': Jestem* (pron. *yestem*), *jestes', iest, jestes'my, jestes'cie, sa'.* The indicative future of the last-mentioned Serbian verb is : *Budem, budesh, bude, budemo, budete, budu ;* of the corresponding Polish : *Be'de', be'dziesz, be'dzie, be'dziemy, be'dziecie, be'da'.* The past tenses are somewhat less similar. Thus we find for the Serbian *tchitah* (I was reading), *tchitashe, tchitashe, tchitasmo, tchitaste, tchitahu,* the Polish *czytalem, czytales', czytal, czytalis'my, czytalis'cie, czytali.* A comparison of the Polish and Czechish adjectives may complete our circle of grammatical illustrations: *Silny,* robust, in Polish is declined thus: *Silny, silnego, silnemu,* etc. (Lat. *robustus, robusti, robusto,* etc.) ; its feminine thus : *Silna, silnej* (*j=y*), *silnej,* etc. (*robusta, robustæ, robustæ,* etc.) ; its neuter thus : *Silne, silnego, silnemu,* etc. (*robustum, robusti, robusto,* etc.) ; and the corresponding forms in Czechish are : *Silny, silného, silnému,* etc. ; *silná, silné, silné,* etc. ; *silné, silného, silnému.*

—All this will suffice to show how closely the various Slavic languages are related to each other, and how little difficult it would be, for instance, for the Czech of Bohemia or Moravia, when speaking slowly and carefully selecting his words, to make himself understood on most subjects in common life by the inhabitants of Warsaw, Agram, Belgrade, Moscow, or Archangel. A similarly executed comparison of the Romanic languages will easily prove that the difficulties of an Italian or Spaniard speaking his own language in Paris, Lisbon, or Rio de Janeiro would be nearly the same, neither much less nor much greater. And we may add that it would be just as useless a task for a learned Muscovite to address in Russian an assembly of Poles, Czechs, Croats, or Montenegrins, as it would be for a Brazilian priest to deliver Portuguese sermons in the churches of Naples, Toulouse, or Toledo. This explains why the Congress of Prague, almost all the members of which were possessed of sufficient fluency in German, while but with difficulty comprehending each other's tongue, were compelled to use the language of their opponents as their common medium of deliberation on Slavic affairs. It also shows that a universal union of the Slavic nations under the rule of the Czar would be no less a political monstrosity than a union of France, Italy, Spain, Portugal, Mexico, and all Central and South America under the sceptre of a common despot.

POPULAR WORKS ON OLD TESTAMENT SUBJECTS.*

Dean Stanley's work on the "History of the Jewish Church" "contains the substance of lectures delivered from the chair of ecclesiastical history in the University of Oxford." In judging its merits we must bear in mind that the author disclaims "any pretensions to critical or linguistic research, and would have his book regarded not as a history, but as *lectures.*" And considered in this light, it will be found to offer much more than it promises, and to deserve forgiveness for what, in a connected narrative, pretending to be exhaustive, we should call want of completeness or of critical precision. In fact, it is almost a history of ancient Israel, both complete and critical. That it is neither entirely complete nor entirely critical is not attributable to a lack of diligence in elaboration or of erudition—for the elaborate finish of the whole, and the scholarship displayed in every part, are fully worthy of the Dean's reputation—but to the peculiar limitation of the subject, and to the peculiar standpoint occupied by the author as investigator of religious history. His subject is not the Jewish people but "the Jewish Church," and his critical research confines itself within boundaries narrowly drawn by reverence for ecclesiastical traditions. For this reason many of the most important narratives presented us in these "Lectures" are marked by an indefiniteness and vagueness which must often leave the reader in doubt whether the author discourses on facts or on legends. His tone is throughout too homiletic and apologetic, and his diction too richly laden with poetico-religious ornaments, to allow the belief that he did *not* regard it as dangerous "to search the Jewish records as we should search those of other nations." The work reads as if written for edification rather than for historical enlightenment and instruction. Yet, like all the Dean's productions, it abounds in vivid illustrations, drawn from a vast store of knowledge, and in felicitous remarks of every kind. The following passages, embracing the narrative of the passage of the Red Sea, may serve to illustrate the tenor, and both the merits and defects, of the "Lectures":

> "The Israelites were encamped on the western shore of the Red Sea, when suddenly a cry of alarm ran through the vast multitude. Over the ridges of the desert hills were seen the well-known horses, the terrible chariots of the Egyptian host : 'Pharaoh pursued after the children of Israel, and they were sore afraid.' . . . And in that terror and perplexity the sun went down behind the huge mountain-range which rose on their rear, and cut off their return to Egypt ; and the dark night fell over the waters of the sea which rolled before them and cut off their advance into the desert. So closed in upon them that evening. Where were they when the morning broke over the hills of Arabia ? Where were they, and where were their enemies ? They stood in safety on the further shore, and the chariots and the horsemen and the hosts of Pharaoh had vanished in the waters. . . . They had passed in that night from Africa to Asia ; they had crossed one of the great boundaries which divide the quarters of the world. . . . Behind the African hills, which rose beyond the Red Sea, lay the strange land of their exile and bondage—the land of Egypt, with its mighty river, its immense buildings, its monster-worship, its grinding tyranny, its overgrown civilization. This they had left to revisit no more. . . . . From slaves they had become free ; from an oppressed tribe they had become an independent nation. . . . The Passage, as thus described, was effected not in the calmness and clearness of daylight, but in the depth of midnight, amidst the roar of the hurricane which caused the sea to go back—amidst a darkness lit up only by the broad glare of the lightning as 'the Lord looked out' from the thick darkness of the cloud. . . . We know not, they knew not, by what precise means the deliverance was wrought : we know not by what precise track through the gulf the passage was effected. We know not, and we need not know ; the obscurity, the mystery, here as elsewhere, was part of the lesson. 'God's way was in the sea, and His paths in the great waters, and *His footsteps were not known.*' "

Prof. Plumptre's "Biblical Studies" are mostly reprinted—"with hardly any alteration"—from *Good Words* and the *Sunday Magazine.* Though much more strictly critical than Dean Stanley's "Lectures," they are popular productions, as the author's wish in writing them was to address himself "to the wider circle of intelligent readers of the Bible rather than to the narrower circle of scholars." Of Old Testament subjects—the main subjects of the volume—they embrace the following: "The Lord of Sabaoth," "The Most High God," "Shiloh," "The Tree of Life," "Caleb," "The Revolt of Absalom," "The Earthquake in the Days of Uzziah," "The Psalms of the Sons of Korah," "The Authorship of the Book of Job," "The Old Age of Isaiah," "Three Generations of Jewish Patriotism," "The Babylonian Captivity," and "The Last of the Prophets." And the scholarship which the author brings to bear upon these subjects is as comprehensive and solid as his ability to popularize "the more interesting results of the enquiries" is consummate. The critical value of his studies, however, varies according to the scope his ecclesiastical prepossessions allow his criticism. Thus the essay on Job, in which he reaches the conclusion that "in the Book of Job we have the result of that short contact between the religion and culture of the Hebrew and the Arabian branches of the Semitic family which took place during the reign of Solomon," is replete with sagacious and ingenious remarks—though it may fail conclusively to settle the question at issue—while the following essay on Isaiah piles up paltry proofs against overwhelming evidence to vindicate for that prophet the authorship of "the last twenty-six [twenty-seven] chapters of the book that bears his name."

Mr. Cheyne's "Book of Isaiah" deals with its subject in a much more genuine spirit of critical enquiry, and in reference to the last twenty-seven chapters of that collection ably develops the opposite view to that defended by Prof. Plumptre. To the doing of this, which, in fact, has been exhaustively done so many times, he does not devote too much space in his introduction, justly relying on the succinct but well-executed prefatory remarks and explanatory notes to the various divisions and subdivisions of his "chronologically arranged" text. These remarks and notes are, it is true, far from forming an exhaustive commentary, and it need hardly be said that they do not offer conclusive support to every solution presented by the author ; but they cannot fail greatly to facilitate for students and teachers the understanding of the best attempts made by scholars to solve the historical and chronological problems connected with one of the richest and, in every respect, most interesting Biblical books. Popular in the best sense of the word, Mr. Cheyne's production is yet marked throughout by evidences of extensive learning and independent research, and we have no hesitation in declaring it a very valuable contribution to the rich branch of literature to which it belongs.

"Studies in Bible Lands. By Rev. W. L. Gage, Editor of Ritter's 'Comparative Geography of Palestine,' etc., etc." With Seventy-two Illustrations. Boston: American Tract Society. 1870.

Bishop Wilberforce's "Heroes of Hebrew History," a collection of sketches reprinted—with one exception—from the pages of *Good Words*, does not pretend to offer any new results of investigation, and betrays the learning of the author only in the skilful and easy handling of his subject. The heroes chosen—twelve in number—all belong to the oldest period of the Hebrew annals, from Abraham to Elisha. Moving within the narrowest limits of Biblical tradition, the writer manages, nevertheless, to enliven his topics by observations full of originality, and by a racy diction, teeming with marks of spiritual freedom. Witness, for instance, his sketch of young Jacob, who, "thoughtful and given to anticipations of the future, eager to please the mother whom he loved, seeing an opportunity of securing what she had taught him that God meant him to possess, and so, with a meanness bred of a subtle intellect, of misleading affections, of a timid temper, and of a debased religiousness, tempted his brother to a sin by which he was himself to profit;" or of Jacob stealing away the blessing "as he had meanly purchased the birthright of the first-born. Here all the lines are darker. Rebekah is yet more visibly the tempter. Her son, more timid, perhaps less deceitful than herself, shrinks from the perfidy of abusing the darkened sight of his aged father. But she overbears his resistance. She has now persuaded herself that it is well to lie for God; that the great just God of truth can be helped in the government of his world by a cunning devil-born falsehood; and she succeeds in her plot, and the younger son secures the blessing."

Mr. Keary, in "The Nations Around," presents in a very attractive form some of the most instructive results of recent research in the valleys of the Nile, the Euphrates, and the Tigris, in their bearing upon the early history of the Hebrews. In the double hope of making some points of that history clearer, by hanging "the minute knowledge of ancient manners and customs, buildings and costumes, that may be learned from Egyptian and Assyrian records, round the familiar heroes of Bible stories," and of infusing life, through a collation with the Hebrew narratives, into "the minute particulars of the outward forms of living" preserved to us on the monuments, he discourses on a variety of interesting topics relating to the countries and cities, the history and mythology, of the Chaldeans, Assyrians, Phœnicians, Egyptians, and other neighbors of Israel; and he does it in a way which shows his familiarity with the best and latest productions on these subjects. Mr. Gage's hand-book on "Bible Lands," which embodies "the substance of a course of lectures delivered in the spring of 1867 before the Lowell Institute," covers a part of the same ground, but is chiefly devoted to Palestine itself, and exclusively to geographical description. Without being either an exhaustive or an elaborate work on Biblical geography, it is well enough done to achieve its object of imparting to a large class of readers "such information respecting the sacred lands as should make the Old Testament a more vivid and intelligible book."

ILLUSTRATED GIFT BOOKS.—II.*

THE names of the masters whose drawings are reproduced in Mr. Woodward's publication are all-sufficient in importance—Michael Angelo, Perugino, Raphael, Julio Romano, Leonardo Giorgione, Paul Veronese, Poussin, Dürer, and Holbein. Twenty-four of their studies are the subject of the book and make it beautiful, but its publication is accompanied by an important promise, that of publishing in such a way as to make them generally available, and with helping commentaries, the choicest drawings of the Royal collection at Windsor Castle, which, as to numbers alone, is surpassed but by two or three others in Europe. It contains above 20,000 drawings, the later Italian schools predominating in them, and with the masters of the German, Flemish, Dutch, and Spanish schools least well represented. But it is said to be unequalled for the number and excellence of Holbein's portrait-sketches and studies by Leonardo da Vinci and Poussin. There are, besides, fifty of the works of the earlier masters, many and choice drawings of the school of Venice, and some of the most important examples of Michael Angelo and Raphael.

Several drawings given in Mr. Woodward's book are already well-known by other but less accurate reproductions. His comments upon each one are excellent, and quite models in their way; they lend, as he wished it, a help to those who know much and to those who know little. Some lines of remark have been well kept to throughout, such, for instance, as the noting of that sculptural basis of decoration in picture-making which marks in European art the schools of the draughtsmen as distinguished from those of the colorists. Perhaps, while doing so, Mr. Woodward declares too definitely the intention of Michael Angelo with regard to an actual carving or casting of some of his designs, such as the one given in the book, and known as the "Shooters at a Mark." It should have been enough to insist upon the basis and the habits of his technical manner. We note also an appreciation of the continued effect of Poussin's influence in France up to the present day, and of the essential nationality of his gravity of style. Mr. Woodward's notes are certainly in the right direction towards the attaining of the object he has in view—the interesting the wider circle of those who care at all about art in the knowledge and study of the drawings of the old masters, held in such peculiar esteem by the deeper students and lovers of art. Of their critical importance, there can be no doubtful opinion. The drawings of the masters are perfect keys to their intentions, whose successful carrying out has been their glory. And if the statement seems liable to an exception in the case of the colorists, for whose meaning some scheme of colored light is needed, it is borne out by the very wants or lacunæ of their studies in line or black and white, never to be filled until the moment of the definite result. And with the draughtsmen, the full power of such a one as Raphael can never be proved to his natural opponents without the existence of his original drawings, so much do they contain over and above what those paintings carry that bear his name. What a distance, let us say, between the completed "St. Cecilia," however triumphant a success, and the tender and spiritual sketch which Marc-Antonio has preserved. Indeed, besides the fact that the sketches of the great masters are a school of instruction in the principles of art, so much so as to give the prospects of modern art-culture a most important help by their reproductions, they have a more secret value: the man who makes the artist cannot be approached as closely by any other means, so that, to a keen appreciator of these things, it is as if he mingled in unrestricted intercourse with the great poets of his admiration.

The reproduction, under Mr. Scott's direction, of some sixteen pictures by as many artists of the most influential modern school of art, even though labelled with the shop-name of "gems," might lead us naturally enough to expect a choice of some value—the choice of an expert whose instincts had been cultivated into judgment. Such help to a better appreciation and wider knowledge of modern French art and its men might well have come from an artist who has shown a love for the serious in art throughout his little book on Albert Dürer. It is certainly disappointing to find that most of the prints of the present book are of inferior work of well-known artists, or of better work by men of decided inferiority. Even if one choose to think Meissonier and Gérôme first-rate, and wilfully add thereto Hamon and Rosa Bonheur, there is no call for admitting into the same company such poor painters as Dubufe or Compte-Calix, who, in comparison, have no particular existence.

Such a disturbing mixture can only be understood through Mr. Scott's excuse—namely, that the element of popularity had to be considered by the publisher above all, as also the possibility of getting possession of the right work after it had been agreed upon, in such a way, too, as to give a chance to the photographers; which last must mean that prints were to be copied, not pictures, as these are more difficult to render. These reasons would excuse anything, but they are no substitute for a better acquaintance with the great artists of the French schools. Of course, the many-sidedness of views which has made this collective influence felt throughout Europe allows much difference of opinion as to comparative excellence. But it seems high time that the fame of those whose work has been fundamental in French art—who are intensely national and yet, by their genius, represent universal tendencies and aspirations—should spread abroad from its native country. It was to be hoped that Mr. Hamerton, for instance—whose last books are referred to by Mr. Scott as similar to and yet differing from his own—should introduce to the English-reading public the names and works of Géricault Delacroix, Dupré, Rousseau,

---

* "Specimens of the Drawings of Ten Masters, from the Royal Collection at Windsor Castle. Descriptive text by B. B. Woodward, Librarian to the Queen, and Keeper of Prints and Drawings." London: Macmillan & Co. 1870. (The drawings are reproduced by Carbon-Photographs.)

"Gems of French Art. A series of Carbon-Photographs from the Pictures of Eminent Modern Artists, with Remarks on the Works selected and an Essay on the French School, by Wm. B. Scott." London: G. Routledge & Sons. 1871.

"The Acropolis of Athens. By W. J. Stillman." New York: E. L. Godkin & Co. 1870.

Barye, or Millet. Of Delacroix, indeed, Mr. Stillman once wrote an interesting notice.

To leave these men out of the lists of French art is parallel to forgetting Turner, Blake, Gainsborough, or the Pre Raphaelites in numbering the English. To recall Mr. Hamerton, this book of Mr. Scott's differs from his in that it proceeds differently, the selection of illustrations being first and the writing second. Nevertheless, the notices are the best part of the book, and contain some pleasant talk, some natural criticism, and some errors with regard to places and dates in French history. Louises are put for Henrys, and the end of the eighteenth mistaken for the middle of the seventeenth century.

The publication of Mr. Stillman is another application of the new printing processes to the securing of photographic records whose value, in this case, requires permanence beyond a doubt. These views of the Acropolis of Athens, however interesting in their pictorial effect and beautiful as photographic results, were taken with direct reference to use as documents. By the use of orthoscopic lenses and most careful adjustment of distances, the pictures have been made to coincide with the actual measurements. Those refinements of art in directions of lines, in adjustment of spaces, and curves of surfaces, which are the exclusive difference of pure Greek architecture, and of which the Parthenon here represented is the great example, have thus been, for the first time, recorded as they appear. So that this record of the greatest monument of ancient art may outlive, in its correction, the very monument it pictures, for the comparatively recent injuries to the ruins make it to be regretted that such a work was not earlier attempted. Only a few years since, the west façade of the Erectheum was thrown down by a gale, and the eastern is in a most precarious state, while one of the columns of the west façade of the Parthenon is so badly shattered that the work of the weather or an earthquake shock, so common in Greece, may demolish the glorious structure, and leave in this book the only exact representation of it in existence. Twenty-six views are given in the book, beginning with points external to the Acropolis, which show its relation with the ancient and modern city. The title-page gives the ancient gate recently uncovered by Beulé's excavation, and then the spectator is led in a connected itinerary through the Acropolis, making the circuit through the Propylæa and the Parthenon to the eastern extremity, whence a general view is taken, and then back by the Erectheum, of which each of the four sides is given ; the final prints being an example of the sculpture from the Temple of Victory and another from the frieze of the Parthenon, thus presenting a number of aspects of the ruins which cannot but make their character and qualities clearer either to the architectural or artistic enquirer. The work has been a labor of love, and its results are offered in this book at a price which merely meets the necessary expenses of publication.

MISS GLYN.

Nature, in creating humanity, has her generous freaks and holiday humors. Once in a century or two the whim seizes her to get out a centennial or festal gift, a sort of prize edition of a woman, at which rivalry may despair and criticism forbear to cavil. When the splendor of the binding only answers to the brilliancy of the work, when to grace of person and manner is added the charm of intellect, the result is one of the great coquettes of history, one of those dread enchantresses at whose feet kings have laid down their sceptres and warriors their swords, in whose smiles poets forget their lyres, sages their books, and well-nigh saints their coronals.

Such a type is Cleopatra, the Cleopatra of poetry, at least, if not of story—a gorgeous picture of oriental luxury and sensuous abandonment, lit up with the fitful play of wit, and fancy, and petulant caprice, or the deeper glow of stern resentment and passionate fervor. No one of Shakespeare's ideal creations is more real and tangible. Beatrice and Desdemona, Hermione and Lady Macbeth, each and all may lie open to the charge of being in some sense abstractions—monographs. In each the poet may to some tastes seem to have laid almost undue stress on some one predominant characteristic in the nature of his heroine. But Cleopatra is vital throughout, instinct, in every word and act, with the warmest life and the most distinct individuality. Her charm is far from being one of mere sensuous attraction. Even should we view the story historically, in that luxurious age Rome, and Athens, and Alexandria must have swarmed with beautiful Hetairæ and graceful Gazeeyah, fair enough in their licentious inanity to enchain the passing fancy of the careless soldier. But the Serpent of Old Nile has subtler fascination. Though assured, in general terms, that the great sorceress was fair to look upon, we read in every line that her true power came from the brain and the temperament. Her magic lay less in curve of line or flush of tint than in her wit, playfulness, fickleness even, in that wonderful manysidedness, that "infinite variety" which "age could not wither nor custom stale," and in that fusing white heat of passion which terrifies but enslaves.

That such a delineation calls for great and exceptional power on the part of the actress—and perhaps even more of the reader—needs little urging. In the lack of all stage accessories, and with the laborious duty of supporting unaided through two or three hours the varied characters of so elaborate a drama, the effort must be as arduous as the triumph, if attained, would be conspicuous.

The lady who essayed this difficult task on Wednesday of last week at Steinway Hall comes among us not as a mere débutante, but with a reputation earned in many dramatic fields, and heralded with much kindly encomium from former auditors. Such an one has a right to be judged—must be judged—from a high and exacting standpoint. To an artist—and a lady—of such position we owe more than hasty or evasive comment, more damning with faint praise. She has a right to claim not only courtesy, but sincerity. The easy superficiality of the daily press, the slighting good-nature which assumes neither earnest aims on the part of the artist nor intelligent standard on that of the hearer, may be as distasteful as the severest censure. To an artist of high character, searching criticism will often be the highest compliment.

With all consideration, then, for the extreme difficulty of the task, and with all reserve for the errors of individual judgment, Miss Glyn's delineation of the Egyptian Queen, as of the other personages of the drama, did not seem to us adequate either to the requirements of the great work she interpreted or to her own traditional reputation. The lady is of a stately and commanding presence, and reads with assurance and distinctness, with good knowledge of dramatic appliances, and often with intelligence and spirit. But this general praise must be given with some admixture of limitation. Viewed as a whole, and judged, as we have said, by an exacting standard, the reading of Wednesday showed certain faults and deficiencies, which somewhat tempered commendation and interfered with an entirely hearty enjoyment.

Miss Glyn's voice, though not deficient in strength and in a certain fulness in energetic passages, lacks something of that peculiar level *sostenuto* and mellow vibration which are so effective in the delineation of intense feeling. Her delivery is clear and measured, but is apt to become a little monotonous and conventional, and, in the attempt to secure impressiveness, is sometimes unduly protracted. Among many instances of this, the one which most readily occurs to us is the passage in Act I., where Cleopatra exclaims to Charmian—

> "What should I do, I do not?"

Here, that the ear of the listener may properly supply the omitted relative, the pause between the two clauses should be extremely slight. Miss Glyn, on the contrary, prolonged it so as to make of the passage two entirely distinct and unrelated sentences, to the injury of the meaning. In the next speech, the sharp, fierce rejoinder—

> "Thou teachest like a fool: the way to lose him!"

the same over-solemnity in reaching after impressiveness tended to mar the force of the line.

On the other hand, in passages of great intensity and fire, the reader adopted an air of calmness, with a humorous or mocking expression of feature, which differs from the accepted interpretation of the part. Such culminating flashes of savage energy and passionate wilfulness as the lines—

> "Who's born that day
> When I forget to send to Antony,
> Shall die a beggar!"

and further on—

> "By Isis, I will give thee bloody teeth
> If thou with Cæsar paragon again
> My man of men!"

were read far too quietly. They are angrily direct and vehement, not sarcastic.

Neither in the matter of mere mechanical emphasis does Miss Glyn quite do justice to her professional training. Her reading shows an occasional tendency to get the stress on words where it does not fairly belong, especially on small conjunctions and pronouns, not properly emphatic, and to omit it where so doing runs the risk of marring a "point." Of many instances of this one must suffice, where Cleopatra says to the messenger of Anthony's marriage—

> "Though it be *honest*, it is never *good*
> To bring bad news"—

and where the reader, having given the full emphasis to *honest*, seemed to us to lose the color and vigor of the antithesis by omitting it in the correlative *good*.

It is certainly within the limits of possibility that a reading might have such minor faults as these, yet be, in general conception, in the informing spirit and fire of the whole treatment, so strong and imaginative as to sweep away all carping or pedantic criticism of details. On such a point there will probably be almost as many varying shades of opinion as auditors, but to the careful Shakspearian student Miss Glyn's conception of the fervid Oriental and of the proud Roman might probably leave something to be desired. Her reading as well as her acting of the wonderfully lifelike scenes in the earlier portions of the play—the chameleon-like changeableness and caprice, the teasing yet violent temper, the alternate sulks and sunshine of the moody princess, were not quite as imaginative as we had hoped from her, and as they probably would have been in the larger liberty and warmer dramatic atmosphere of the stage. Neither in her smiles nor her frowns did she quite recall the "royal wench" in whom "vilest things become themselves." It was rather modern and realistic than antique and Oriental. Her portrait of Antony, too, lacked something of the rugged earnestness and impetuosity which one might expect in the bluff, headstrong soldier and haughty but tender lover and master. It seemed rather feminine than masculine.

Among the merely mechanical causes tending to hinder a full enjoyment of Miss Glyn's interpretation was the length of the play. The leisurely afternoon audiences of the Globe and the Bankside were of steadier stuff than those of modern times, and would sit through a whole historical episode, of which even a sketch and insufficient abstract tries the hastier temper and weaker attention of the nineteenth-century listener. Still another impediment, both for reader and hearer, was the undue size of the room. The mutual and, so to speak, magnetic sympathy of the two parties to the bargain is, to a certain extent, one of local relation. The reader needs to feel at home with his audience and they with him. But how is one to feel at home with, or even be properly heard and seen by, a thousand people or more scattered over the vast expanse of Steinway Hall? What moral telegraph shall knit together with its electric chain a listening people spread over such a continent of benches, corridors, and galleries? We cannot help hoping for an occasion to revise our judgment in "cosier" and more sympathetic surroundings.

NOW READY.

A SHORTER COURSE IN

ENGLISH GRAMMAR.

BY SIMON KERL.

Author of "Common School Grammar," "Comprehensive Grammar," "Composition and Rhetoric," etc.

1 vol., 240 pages, price 80 cents.

This work aims to be just such a manual as the great majority of schools and academies now require. The classification is exceedingly compact, and all that belongs to the same topic is carefully grouped together. It is specially adapted for use in schools where only one text-book in grammar is desired.

We shall be pleased to have the work extensively examined by teachers, and for this purpose we will send it, free of postage, on receipt of *half* the above price.

RECENTLY PUBLISHED.

ELEMENTS OF

Composition and Rhetoric.

BY SIMON KERL.

Author of "First Lessons in English Grammar," "Common School Grammar," and "Comprehensive Grammar."

1 vol. 12mo, 400 pages, price $1 25.

This is a simple, concise, progressive, thorough, and practical work on a new plan. It occupies an intermediate position between Common Grammar and Higher Rhetoric, and has been commended by many eminent scholars and critics as the best work of the kind now published.

We shall be pleased to furnish it, free of postage, for examination, with a view to introduction, at half retail price.
